

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

RESEARCH METHODS

A series of experiments were conducted to determine the effect of the different factors on the rate of learning.

RESULTS

The results of the experiments are shown in Table 1. The first column shows the number of trials required for the subjects to learn the task. The second column shows the number of trials required for the subjects to learn the task when the different factors were present. The third column shows the number of trials required for the subjects to learn the task when the different factors were absent. The fourth column shows the number of trials required for the subjects to learn the task when the different factors were present and the fifth column shows the number of trials required for the subjects to learn the task when the different factors were absent.

PREFACE.

ONE of the most notable features in this volume of the *ANNUAL CYCLOPEDIA* is to be found in the group of patriotic articles—the Grand Army of the Republic, the Loyal Legion, the United States Medal of Honor, and Memorial Day. The article on the Medal of Honor is especially valuable from the fact that it presents lists (not accessible elsewhere) of the soldiers and sailors who have received the medal. These articles are illustrated with a brilliant colored plate. Another illustrated article of special interest is that on Modern Houses, which shows the wonderful progress in American domestic architecture, with views of some of the finest residences that have been erected in recent years. At the other end of the social scale we find the remarkable series of Strikes, which are classified and set forth in a way to be convenient for ready reference. The Disasters and other Events of the year are also recorded briefly in chronological order. Among the articles that will be found timely this year are those on the laws, customs, and theories of Elections, on the Fisheries and treaties relating thereto, and on the Interstate Commerce Law, the last named being from the pen of Hon. Thomas M. Cooley, chairman of the Commission. Closely related to these is the learned article on Treaty-making Power of the United States. In relation to education, we have the articles on Industrial Education, Indian Education, Mind-Reading, Physical Training, and Volapük. Among the organizations treated are the Law-and-Order League, the Ancient Order of United Workmen, Mutual Aid Societies, and the White Cross Society. The scientific articles include that on Astronomical Progress and Discovery, by Prof. Harkness, of the Naval Observatory at Washington; Chemistry and Metallurgy, by Dr. William J. Youmans, editor of "The Popular Science Monthly"; those on Emery-Wheels and Engineering, by Col. Charles L. Norton; that on utilizing the power of Niagara Falls; and the description of the new Croton Aqueduct. Among the industrial topics treated are those on Photo-Engraving, Porpoise-Hunting, Postal Facilities, Salt-Mining, and Tree-Planting. The special articles, on subjects not treated every year, include those on Domesticated Buffalo, Guns for Coast Defense, Library Laws, Polo, Records of the Turf, and Prison Reform. Besides the usual general article on Patents, some of the inventions of popular interest are treated, including Mechanical Carriers, Naphtha Motors, and the mysterious Keely Motor. The necrology of the year includes Henry Ward

Beecher, the greatest of pulpit orators; Alvan Clark, the most successful telescope-maker; Spencer F. Baird, Secretary of the Smithsonian Institution; James B. Eads, the eminent civil engineer; Gen. William B. Hazen, head of the Weather Bureau; Roswell D. Hitchcock and Mark Hopkins, the eminent scholars; Jenny Lind, the greatest singer of her time; Lord Lyons, the British diplomatist; Ulysses Mercur and William B. Woods, jurists; John Roach, the greatest of American ship-builders; James Speed, of President Lincoln's Cabinet; Emma Lazarus, John G. Saxe, and Benjamin F. Taylor, poets; William A. Wheeler, ex-Vice-President; Bishops Lee and Potter, Catherine L. Wolfe, Elihu B. Washburne, and Edward L. Youmans. Portraits of all these and others will be found in the volume, and an unusually large number of brief sketches of those who passed away during the year. The three portraits on copper—of Henry Ward Beecher, President Sadi-Carnot, and the new Emperor of Germany—were etched by Valerian Gribayedoff. The portraits in the text were drawn by Jacques Reich, whose fine work has been so noticeable in the new "Cyclopædia of American Biography."

The article on Recent Growth of American Cities is continued from last year, and the numerous regular topics that are treated every year have been carefully and fully discussed by competent writers, most of whom are regular contributors, and keep track of the subjects from year to year. An Index for this volume will be found at the end, and a combined Index for the twelve volumes of the series is issued separately.

NEW YORK, *April 2, 1888.*

THE ANNUAL CYCLOPÆDIA.

A

ABYSSINIA, a monarchy in Eastern Africa, having an area of about 200,000 square miles, and a population estimated at 4,000,000 souls. The monarch, who is called the Negus, is Johannis, or John, formerly prince of the province of Tigré, who, after a period of civil warfare following the British invasion of 1868, was proclaimed king in 1872.

Treaty with England.—During the operations for the withdrawal of the Egyptian garrisons from the Soudan in the early part of 1884, concessions were offered to the Abyssinian Negus for the removal of the long-standing differences between him and the Egyptian Khedive. A formal delimitation of the frontier was offered, which would restore to him the territory of Bogos; also free transit for all goods, including arms and ammunition, through the port of Massowah, under British protection. It was further agreed that all difficulties in the matter of supplying an Aboona, or high-priest, for Abyssinia from one of the Coptic churches of Egypt should be removed. For these concessions King Johannis agreed to facilitate the retreat through his territory of the Egyptians at Kassala and other posts in the neighboring parts of the Soudan. All future disputes between Abyssinia and Egypt were to be referred to the British Government for arbitration. A treaty containing these provisions was concluded by Admiral Sir William Hewett as special British envoy. The Abyssinians subsequently more than redeemed their promises, not merely granting passage to the garrisons of Gallabat and Ghirra, but actively intervening for their rescue, and making a brave attempt to succor the Egyptians at Kassala.

The Italians at Massowah.—The port of Massowah, which had formerly been an object of dispute between the rulers of Abyssinia and the Khedive of Egypt, was taken possession of by Italy, with the concurrence of Great Britain, when the Egyptian garrisons were withdrawn from the Soudan, the Italians undertaking to carry out the British agreement

respecting the transit of merchandise. The Abyssinians did not desire to possess Massowah, not being able to hold so distant a post, and were willing that it should remain in the possession of Great Britain, but grew jealous when it was handed over to the Italians, whom they immediately suspected of aggressive designs on their territory. Their suspicions increased when the Italians established friendly relations with the Habab tribe, which was in rebellion against the Abyssinians, and when they occupied places in the surrounding country for the troops that had been in dispute between the Abyssinians and Egyptians, but which the latter had never gone so far as to take possession of. King John sent a letter to the Queen of England, complaining of these acts, and asserting that the Italians obstructed the transit of goods. The Italian Government dispatched an imposing mission, in the beginning of 1886, to confer with King Johannis, and conclude a treaty similar to that made by the English. The Italians were willing to increase the concessions already granted, and desired in return to extend their settlements so as to include healthful quarters for their soldiers in the district of Keren, situated in the uplands near Massowah. The English Government determined on sending an envoy to accompany the Italian officers for the purpose of making explanations that would help to bring about a good understanding between the Italians and the Negus, and also of conveying presents and expressions of gratitude for the aid given by the Abyssinians in extricating the Egyptian garrisons. The Italian envoys were recalled, when it became evident that they would not be cordially received. The Englishman proceeded alone, and at Asmara, the first Abyssinian village, met Ras Aloula, the King's general, who was incensed at reports of Italian encroachments, and threatened to attack their advanced positions. The envoy found the Negus also annoyed. No steps were taken by the Italians, after their rebuff, to remove the cool-

ness, or to allay the suspicions, which were fomented by Frenchmen and Greeks in Abyssinia, and by the Arab sheiks whose territory lies between Abyssinia and the sea.

Attack on Italian Troops.—The post of Saati was occupied by bashi-bazouks when the Italians took possession of Massowah. The Abyssinians complained of the occupation, but at length connived at it, because the bashi-bazouks gave protection to their caravans. In January, 1887, Gen. Gene, the commander of the Italian forces in Africa, made arrangements to forward European troops to Saati. Ras Aloula collected an army without the knowledge of the Italians, and marched upon Keren. Gen. Gene, in his dispatches giving intelligence of the hostile movement, said that he had means more than sufficient to repel any force that the Abyssinians could send against him. In a later dispatch he asked for a re-enforcement of 600 men, in order, if necessary, to make a military demonstration. The Ras sent a messenger to warn the Italian commander to evacuate the advanced forts, and to limit the occupation to Massowah, threatening to throw into chains Count Salimbeni, the leader of a scientific expedition to Abyssinia, if this were not done. On January 19 the Abyssinians attacked the Italian outposts at Monkullo. In a combat lasting four hours, more than half of their force, which numbered 300, were slain. Of the Italians five were killed, and three made prisoners. One of the prisoners was sent back with a letter saying, that if the Italians wished peace they must remain in Massowah. The commandant replied that peace was not desired on such conditions.

A day or two afterward a force of 1,500 men of all arms was sent out from Monkullo to succor Saati, and prevent that post from falling into the hands of the Abyssinians. Near Dogali the column, which was commanded by Col. Decristoforis, was attacked on January 24 by Ras Aloula's entire force. The Italians could not work their machine-guns, and sent back to Monkullo for more men and mitrailleuses. One of the two companies forming the garrison was dispatched under the command of Capt. Tanturi, but, before the re-enforcements came up, Col. Decristoforis's three companies were utterly routed. The bashi-bazouks fled in the beginning of the engagement. The Italian soldiers formed into a hollow square, and defended themselves as long as their ammunition lasted. The Abyssinians, who were said to number 20,000 men, had many Remington and Martini rifles. After the rout of the Italians, they withdrew to the hills. The Italian losses on the 25th and 26th were 23 officers and 407 men killed, and one officer and 81 soldiers wounded. Ras Aloula is said to have made the attack without the sanction of the Negus. A letter was dispatched, on January 26, by King Johannis, who said: "In the first place you took Wuas, and now you have come to Saati to erect a fortress. What object have

you? Is not this country mine? Evacuate my country if you have come by orders. Why erect fortresses? You bring what is abundant with you—cannon, muskets, and soldiers." Ras Aloula, after the battle, returned with his troops to Asmara, whence he sent one of his prisoners, Maj. Piano, with a letter, saying: "What has happened was caused by your tricks. Let us now be friends, as in the past. Remain in your own country. All the region between Massowah and here belongs to the Negus."

The Conquest of Harrar.—Simultaneously with Ras Aloula's movement, King Menelek, of Shoa, led his army against Harrar, which had been restored to the hereditary ruler by the English, and was an object of Italian aspirations. The Emir's troops were met near the frontier and put to flight. When Menelek encamped before the city, the inhabitants sent an Italian merchant with an offer of surrender, and prayers for clemency. The Abyssinians thereupon entered the town and took possession without pillage or bloodshed. King Menelek remained in Harrar several weeks, and when he departed left a garrison of 4,000 men. The Negus and his son, with large bodies of soldiers, attempted the conquest of other parts of the Soudan.

The Dispatch of Re-enforcements.—In response to Gen. Gene's first request for re-enforcements, 800 men were sent from Italy, with 120 Gatling guns. They landed at Massowah on February 15. The Italians had raised a force of 1,000 bashi-bazouks, and had distributed arms among the inhabitants. With the new troops from Italy the strength of the garrison was about 2,500 Europeans and 1,500 natives. The news of the reverse at Dogali was communicated to the Italian Chamber on February 1, and a credit of 5,000,000 lire was voted for the dispatch of fresh troops. The second detachment of 2,000 soldiers reached Massowah on February 22. The credit was granted only on the understanding that there should be no extension of operations beyond the occupied posts. On March 12 another detachment, numbering 666 officers and men, was sent out.

Negotiations with Ras Aloula.—Maj. Piano returned to the Abyssinian camp to treat especially for the release of Salimbeni and his party. Count Salimbeni himself was allowed to go to Massowah to arrange for the payment of a ransom. Ras Aloula sent word, in the latter part of February, that he would not attack the Italians provided they remained at Massowah, Monkullo, and Arkiko. In March, Gen. Gene agreed to the conditions demanded for the release of the Italian prisoners, which were the delivery of 1,000 rifles that had been seized as contraband by the customs authorities, and the surrender of five Arabs belonging to a tribe friendly to the Italians. The Arabs were executed by the Ras, and the tribesmen were incensed against the Italians. All the members of the scientific party were released, with the

exception of Count Savoironx, who was detained by Ras Aloula to act as his physician.

The Change of Commanders.—The Italian Government ordered Gen. Gene to establish an effective blockade, with the object of preventing the importation of arms into Abyssinia. Count Robilant sent a dispatch severely censuring the commandant for purchasing the freedom of the prisoners by the surrender of arms and fugitives, and soon afterward sent Gen. Saletta, the first commander of the Italian troops in East Africa, to relieve him of his post. An Abyssinian bishop, the head of the Order of Jerusalem, while returning from a pilgrimage to the holy city, was detained by Gen. Gene as a hostage for the safety of Maj. Savoironx. Letters from the Negus and his general to the French consul, M. Saumagne, proved that he had carried on a hostile intrigue, though he had been formally instructed by his Government to facilitate their settlement at Massowah. In consequence of this revelation, he was removed from his post. Gen. Saletta arrived at Massowah in the middle of April, and took over the command on April 23. He notified the merchants in Massowah to recall all their agents in Abyssinia, as he intended to declare a blockade by sea and land. On May 2 he proclaimed martial law, and on the following day announced the blockade of the coast from the Bay of Hamfla on the south to the point opposite the Difnen Islands on the north. A prize court was instituted at Massowah to deal with vessels breaking the blockade. The Negus appointed Ras Aloula governor-general of the Taccaze country as far as the Red Sea, excepting the province of Makalle. Rifles of an improved pattern were distributed among the soldiers of the Ras, and all commerce with the Italians was prohibited on pain of death. On July 11 the Italians lost about 600,000 francs' worth of ammunition by the explosion of their powder-magazine, which was supposed to have been set on fire by Abyssinians to avenge one of their countrymen who was shot as a spy. There were 10 persons killed and 75 wounded by the explosion.

Offer of Mediation.—On July 12 the British Government communicated its readiness to act as mediator between Italy and Abyssinia, and the Italian Government accepted the principle of British mediation in its answer, given before the end of the month. No movement was undertaken by either side during the summer; but in August the Italian Government chartered steamers for the dispatch, if necessary, of 10,000 troops in the autumn. The Mohammedans on the coast were generally willing to join the Italians against the Abyssinians, and treaties were made by Gen. Saletta with several Arab tribes.

ADVENTISTS, SEVENTH-DAY. The following is a summary of the statistics of the Seventh-Day Adventist denomination, by Conferences, as given in the "Seventh-Day Adventist Year-Book" for 1887:

CONFERENCES.	Ministers.	Churches.	Members.
California	14	85	1,750
Canada	1	5	187
Colorado	2	5	200
Dakota	6	22	594
Denmark	4	9	177
Illinois	8	80	784
Indiana	8	40	1,004
Iowa	14	61	1,550
Kansas	18	45	1,701
Kentucky	5	6	128
Maine	4	21	480
Michigan	28	128	4,067
Minnesota	15	68	1,584

Virginia	3	5	120
Wisconsin	12	49	1,522
Missions.			
British	5	8	122
General Southern	5	..	820
Scandinavian	8	8	175
Total	218	798	23,111

Besides the ministers, 166 licentiates were returned. The whole amount of Conference funds was \$146,986. The reports show increase from the previous year of 27 ministers, 15 licentiates, 57 churches, 2,564 members, and \$24,295 in Conference funds.

The International Tract and Missionary Society reported 12,512 members, 247 cities entered by Bible workers and colporteurs, \$59,106 received on account of the tract and missionary fund, \$27,551 received on account of periodicals, \$6,815 on account of the tract and missionary reserve fund, \$28,579 pledged and \$20,965 paid for home work, \$67,851 pledged and \$18,981 paid to other enterprises, and an excess of \$62,856 of resources over liabilities. City missions in 36 cities and towns employed 102 "experienced workers." The General Sabbath-School Association, at its anniversary meeting, adopted a form of constitution for State Associations. The American Health and Temperance Association had on its rolls the names of nearly 15,000 members. The Central Seventh-Day Advent Publishing Association returned a net gain from business during the year of \$11,849, and a present valuation of \$166,520. Its accounts were balanced at \$348,588. The Pacific Seventh-Day Advent Publishing Association returned a capital of \$49,692, and total assets valued at \$175,741. The Seventh-Day Adventist Educational Society reported the present value of its property and resources as \$56,156. About 175 students of the college were attending Biblical lectures. Healdsburg College returned an excess of \$15,839 of assets over liabilities. The net resources of the Health Reform Institute were returned at \$178,014. The average number of

patients had exceeded 200. A "Rural Health Retreat" was also sustained at St. Helena, Cal. A the meeting of the European Missionary Council, held in Great Grimsby, England, in September and October, 1886, reports were made of the condition of the denominational work in the Scandinavian countries, in all three of which were 22 churches, 602 members, 809 Sabbath-keepers, 288 Sabbath-school members, 9 ministers, and 16 colporteurs; and \$1,228 had been realized from tithes and donations. Tent-work had been carried on in England—not so successfully as in the previous year—and in France and Italy.

General Conference.—The twenty-fifth General Conference of Seventh-Day Adventists met at Battle Creek, Mich., Nov. 18, 1886. Elder George I. Butler presided, and presented at the opening session, reports on the work of the denomination in the United States and foreign countries. Besides missions in various parts of the United States, special accounts were given of missions in Australia, South Africa, England, Scandinavia, and other parts of Europe. Attention was invited to the Maoris of New Zealand as a suitable people among whom to establish a mission, and to the expediency of publishing a paper in their language. The reports were accepted by the Conference as indicating a more rapid spread of "The Third Angel's Message" than had ever been known before, and, with the "persecutions to which the Seventh-Day people were subjected," of the approaching culmination of the Adventists' work. The hearty Christian sympathy of the Conference was tendered to the brethren who were suffering persecution, and they were urged, with "others upon whom the same things may come, to be in nothing terrified by the adversaries." It was resolved to begin labor among the Hollanders in the United States, and the publication of a paper in the Dutch language was advised. The publication of a book of plans for buildings for church societies was directed. Resolutions were adopted recommending to persons in charge of city missions, to introduce foreign departments into their work; that all persons connecting themselves with missions, "should, before going, bring their wearing apparel into harmony with the teachings of the Bible, and the testimonies on the subject"; that at each camp-meeting at least one session should be devoted to the subject of education, and special effort should be made to induce youths to attend the denominational schools; directing the establishment of a Labor Bureau at Battle Creek; advising the opening of missions in South Africa, South America, and British Honduras, and calling for \$100,000 during the year, in addition to pledges already made, for missionary operations; recommending the institution, at the denominational schools and academies, of special courses for young ministers and persons engaged in evangelistic labors; especially

insisting upon the importance of the health and temperance branches of the denominational work; relating to the appointment of reporters of the proceedings of camp-meetings, and other meetings, with reference to securing the critical correctness of translations of denominational writings into foreign languages; declaring the rebaptism of persons who have been "properly baptized" before "embracing the message," not to be necessary; and approving a publication called the "Chart of the Week," as "an incontrovertible testimony to the unbroken continuity of the creation week, an unanswerable argument to the Sunday theory, and a positive proof of the perpetuity of the Seventh-Day Sabbath, showing, that out of more than one hundred and fifty languages and dialects, the large majority recognize Saturday as the Sabbath."

AFGHANISTAN, a monarchy in Central Asia. The ruler, called the Ameer, is Abdurrahman Khan, who was placed on the throne by the English after their conquest of the country in 1879. He receives a regular subsidy of about \$50,000 a month from the Indian treasury, and is under a treaty engagement to follow the advice of the Viceroy in his relations with foreign powers, while the British Government is under obligation to give him military assistance in case of an unprovoked aggression on his territory.

The Ghilzai Revolt.—Abdurrahman has made use of the money and arms given him by the English in an endeavor to establish a firm authority over his immediate subjects, the turbulent and independent Afghan tribes. The Ameer, a man of stern and resolute disposition, was guided in his policy by the conviction that Afghanistan would lose its national existence in the conflict between Russia and England unless the tribes were united and controlled by a single autocratic will. The tribes have never been subservient to a central authority, and are unwilling to pay taxes, or to recognize any master superior to their own chiefs. The Ameer imposed a tax of ten rupees on every marriage of a daughter and every son born, and five rupees on every widow married, every girl born, and every man migrating to India for employment. The attempt to exact imposts stirred a section of the Ghilzais—the strongest and most independent of the Afghan tribes—into rebellion. Some of the southern Ghilzais expelled the Ameer's officers, and rose in arms in the autumn of 1886. The Afghan commander-in-chief, Gholam Hyder Charkhi, marched against the insurgents, and was successful to the extent of securing the safety of the road between Cabul and Candahar. During the winter, military operations could not be carried on; but in the spring of 1887, the revolt broke out afresh, and extended to most of the Ghilzai tribes south of Ghuzni.

The Ameer, who already possessed a good disciplined army, well armed and drilled, provided with artillery, and commanded by faith-

ful lieutenants, whose fortunes were bound up in his own, prepared in the early spring for a vigorous campaign against the insurgents, and for the defense of his frontier against any sudden movement of Russia. He raised new regiments, mostly among the Duranis of the Candahar province, called on all his subjects over eighteen years of age to enlist in the army, and issued a manifesto, which was at first reported to contain the proclamation of a Jihad, or holy war, but which was really a statement of the dangers arising to Afghanistan from the rivalries of European powers, and a patriotic and religious appeal for union and loyal submission in face of the national peril.

The disturbances were begun again near the close of March by the Hotak section of the Ghilzais, holding the country about Khelat-i-Ghilzai, who seized some officers sent from Candahar to levy fines, and killed the governor of Maraf who was leading a force against them. Sikundar Khan marched from Candahar with a large force for the purpose of occupying the hilly district of Attaghar, where the defiance to the Ameer's authority occurred. It is situated about one hundred miles east of Candahar, and the same distance north of Quetta. The Ghilzais in the neighborhood of Ghuzni also rose in great force about the 1st of April, and held the road between Cabul and Candahar. Gholam Hyder Orakzai moved out from Ghuzni against these insurgents, who were assembled at Mukur, about a third of the distance between Ghuzni and Candahar. The Andak and Tarak tribes fell upon Gholam Hyder Khan, who was in pursuit of a rebel chief, and killed him and 200 horsemen. To avenge his death, Purwana Khan, who, though not a soldier by profession, was held to be the ablest of the Ameer's generals, was sent with 3,000 men, and was defeated at Nani, a short distance to the south of Ghuzni. The force led by Gholam Hyder Orakzai had an encounter with the rebels, who were driven back upon the hills, leaving the road to Candahar free again; but the general was afraid to pursue, and, fearing that they would return to the attack, intrenched himself in the plain. Sikundar Khan was attacked by the Hotaks on April 12, and compelled to retire from the Ghilzai district, and go into intrenchments near Maruf, so as to maintain his communications with Candahar through the Durani country. The Ameer's troops were beaten at first, and some of them fled to Khelat-i-Ghilzai; but the rest finally made a stand, forming a breastwork of their camels. All the sections of the Ghilzai tribe south of Shutargardan Pass joined in the rebellion, as well as the Jaowri Hazaras. The Hotaks and Andaris took the lead, but the movement spread to the Tarakhis and the Tokhis. Troops were withdrawn from the Jelalabad district to be sent against the southern insurgents, and presently the Shinwarria, who had been uneasy for some time, and whom the Ameer's commander-in-chief was trying to

pacify, broke into open revolt when the Ameer's officials attempted to enforce the payment of taxes. Abdurrahman, who is afflicted with an organic disease, fell ill about this time. Secret intelligence passed between the insurgents and various pretenders to the throne, especially Ayub Khan, who was interned in Persia. About the end of April a defeat was inflicted on the royal troops by the Shinwarria near Jelalabad. Two other attacks were made, and some damage inflicted by the rebels on the forces in the south. On the 15th of May Gholam Hyder Orakzai effected a junction with Sikundar Khan, and their combined forces, estimated at 4,500 infantry and cavalry, with 8 guns, encamped at Karez-i-Ahu, at some distance from Attaghar, where they were confronted by 4,000 Ghilzais. The opposing forces remained for several weeks in their respective camps. The Ameer's troops made raids through the Hotak country, burning villages, and even destroying the fruit and almond orchards, which are the main source of wealth of the inhabitants. Finally, Gholam Hyder Orakzai moved northward to prevent a junction between the Tarakhis, who were gathering in large numbers, and the Hotaks. When he had gone, the rebels plundered the Durani villages of Maruf. Gholam Hyder went first to Shinkhai to reopen communications with Ghuzni, and on June 11 moved eastward to disperse the gatherings of Tarakhis, Tokhis, and Nasiris in the plain north of Lake Abiistada. On the 18th he met them at a fortified position called Katakhan, and was repelled. Three days later he marched against a force of Tarakhis and Nasiris, and defeated them, killing 300. In June a Ghilzai chief named Tamar Shah, who was second in command, led a mutiny in the garrison of Herat. A regiment of Ghilzais attempted to kill the governor and seize the town. The mutiny of other troops was arranged, but the governor attacked the regiment that took the lead, and drove them from the town, after the mutineers had provided themselves with breech-loading rifles and cartridges from the arsenal. A detachment was sent from Candahar to intercept them, but they succeeded in joining the main body of the rebels at Nawai Tarakhi. Their leader fled toward Persia, but was captured and sent to Cabul. There were many encounters between the Ameer's forces and the rebels. The latter ventured several times to attack the troops on the plains, but lost heavily. The Ameer had proclaimed them outlaws, and the heads of the slain were sent by the hundred to Cabul. The troops dared not attack them in the hills, and were kept busy marching and countermarching to defend the points that were successively threatened. Gholam Hyder attempted to cut off the Andari mutineers when they moved southward from Nawabi-Tarakhi to join the Hotaks and Nasiris at Attaghar. A combat took place on July 25 at the pass of Kotal-i-Ab, by which the

road from Khelat-i-Ghilzai crosses the Sura mountains. The rebels had fortified the pass, and were there in considerable force, but were outnumbered and gave way before re-enforcements arrived, after inflicting heavy losses on the royal troops. There was another fight on August 3, in which the Ameer's general was worsted and forced to retire to Khelat. A large part of Abdurrahman's army was composed of Andari Ghilzais, and military discipline was not strong enough to overcome the spirit of the clan. No Ghilzai troops were sent against the rebels. After the mutiny of the Andari regiment, the other Cabuli troops in Herat were sent out of the town. The ring-leaders of the mutiny were captured and sent to Cabul, but the Ameer did not dare punish them, for fear of provoking a general mutiny of their fellow-tribesmen, with the exception of Taimar Shah and two other officers, who were executed for holding treasonable correspondence with Ayub Khan. The Herat garrison was recruited from the neighboring peoples, who can not be relied on for soldierly qualities, nor for loyalty to the Ameer of Cabul. The attempt of the Ameer to awaken a religious spirit in the northern Afghan country with the help of the mollahs was a failure, for his despotic rule was thoroughly unpopular, and the friends of the pretenders drew an effective contrast between his and Shere Ali's reign. The Duranis of the Candahar province had thus far escaped the Ameer's exactions, and were still faithful; yet the attempt to raise fresh regiments among them was not successful, because they are averse to a military life. The bulk of the Ameer's army remained in the north, where, notwithstanding the re-enforcements sent to the southern garrisons, Gholam Hyder Khan had about 20,000 regular troops, while the forces under Hyder Orakzai and Sikundar Khan numbered about 7,000 men, and the garrisons of Ghuzni and Candahar, 5,000. The Shinwarris, led by the Sirdar Nur Mohammed Khan, who, after first gaining possession of the Khost district, joined them with a large body of recruits, held their own country against the forces sent against them from Jelalabad by Hyder Gholam Khan.

The British Strategic Railways.—The rails of the Sibi and Quetta sections of the Sind-Pishin Railroad *via* the Harnai route were joined on March 14, 1887. The alternative Bolan road was still far from complete. The line over the Harnai Pass is a superior engineering work, comparable, except in the point of length of tunnel, with any of the mountain railroads of Europe. The highest point is 7,000 feet above the sea. By means of the Quetta Railroad the Indian Government is enabled to place all the supplies for an army of 100,000 men within one hundred miles of Candahar. Surveys have been made for a military road from Dera Ghazi Khan through the Bori valley to Pishin. A short line of railroad from Peshawur to Jamrud on the Afghan frontier, at the entrance of

the Kaiber Pass, is in progress. Two branches of the Quetta line extend across the Pishin valley to Gulistan and Kiela Abdula, at the foot respectively of the Gwajja and Khojak Passes in the Khojah Amran range. The expenditure on the Harnai and Bolan lines, from 1885 to the close of the financial year 1886-'87, was about \$19,000,000. Surveys for the extension of the line beyond the Khojah Amran mountains have been made. The route over the Khojak Pass is the more direct one, while the Gwajja Pass presents fewer engineering difficulties. To extend the road into the country of the Afghans, the British must be prepared to carry out a military occupation, which they are not likely to undertake until a crisis in Afghan affairs renders it necessary. The Duranis attacked their stations and survey parties several times in the early part of 1887. The Ameer appointed khans in that district who would be favorable to the English, but he has no power to facilitate the entrance of their railroad into Afghanistan, and only incurs the contempt of the Afghans by his subservience. On January 8 the Duranis, with the concurrence of the Governor of Candahar, attacked the post of Kiela Abdula, with the intention of killing the British political officer and the engineer of the railroad. They did not find those officers, but destroyed the telegraph, and killed the local khan and one hundred railroad laborers. When work was begun on the extension of the road from Gulistan to Chaman Chauki, the head of the Khojak Pass, every one from Quetta was required by the Governor of Candahar to find security for his future conduct.

The Trans-Caspian Railway.—The strategic railroad from the Caspian Sea across the Turkomanian desert, which was begun in 1880, was completed as far as the Oxus in the spring of 1887. It is to be continued thence to Samarcand, a total distance of 1,335 versts from the coast. The island of Usun Ada, twelve miles to the west of Mikhailovsk, was selected as the starting-point, neither Krasnovodsk nor Mikhailovsk being suitable on account of the steep hills surrounding the one and the shallow harbor of the other. Usun Ada harbor has twelve feet of water. It is eighteen to twenty hours by steamboat from Baku. The foundation for portions of the road running across the shifting sands between the coast and Kizil Arvat, about two hundred versts, was made by watering the sand with sea-water, and laying over it clay dug from the steppes. There were as many as 5,000 Russians and 20,000 Asiatics employed on the work at one time. The naphtha-springs, which are as numerous and productive on the eastern shore of the Caspian as in the Baku district, supply an abundance of *astatki* for heating the locomotives. A line of rails runs from the station of Bala Ishem to the petroleum-springs, from which the fuel is brought, only thirty-five versts away. There are five wells opened, yielding 5,000 poods of naphtha daily. Between the oases of Akhal and Merv

the road passes through a level country, which, notwithstanding some strips of desert, presented no serious engineering difficulties; but between Merv and Chardjini it had to be laid across a waterless desert, a length of 232 versts. At Dushakh, where the line turns eastward toward the river Tejend, a branch line to Herat, by way of Sarakhs, will be constructed some day. The Oxus at Chardjini is one and a half verst wide, and is crossed by a steam ferry-boat.

Beyond Chardjini a steppe, twenty versts across, required large quantities of water, taken from the Oxus, to fix the deep, shifting sands. Through Bokhara the line is traced along the edge of the cultivated country, so as not to interfere with the irrigation-works. The time required for the journey from Tiflis to Samarcand will be about three days and a quarter. The railroad already constructed enables the Russians to transport troops and war material from Odessa or any other point in Southern Russia to the Tejend in five days, and thus reach Herat sooner than could the English, even after extending the Indus Railroad to Candahar.

The Council of the Empire appropriated the money for the extension of the railroad to Samarcand. Gen. Annenkoff went to Asia in July, 1887, to prepare for the construction of the last part of the line, which could not be begun before autumn, but will be completed before the summer of 1888. The portion of the line running through Bokharan territory is 300 versts; and that in Russian Turkistan beyond, eighty-five versts. Before this last section of the railroad was begun, the military center of Asiatic Russia was transferred from Tashkend to Samarcand.

Russian Occupation of Kerki.—The town of Kerki, situated on the left bank of the Oxus, on the main road between Bokhara and Herat, was occupied by a Russian detachment under Gen. Ozan Tora, commander of the Samarcand army in May, 1887. This fresh advance of the Russians caused much disquiet in England, and increased the difficulties of the Ameer's position in Afghanistan. Yet no question of an encroachment on Afghan territory could be raised, because the Afghans, who succeeded in extending their sway over Maimena and Andkhol, never held Kerki, nor brought under their rule the Ersari Turkomans inhabiting the district, which formed a part of the outlying dominions of the Emir of Bokhara. The Russians did not proceed to occupy the place without the latter's consent. Kerki is an important strategical position, and brings the Russians in contact with the discontented Turkoman and Uzbek subjects of the Ameer. The British Government was informed of the intended occupation a month before it was carried out, the Russian Foreign Office declaring that it was done in order to protect the flank of the Asiatic Railroad.

Ayub Khan.—When Yakub Khan, the son and

successor of Shere Ali, abdicated in 1879, after the murder of Sir Louis Cavagnari, his brother Ayub declared himself the enemy of the English and of his cousin Abdurrahman whom they set upon the throne. He led the Afghans, defeated Gen. Burrows on July 27, 1880, and besieged his forces in Candahar until, on Sept. 1, he was in turn defeated by Gen. Roberts. For a year thereafter he kept up a rival government at Herat, but was finally driven out by Abdurrahman, and fled to Persia, where he was arrested at the instance of the English, and kept interned at Teheran, the British Government paying \$60,000 a year for his maintenance. The surveillance grew less strict, as Russian influence gained the upper hand in Persia. He has kept himself in communication with the exiles from Afghanistan and the discontented sections of Abdurrahman's subjects. In August, 1887, Ayub made his escape from Teheran. The Shah issued orders for his apprehension to the local officials between the capital and Afghanistan, but he fled in another direction, and arrived in safety within Russian dominions. In October he was heard of in the neighborhood of the Russo-Afghan frontier, and was supposed to be engaged in fomenting a revolt against his cousin in the Herat province and Afghan-Turkistan. Another influential agent for stirring up rebellion in Herat is Iskender Khan, who was appointed governor of Penjdeh in the spring of 1887.

Dhuleep Singh.—The Russians found a new ally, who may be put forward at a convenient juncture as an Indo-Afghan pretender, in the person of the mediatized hereditary Maharajah of Lahore, whose ancient dominions embraced a large part of Afghanistan as well as the entire Punjab. When the Punjab was annexed to British India in 1849, the enormous private treasure of the Maharajah was confiscated. Dhuleep Singh, who was an infant at that time, has several times appealed to the British Government to make restitution of the fortune, but has been told that the allowance of £40,000 a year on which he was induced to live in England was sufficient for the wants of a private individual. He settled on an estate in Norfolk, abandoned the customs and religion of his forefathers, and became thoroughly Anglicized and a popular country squire; but his expenses exceeded his income, and, when he had run deeply in debt, he petitioned to have his allowance increased. The rejection of his suit impelled him to assume a political rôle and become an instrument of Russia in stirring up disaffection among the Sikhs in Northern India. He left England in 1885, for India, but was not permitted to land. Returning to Europe, he was joined in Paris by an Irish revolutionist named Patrick Casey, passed through Berlin under the latter's name, lest English machinations should thwart his purpose, and arrived in June at Moscow, where he took counsel with the editor Katkoff, and was warmly received by the Pan Slavists.

The Frontier Negotiation.—The advance of Russian troops up the Heri Rud to Pul-i-Khatun, and up the Murghab to its junction with the Kushk, defeated the expectation of the English to draw the frontier line of Afghanistan as far north as Sarakhs and Sari Yaz. When, by the battle of Pul-i-Khisti, the possession of Penjdeh passed into the hands of Russia, the contention for an ethnographic frontier was more nearly realized. The interrupted negotiations were resumed after the Ameer had publicly declared that the place was not worth fighting for; and when the Zulfikar difficulty was arranged to the satisfaction of the Russian Cabinet, Sir Peter Lumsden was recalled, and the British boundary commission was divested of its imposing political and military character. Col. Ridgeway and Col. Kuhlberg, the newly-appointed Russian commissioner, proceeded to survey and mark out the frontier on principles that had been settled upon in London. There were differences of opinion regarding the Kaisar pasture-lands in the Maimena district, but no serious disagreement arose until after the commissioners had reached Andkhai. Between there and the Oxus Col. Kuhlberg contended that the line should be drawn to the mound of the saint called Ziarat Khoja Saleh, whereas Sir West Ridgeway claimed for the Ameer all the country south of Kham-i-Ab. The difficulty was referred, as had been arranged for cases of divergence on questions of principle, to the home governments, and, the surveys having been completed, the commissioners returned to Europe in the autumn of 1886. The negotiations were continued in St. Petersburg in the spring and summer of 1887. Sir West Ridgeway, after receiving full instructions from his Government, proceeded thither early in April. The principal negotiator on the Russian side was M. Zinovieff, the head of the Asiatic Department in the Russian Bureau of Foreign Affairs. Col. Kuhlberg and M. Lessar also took part in the conferences on behalf of Russia, while Captains Barrow and De Laessoe assisted Col. Ridgeway. The conferences began on April 23. At the earlier meetings both parties adhered firmly to their claims in respect to Kham-i-Ab. The Russians were the less disposed to give way, because the progress of the Ghilzai rebellion raised doubts as to whether Abdurrahman would remain on the throne to receive the benefit of their concessions. The negotiations were interrupted in May, and the English commissioner, after references to the British Foreign Office, and informal discussions with the Russian representatives, returned to London in the beginning of June, to communicate the Russian views and ascertain the maximum concession that his Government was prepared to make. He returned to St. Petersburg with a proposition to compensate Russia for the relinquishment of her claims to Khoja Saleh and the district on the Oxus, which the Ameer, who had it in

actual possession, insisted on retaining, by ceding a tract of pasture-land that was much desired by the Saryk Turkomans of Penjdeh, situated in the Kushk and Kashan valleys. They formerly possessed this district, but were ousted in 1886, notwithstanding the protest of the Russian commissioner, because the London protocol of June 5, 1885, assigned the territory to the Ameer. The St. Petersburg Government accepted the offered arrangement, and conceded to the Ameer the territory around Khojah Saleh, which, by a strict interpretation of the agreement of 1873, would have fallen to Russia, but which was occupied by Afghan Uzbecks, receiving in return the restoration of lands necessary for the sustenance of the Saryks and the development of the town of Penjdeh. The extent of the land restored to the Turkomans is 825 square miles, bringing the Russians 11½ miles nearer to Herat. The extent of the disputed Kham-i-Ab district is 770 square miles, but it is at present more productive than the lands between the Kushk and the Murghab conceded to Russia. The final protocol was signed at St. Petersburg on July 22, and ratified on August 2. The southern limit of Russian territory on the Oxus is Bosaga. The frontier delimitation extended over three years. The boundary-line, 355 miles in length, was drawn through a wild and previously unknown region. The first portion running from Zulfikar to Maruchak is 120 miles, and the other, reaching to the Oxus, 235 miles. There are no natural boundaries for any part of the distance, yet both Afghans and Turkomans are said to have respected the pillars erected by the British and Russian officers.

ALABAMA. State Government.—The following were the State officers during the year: Governor, Thomas Seay, Democrat; Secretary of State, C. C. Langdon; Treasurer, Frederick H. Smith; Auditor, Malcolm C. Burke; Attorney-General, Thomas N. McClellan; Superintendent of Public Instruction, Solomon Palmer; Railroad Commissioners, H. C. Shorter, W. C. Tunstall, L. W. Lawler; Chief-Justice of the Supreme Court, George W. Stone; Associates, David Clopton, H. M. Somerville.

Legislation.—The Legislature, which met Nov. 9, 1886, concluded its session on the last day of February, 1887, when it expired by limitation. Perhaps its most important act was an amendment to the law regulating the rights and estates of married women, which aims to rescue from almost hopeless entanglement a large part of the property of the State. The old law was characterized by the Governor in his inaugural as "a means of fraud to the wicked and a snare to the unwary. It is the result of the work of different epochs, and is largely patch-work." By the amendment, all property of the wife held by her previous to the marriage, or to which she may become entitled after the marriage, is the separate property of the wife, and is not subject to the liabilities of the husband. The earnings of the wife are her sepa-

rate estate; but the written consent of her husband is necessary to allow her to contract in writing, or to alienate her property. Husband and wife may contract with each other, and the wife with the consent of the husband may carry on business as if sole. Further, the husband is not liable for the debts or engagements of the wife, contracted or entered into after marriage, or for her torts, in the commission of which he does not participate; but the wife is liable for such debts or engagements entered into with the consent of the husband in writing, or for her torts, and is suable therefor as if she were sole.

The former Legislature having provided for the appointment of a commission to codify the State laws, the results of its labors were reported at this session and adopted, and provision was made for publication of the new code.

Provision was made also for the establishment and endowment of Alabama University for colored people, and Montgomery was chosen by the trustees as the site of the new institution. The sum of \$25,000 was also appropriated for a separate institution for the colored insane. A similar sum was voted for a separate asylum for the blind.

For the relief of maimed and disabled Confederate soldiers, \$30,000 was appropriated.

The State was redivided into four chancery divisions (instead of three as before), and the time and place for the sessions of the several chancery courts were fixed.

Another important act was the reduction of the tax-rate from 60 cents on the \$100 to 55 cents, to take effect Oct. 1, 1888, and a further reduction to 50 cents for Oct. 1, 1889. It was estimated that the rapid increase in values in the State would offset this reduction, so that the revenue would not be diminished. Other acts were:

To provide for the sale of the swamp and overflowed lands of this State, and for the sale of the indemnity land scrip issued to this State in lieu of such lands disposed of by the United States.

To prosecute and secure to the State the benefits resulting from all claims of the State of Alabama against the United States for or on account of swamp and overflowed lands, other public land in Alabama sold or otherwise disposed of by the Federal Government, and all other claims the State has under existing laws or may have under laws hereafter enacted.

To prohibit the employment of minors to sell liquors in this State.

To incorporate Lafayette College.

To authorize the Mayor and Aldermen of Birmingham to issue bonds for the funding of the floating debt of the city.

To exempt cotton and other agricultural products in the hands of the producer from taxation.

To authorize street railroads to purchase and condemn property for the purpose of constructing and maintaining and operating street railroads in the same manner as now provided by law for taking private property for railroads and other public uses.

To provide for holding a teachers' institute for a period of not less than one week in each congressional district.

To enable women to hold the office of notary public.

Requiring all insurance companies, whether char-

tered by the State or admitted from other States, to have an actual cash capital fully paid up of not less than \$100,000, and to require such companies to make annual statements to the Auditor.

To require locomotive-engineers to be examined and licensed by a board to be appointed by the Governor.

To prevent the compelling of women and children, or the permitting of children under fourteen years of age, to labor in a mechanical or manufacturing business more than eight hours on any day.

For prevention and suppression of infectious or contagious diseases of horses and other animals.

To incorporate the Alabama State Agricultural Society.

The session was noteworthy for the amount of work accomplished—568 bills and resolutions being passed, or 115 more than at the preceding session. The members were nearly all Democrats.

Finances.—The following table shows the condition of the State treasury at the beginning of the year:

Balance in treasury on Oct. 1, 1886	\$240,811 58
Receipts from Oct. 1, 1886, to Dec. 31, 1886, inclusive	120,867 97
	<hr/>
	\$361,679 55
Disbursements from Oct. 1, 1886, to Dec. 31, 1886	318,286 57
	<hr/>
Balance in treasury at close of business on Dec. 31, 1886	\$143,392 98
	<hr/>
Amount in treasury on Dec. 31, 1884	\$92,682 65
Amount in treasury on Dec. 31, 1885	128,574 90

Of the bonded debt which amounts to \$9,193,900, the greater part is already funded at 4 per cent. interest, but \$954,000 of bonds bearing 6 per cent. interest still remained at the beginning of the year. The Legislature authorized the funding of these at 3½ per cent., a lower rate than the State had before ventured to offer.

Prohibition.—The sale of liquor becomes more restricted with every session of the Legislature. Prohibition is granted, and has been obtained, in the greater part of the State, on petition of the inhabitants of each locality. The Legislature this year added in the same way Butler County and Montgomery, outside the police jurisdiction of the city, to the prohibitory column. It adopted also a local-option law applying to a large part of the State, by which "no license" is likely to be still further extended. At the same time, the license-tax is increasing yearly. In 1884 it was \$50 for retail dealers; the Legislature of that year increased it to \$100; this year it was fixed at from \$125 to \$250, according to the population of the locality.

Confederate Monument.—Strong pressure was brought upon the Legislature to aid in the erection of a monument to the Confederate soldiers of the State, which had already been begun at Montgomery. A bill appropriating \$5,000 for this purpose passed the lower house, but failed in the Senate on a close vote. Private subscriptions have since forwarded the work. Before the close of the year the shaft had been carried up to the height of eighty feet, and only the figures at the top

and at the base were wanting to render the memorial complete.

Miscellaneous.—An improvement in the treatment of the State convicts was made this year by the passage of an act establishing a reformatory system for them, but the practice of hiring them out still leaves much room for improvement, especially in the case of county convicts. Of these the State Inspector says: "They are scattered over the State in such a way as to make it almost impossible to properly inspect them and ascertain their real condition. It seems probable that this state of affairs is going to become worse, as new contracts are being made by many of the counties, and some of these are in exceedingly inaccessible localities."

Early in the year ex-State Treasurer Vincent, who, in 1883, embezzled \$225,000 of the State funds, was brought back, tried, convicted, and sentenced.

The burning of the building occupied by the State Agricultural and Mechanical College, on June 24, caused a loss of \$100,000 to the State, and the destruction of valuable cabinets and apparatus.

Development.—The following statement shows the increase of assessments and taxes on railroads in the State for this year, as compared with last, also the increase of mileage:

Total value for 1887.....	\$37,989,771 26
Total value for 1886.....	23,638,481 01
Increased assessment.....	\$1,251,340 25

The towns and cities of the mineral belt have advanced rapidly, while the agricultural districts remain stationary. In Jefferson County, which contains the city of Birmingham, the valuations were fixed by the assessors for this year at \$30,000,000, an increase of \$17,500,000, or more than 100 per cent. over 1886. The iron industry has grown so rapidly that the pig-iron production of the State has increased from 130,000 tons in 1880 to nearly 400,000 tons in 1887. The production of cotton during this time shows comparatively little change. The movements of the population, and the change at work upon them, are noteworthy. "Already many of the planters of the Black Belt have taken all the money they have heretofore invested in cotton-raising and have invested it in real estate and industries in Birmingham. The chief danger in the impending change is in the fact that the lands are falling into the hands of men who will be inclined to consolidate it in large holdings, and that the poor man will not get a chance for a small farm. All the mineral lands are now owned by corporations, and wherever there is a sign of speculative value land companies have been formed."

ANGLICAN CHURCHES. The "Year-Book" of the Church of England for 1887, being the fifth number of that publication, embodies information furnished by 11,500 of the nearly 14,000 clergymen of the Church. In 80 per cent. of the parishes, 1,182,000 communicants were returned on Easter of 1886. The churches provided 3,000,665 free and 1,000,497 paid sittings. The amount of voluntary offerings during the year was given as £5,000,000: in addition to which, £1,000,000 were raised in the educational department, £16,000 for theological schools, and £10,000 for public schools.

Report of the Ecclesiastical Commissioners.—The report of the Ecclesiastical Commissioners gives the following summary of the work accomplished by the commissioners in the augmentation and endowment of benefices during a period of forty-six years, from 1840 (when the common fund was first created), to the 31st of October, 1886: number of benefices endowed, 5,400; amount of grants made in the augmentation and endowment of these benefices, about £754,000 per annum in perpetuity, or in capital value about £22,624,000. The benefactions by private donors, consisting of stock, cash, land, tithes, and other property, received by or conveyed to the commissioners or to the incumbents of benefices, amount to about £4,620,000, and are equivalent to a permanent increase of the endowments of benefices of about £154,000 per annum. There is, moreover, a sum of about £26,000 per annum contributed by benefactors to meet the commissioners' grants for curates in mining districts. The total increase in the incomes of benefices from the augmentation and endowments made by the commissioners, or through their instrumentality, amounted, therefore, up to the 31st of October, 1886, to about £984,000 per annum, and may be taken to represent the income which would be derived from a capital sum of about £28,024,000.

Convocation of Canterbury.—The Convocation of Canterbury met on Feb. 8. The subject of a union of the two convocations was considered in both houses. The lower house having requested the president (archbishop) "to direct the appointment of a committee to consider and report on the relations subsisting between the convocations of Canterbury and York, with a view to their common action," the archbishop said that it was not desirable that there should be a mere fusion or union of the two convocations. Each should preserve its integrity. A conference of the two bodies would be very serviceable; and in such a case nothing would be gained by the separation of the bishops into one and the presbyters into another conference, but the conference ought to be held in one combined house. A committee was appointed to consider the subject. In response to a request that an effort be made to secure a reduction of the rate of interest on loans by the Queen Anne's Bounty Office, the committee reported its opinion to be that the

loans could not be made at a lower rate than at present without endangering in some degree the absolute safety of the money and the certainty of making the annual payments that were due. Resolutions were adopted by the lower house, asking for such legislation as would make the collection of tithe-rent charges more easy; requesting the bishops to use all their power to prohibit and suppress the preaching by clergymen of the Church of England in dissenting chapels—a practice which was declared not only to be contrary to the principles and laws of the Church, but also to tend rather to hinder than promote the unity of the Christian people; and deprecating the use in the celebration of the holy communion of wine other than the juice of the grape. A canonical amendment was approved which should make the hours during which marriages may be celebrated from eight o'clock in the forenoon till three o'clock in the afternoon, and should contain a provision that, "in case of the marriage of minors, the parents or governors should signify their consent." The house requested that a committee be appointed to consider the working of the Incumbents' Resignation Act, and that the committee on occasional services be reappointed. The Earl of Selborne was re-elected president of the House of Laymen. This house recommended that a summary and inexpensive tribunal be appointed with power to deal with criminous clerks; declared it desirable to repeal or greatly modify all the legislative enactments which prevent a deacon from engaging in secular occupations; suggested that the law relating to tithe-rent charges should be strengthened and amended; and expressed cordial satisfaction at the scheme of the "Church House" "as a means of extending and strengthening the action of the Church."

The houses of convocation met again May 10. The upper house approved a scheme for the enlarged representation of the clergy in convocation, for which the sanction of the crown is to be asked. A committee report was adopted adverse to the "Deacons' (Church of England) Bill," then pending in the House of Commons, as contemplating a departure which it was not expedient to make, from the long-continued practice of the Church. The bill provided for the modification of the acts precluding deacons from following secular occupations so that they need not apply to deacons who may hereafter be ordained after they are thirty years of age. The report declared that the resolution passed by Convocation in 1884 approving the ordination to the office of deacon of men possessing other means of living who are willing to serve the clergy gratuitously—which involved no change in the law—marked the extreme extent to which it was at present advisable to go in the premises. By this resolution, deacons seeking ordination to the priesthood, besides being subject to all the regular examinations, would first have

to devote their whole time for four years to spiritual labor. On the subject of clergymen of the Church of England preaching in the houses of worship of denominations not in communion with it, the Lower House requested the bishops to take such steps as might be in their power to suppress the innovation. The upper house declared on this subject that, in its opinion, "it is contrary to the principles of the Catholic Church as maintained at the English Reformation, that clergymen should take part in the public religious services of those who are not in full communion with the Church of England, and it is desirable that the bishops should use their authority and influence to induce the clergy of their respective dioceses to abstain from the practice. Nevertheless, the house deeply sympathizes with the desire to bring all Christians into sincere communion with each other through a union with the great Head of the Church, and recognizes the fact that there are many ways of maintaining kindly intercourse with non-conformists, which are not open to reasonable objection." On the report of the committee appointed to deal with proposed additions to the Catechism, a form of answer to the question, "What is meant by the Church?" was approved by the lower house, as follows: "I mean the body of which Christ is the head and of which I was made a member by baptism; of this body part is militant here on earth and part at rest in paradise awaiting the resurrection." A modification of the marriage act was recommended for the benefit of seafaring men who are not able to fulfill the conditions of residence required by the existing acts. Concerning the case of the Rev. James Bell Cox, of the diocese of Liverpool, who was suffering imprisonment for contempt of court in not obeying a sentence of suspension for ritualistic practices, the lower house expressed its judgment that "such imprisonment is entirely inappropriate to questions of ritual observances, causes the greatest distress to many devout members of the Church, and ought, in accordance with the resolution of the Royal Commission on Ecclesiastical Courts, to be abolished." The upper house concurred in the action, and requested the archbishop to seek to obtain a conference on the subject between the bishops and archbishops of the two provinces. The House of Laymen declared itself, by resolution, in favor of the abolition of imprisonment of clergymen as a means of enforcing the judgments of ecclesiastical courts.

The convocation met again in July. The resolution of the Convocation of York on the subject of the canons of the hours of marriage was adopted. Various questions were considered concerning the Additional Rubrics Bill, the proposed amendments to the Church Catechism, and the report of the Royal Commission on Ecclesiastical Courts. A joint committee of the three houses was appointed to con-

sider on the Draft Rubrics and Additional Services Bill.

Deputation to the Queen.—A deputation representing the upper and lower houses of the Convocation of Canterbury was received by the Queen at Windsor Castle, March 8, to present an address from the members of the two houses congratulating Her Majesty on her accession to the fiftieth year of her reign. The address, after the words of congratulation, related that during the year that had elapsed since the convocation had last had the privilege of approaching the Throne, ample evidence had been afforded of "the steady progress of the Church of England in her works of duty and love, and a constant strengthening of attachment to her communion. Some measure (though an inadequate one) of that attachment appears in the vast amount of free-will offerings devoted to the work of the Church of England and Wales. There is no part of the country which is not yielding abundant signs of this progress and this devotion. One event there has been in our own history fruitful (as we trust) of good counsels and good works. An elective House of Laymen is invited to deliberate, not as a part of the constitutional convocation, but as a body of advisers at its side. The experience and judgment of many distinguished men thus become readily available for the service of the Church."

The Queen, in her reply, said: "I rejoice with you in observing the substantial progress of the Church of England and the increasing zeal manifested alike by clergy and laity. The willingness of the laity to organize a voluntary representative body to assist with their counsel and advice, when required, the deliberations of the House of Convocation, is much to be commended."

Convocation of York.—The Convocation of York met February 15. The archbishop, in his opening address, spoke concerning a projected fusion of the two convocations, which, he said, should be viewed with regard to its bearings on the question of disestablishment. The establishment of the Church of England as a national church was expressed by a few elements. They were, the power of the Crown to summon convocation, the nomination of bishops, the visitational power of the Crown, appeal from ecclesiastical courts to the Crown, the fact that no change could take place in the doctrine or worship of the Church without the consent of the Crown expressed by Parliament, and the power of modifying the regulations of the Church by means of statutes. There remained for consideration the plan of a delegation of each convocation to meet together to discuss all convocation business. The combined influence of the delegations, and of convocation, would be great, and it was also conceivable that, by the method suggested, convocation might be altered from assemblies for discussion to bodies where serious business would be considered and accomplished.

A discussion took place between the two houses with reference to the procedure in debating the scheme which was thus brought forward. The lower house desired to meet with the upper house in considering the question, then to retire and debate, and vote upon the matter in separate session. The President of the upper house did not feel free to grant this request, and thought it best for each house to proceed with business, the upper house, as usual, sending down information to the lower house as occasion might arise. The proposition for the joint meeting of the two Convocations by delegations, as approved by the upper house, provides that all the members of that house shall be its delegation, while the delegation of the lower house shall consist of the prolocutor and 85 members, chosen by a committee of selection; that the rights and privileges of the delegates of either house shall apply to the meetings of the delegates in like manner as to the sessions of the Houses themselves; that the York delegation shall vote separately, if any four members of either house shall demand it; and that the joint delegations shall have power to discuss any business which may be submitted by the president of either Convocation, and may pass resolutions thereon, provided that such resolutions are to be considered as recommendations only, which the whole Convocation may afterward discuss and adopt, if they shall think fit. The lower house resolved that "it is greatly to be desired that there should be a joint meeting annually of the Convocations of Canterbury and York," and approved of provisions for the nominating of delegates to attend it. The president said, with reference to obtaining a right of access of the Convocation to the Throne, that he had made an effort in that direction some years ago, and had obtained from the Home Office a distinct refusal. A resolution was passed by the lower house in February, 1886, but he did not consider that he should again go to the Crown to receive the same reply, without some new matter in the form of an address of the house, or the like. A suggestion had been made that in this jubilee year a new attempt should be made to obtain a place for presenting their address in person. The lower house passed a declaration in favor of the revival of diocesan synods, and recommended that advantage be taken of this year of jubilee to form a fund for augmenting the stipends of poorer benefices, and the relief of impoverished clergymen.

Church Missionary Society.—The anniversary of the Church Missionary Society was held in London, May 8. Sir John Kennaway presided. The ordinary income of the society had been £207,793, or £8,555 in excess of the ordinary income of the previous year, which was the largest that had then been returned in the history of the society. The total amount of the receipts on all accounts, had been £284,689. Eighteen young men, university graduates,

and four young women, had been accepted for missionary work, and twelve young men were in training. Among the special features of the missionary work mentioned in the report, was the contemplated sending out, in the fall, of a special mission to India, for the purpose of holding services for the native Christians akin to those of the parochial missions at home. The society returns 230 ordained and 58 other European missionaries, 11 ordained Eurasian and 250 ordained native missionaries, 25 Eurasian teachers, 3,789 native helpers and teachers, 42,717 communicants, and 185,878 adherents.

A review of the work of the society during the past fifty years, embodied in the report, showed that during that period more than 900 missionaries had been sent out, 855 native clergymen had been ordained, and 80,000 adult converts, and tens of thousands of their children, had been baptized.

Society for the Propagation of the Gospel.—The annual meeting of the Society for the Propagation of the Gospel in Foreign Parts was held on Feb. 19. The Lord Bishop of Rochester presided. The receipts of the society for the year had been £105,712, of which £86,966 had been for the general fund, and £18,746 for special funds. A further sum of £1,678 had been received for certain invested trust funds. The society employed 595 ordained missionaries, of whom 128 were natives of the countries in which they were laboring, and 1,700 lay agents, the majority of whom were natives, at 461 stations, situated in 75 colonial dioceses. The missions of this society are directed to the Christian subjects of the British colonies as well as to the Mohammedan and heathen subjects of the empire, and nearly half of its income is devoted to missions in India.

The Liberation Society.—The annual meeting of the Society for the Liberation of Religion from the Patronage and Control of the State, was held on May 4. Mr. G. Osborne Morgan, M. P., presided, and in his address urged vigorous agitation of the principle of disestablishment, whether a "practical question" be offered or not, and invited special attention to the movement for disestablishment in Wales. The annual report of the society said that the year had not been a favorable one for its agitation.

The Case of Mr. Bell Cox.—The case of Mr. Bell Cox, to which reference is made in the proceedings of the Convocation of Canterbury, had been before the courts for nearly two years, and originated in a process for ritualism instituted against him by a gentleman not of his parish. At any early stage in the proceedings, a series of monitions had been addressed to him by Lord Penzance, directing him to discontinue the practices complained of. He paid no attention to them, and in June, 1886, an order was issued suspending him from his office for six months. This he likewise disregarded. Then, in August, Lord Penzance declared him contumacious, when a complication arose, based

upon the fact that the order of suspension had been issued, not by Lord Penzance himself, but by his surrogate in York. Mr. Bell Cox therefore applied to the Queen's Bench Division to prohibit the issue of the writ *de contumacio capiendo*, resting upon this informality. The case was decided against him, by both the court of first instance and the court of appeal. In the mean time, however, the order of suspension had run out, and it was no longer possible for him to be contumacious. Nevertheless he was imprisoned. Upon the ground, however, as shown, that the cause of action against him had already expired when the order for his imprisonment actually took effect, an order for his release was issued on the 20th of May, and he was at once discharged.

The Church Congress.—The twenty-seventh Church Congress met at Wolverhampton, October 8, and was opened with a sermon by the Bishop of Durham. The Bishop of Lichfield presided over the sessions, and in his inaugural address reviewed what the twenty years that had elapsed since the Congress had previously met at Wolverhampton had done for the Church, and what lessons they had left behind them. The Education Act, which, it had been feared, would work disastrously to the schools of the Church, had had an opposite effect, in quickening its zeal in behalf of religious education. The Burials Act had not resulted in the prevalence of irregularities, which had been apprehended. The period had been signalized by the meeting of the Lambeth or Pan-Anglican Conference, at which one hundred bishops had assembled from all parts of the world, under the presidency of the Primate of England. Five new bishoprics had been created within the Church of England, "an event without parallel during the last three centuries." Ancient churches, such as those of Assyria, Armenia, and Egypt, were beginning to come into relations with the English Church. The revision of the Holy Scriptures had been begun and completed. The discussion of the relations of the Bible and science, which had gone on unceasingly, was continued, but with changed character and under changing conditions. The time of loud assertion and of angry controversy was passing. Timid minds were still staggered by the discoveries of science, but they were beginning to remember that all truth is of God. The honest doubter was no longer regarded as a criminal, but as an invalid. It was even admitted that there might be a considerable religious element in doubt. The Archbishop of Canterbury followed with an address on the influence of the Church upon society. The first subject for formal discussion was "The Church and History," which was considered under the three heads—"The Evangelization of England," by the Rev. H. Hensley Henson; "The Relations of the English Church with Rome in the Middle Ages," by the Rev. Canon Creighton and the Rev. J. D. C. Cox; and "The Ref-

ormation Settlement," by the Rev. Canon Curteis. On the general topic of "The Adaptation of Spiritual Agencies to Modern Needs," the agency of "Preaching Orders" was treated of by Mr. G. S. S. Vidal; "Itinerating Missions," by the Rev. S. J. W. Sanders; and "Teaching Missions," by the Rev. Canon F. E. Carter. The Bishop of Ossory and Mr. G. O. E. Maline, with voluntary speakers, spoke on "The Priesthood of the Laity; its Responsibilities and Privileges." The subject of "Elasticity of Worship" was introduced in papers by Archdeacon Watkins and the Rev. Prebendary Dumbleton, who were followed by Earl Beauchamp, the Rev. J. E. O. Welldon, and other speakers. The question of "Tithes" was discussed by Mr. P. Vernon Smith, Mr. Jasper Most, M. P., and Prebendary Grier. On the question of "The Use of the Influence and Organization of the Church for the purpose of Alleviating Distress and giving a more Intelligent Direction to the Movements of the Population, and by the Systematic Promotion of Emigration and Colonization," the Rev. Prebendary Billing considered the evil of the migration of people from the rural districts to the large towns; Mr. James Rankin, M. P., spoke on emigration; and the Earl of Meath advocated colonization by the Church; "The Relations of the Church of England to Eastern Churches—the Armenian, Assyrian, Coptic, and Native Indian Churches," were discussed by the Rev. Dr. E. L. Cutts, Mr. Athelstan Riley, the Rev. E. A. B. Owen, and Bishop Blyth, of Jerusalem. Regarding "The Church in Africa," papers were read on "Early Churches," by Prof. G. T. Stokes; "Mohammedanism," by Canon Isaac Taylor; and "Modern Missionary Advances and Hindrances," by Archdeacon Hamilton and Prebendary W. J. Edwards. At evening and other special meetings were considered the subjects of "Hindrances to Religion in Common Life," by the Bishops of Carlisle and others; "The Sunday-School in its Relation to the Church," by Canon Bowley; "The Home Duties and Domestic Relations of Educated Women"; "Child-Life in our Great Cities," by the Bishop of Bedford and other speakers; "Christian Evidences," by Mr. H. T. Davenport, M. P., the Bishop of Manchester, and others; "Socialism and Christianity," by the Bishop of Derry, Mr. H. H. Champion, and Mr. Stanley Leighton, M. P.; and "The Devotional Life of the Church as illustrated by Religious Societies of the Eighteenth Century, by Guilds and Associations for Communicants, for Prayer and Bible Reading, etc., and by Retreats and Quiet Days," by the Rev. W. H. Barlow, the Rev. R. S. Hassard, Prof. Stokes, and other speakers.

ARCHÆOLOGY. (American.) Data for American Prehistoric Chronology.—Dr. Daniel G. Brinton delivered an address as its chairman before the Section of Anthropology of the American Association, on the "Prehistoric Chronology of America." The means at our command, he

said, for reconstructing the history of the peoples who inhabited America during the prehistoric period could be divided into six classes:

First were the legends or traditions of the various tribes. The resemblance which many of them bore to Semitic or Oriental myths must be regarded as coincidences only. In the case of the savage tribes, ignorant of writing, it is probable that the lapse of five generations, or say two centuries, completely obliterates all recollection of historic occurrences. The case is not much better with the semi-civilized nations—the Mayas and Nahuas, or the Quichuas of Peru. The chronicles of Mexico proper contain no fixed date prior to that of the founding of Tenochtitlan, A. D. 1325. When we turn to the monumental data, we find it doubtful whether the edifices of the Pueblo Indians, or any of the great structures of Mexico, Yucatan, and Peru supply prehistoric dates of excessive antiquity. The pueblos of New Mexico and Arizona were constructed by the ancestors of the tribes who still inhabit the region, and at no distant day. There is every reason to suppose that the same is true of all the stone and brick edifices of Mexico and Central America. The majority of them were occupied at the period of the conquest; others were in process of building, and of others the record of their construction was clearly in memory. There were, indeed, some once fine cities fallen to ruins, and sunk into oblivion, such as Palenque and T'Ho, on the site of the present city of Merida. But tradition, and the present condition of the sites, unite in the probability that they do not antedate the conquest more than a few centuries. A more ancient class of monuments are the artificial shell-heaps along the shores of both oceans, and of many rivers of North and South America. They differ widely in antiquity. Those of Maine contain bones of the great auk, which now exists only in the Arctic regions. Of great antiquity, also, are the shell-heaps of Costa Rica, estimated by Dr. Earle Flint to be 20,000 years old, and the Sambaquis of Brazil, which were coeval with a race different from that which occupied the country when it was discovered by the white man. This class of monuments, therefore, supply us with data that prove man's existence in America in the Diluvial, Quaternary, or Pleistocene epoch, which was characterized by extinct species.

Of the third class, or industrial evidences, the oldest shell-heaps hitherto examined in Brazil, Guiana, Costa Rica, and Florida, supply fragments of pottery, of polished stone, and compound implements occur even from the lowest strata; but, venerable though they are, they furnish no date older than what in Europe would be regarded as of the Neolithic period. The arrow-heads found in the lake-beds of Nebraska, and the net-sinkers and celts from the gold-bearing gravels of California, prove by their form and finish that the tribes who fashioned them had already taken long

strides beyond the culture of the earlier Palæolithic age. The only station in America that has furnished an ample line of really and exclusively primitive specimens, is that of the Trenton gravels, in New Jersey. They were of a date much earlier than the extinction of the native American horse and the mastodon. There is nothing unlikely, therefore, in the reported discoveries of man's pointed flints and his bones in place along with the remains of these quadrupeds. There is no *a priori* argument against mastodon mounds and pipes, but their authenticity is merely a question of evidence. The material of which implements are made supplies us data. All of the oldest implements are manufactured from rocks of the locality. When, therefore, we find a weapon of a material not obtainable in the locality, as the obsidian of the Yellowstone Park in Ohio, and the black slate of Vancouver's Island in Delaware, we have a sure indication that it belongs to a period of development considerably later than the earliest. The extension of cultivated plants, as of maize and tobacco—plants of Southern Mexico, which were cultivated from Canada to Patagonia—is also evidence of considerable development.

Another source of evidence is in the consideration of languages, of which there are about eighty stocks in North and one hundred in South America, some of them having scores of dialects spoken over wide areas. Nothing less than a vast antiquity, stretching back tens of thousands of years, can explain this exceeding diversity of languages and their dialects.

More attention has been paid to the physical than to the linguistic data of the native Americans, but with not more satisfactory results. The most accurate examinations of their physical characteristics show that, with a great diversity in details, essentially the same type prevails over the whole of both continents, and Prof. J. Kollmann, of Basle, has concluded, from analysis of the cranioscopic formulas of the most ancient American skulls, that the physical identity of the American race is as extended in time as it is in space; and we may declare that throughout the whole continent, and from its earliest appearance in time, it is and has been one, as distinct in type as any other race, and from its isolation probably the purest in all its racial traits.

The geological evidences are such that no one who examines them will now deny that man lived in both North and South America immediately after the Glacial epoch, and that he was the contemporary of many species now extinct. Some discoveries are said to place the human species in America previous to the appearance of the glaciers; but they have not been of a character to convince the archaeologist. In the light of present knowledge we can not assume any immigration from Africa or Southwestern Europe, or Polynesia; and zoölogists hesitate, from the lack of other types near enough to him in development, to consider man

an autochthon in the New World. From the theories of man's origin at a primal center, which is the one most agreeable to anthropologists, the earliest Americans must have made their advent on this continent as immigrants. But we can not assign the position of the immigration on the scale of geologic time, till we have more complete discoveries.

Work of the Bureau of Ethnology.—The Bureau of Ethnology of the Smithsonian Institution having undertaken an exploration of the mounds in the United States on an extensive scale, has so far made a prominent feature of its plan the search for and study of the various forms and types of the works and minor vestiges of art, and the marking out of the different archaeological districts as disclosed by investigation. Operations have been carried on in Southwestern Wisconsin and the adjoining districts of Minnesota, Iowa, and Illinois, the northeastern part of Missouri, the western part of Southern Illinois, Southeastern Missouri, the eastern part of Arkansas, certain points in Northern and Western Mississippi, the Kanawha valley of West Virginia, East Tennessee, Western North Carolina, Northern Georgia, and a few points in Northern Florida. Some work has also been done in New York, Ohio, Kentucky, West Tennessee, Alabama, and Southwestern Georgia. Hundreds of groups have been examined, and in most cases surveyed, platted, and described. More than 2,000 mounds have been explored, including almost every known type as to form, and not less than 88,000 specimens have been obtained. Some singular and unexpected discoveries have been made of objects in relatively modern styles. Some of these things clearly pertained to intrusive burials, but a large portion of them appear to have been placed in the mounds at the time they were constructed, and in connection with the original interment. From the data so far obtained by the bureau and other workers in the same field, the conclusions are drawn, according to the report of Dr. Cyrus Thomas, that the mound-builders of the area designated consisted of a number of tribes or peoples bearing about the same relations to one another and occupying about the same status in culture as the Indian tribes that inhabited the country when it was first visited by Europeans; that the archaeological districts, as determined by the investigations, conform to a certain extent to the localities of the tribes or groups of cognate Indians at the time of the discovery; and that the theory is not justified by trustworthy discoveries that the builders belonged to a highly-civilized race, or that they were people who had attained a higher status in culture than the Indians. It also appears that each tribe adopted several different methods of burial, at which often some kind of a religious or superstitious ceremony was performed, in which fire played a conspicuous part; but there is no evidence that human sacrifices were offered. The custom of removing the flesh before the final

burial prevailed more or less extensively. The large flat-topped mounds in the southern districts are thought to have been occupied, as a general rule, by the council-houses and the residences of the chiefs and principal personages of the tribes; and it seems to have been a common custom when deaths occurred in dwellings standing on low mounds, to bury in the floors of the dwellings, burn the houses, and heap mounds over them before they were entirely consumed or while the embers were yet smoldering. The links that have been discovered connecting the Indians and mound-builders are held to be numerous and well established. The statements of the early navigators and explorers concerning the habits, customs, circumstances, etc., of the Indians when first visited by Europeans are largely confirmed by what has been discovered in these works. This is declared to be especially true as to Arkansas, Georgia, and other Southern States, where the discoveries made by the assistants of the bureau bear out even to details the statements of the chroniclers of De Soto's expedition and of the early French explorers. The testimony of the mounds is regarded as decidedly against the theory that the mound-builders were Mayas or Mexicans who were afterward driven south, and as equally against Morgan's theory that relates them to the Pueblos of New Mexico. From evidences of contact with European civilization, which have been already referred to, which can not be attributed to intrusive burial, it is believed that a goodly number of the mounds were built subsequently to the discovery of the continent by Europeans.

Funeral Rites of Certain Mound-Builders.—In the explorations in the valley of the Little Miami river, Ohio, by F. W. Putnam, in behalf of the Peabody Museum of American Archæology and Ethnology, two mounds in Brown County bore evidence in their interior of fire having been kept up on the spot for a long time. Marks of post-holes around the ash-beds in both of these mounds showed that structures had been erected over them, and the charcoal contained in the post-holes of one of the mounds indicated that the posts had been burned. Dr. Putnam offers as an interpretation of the history of this mound: "Apparently there was originally here a wooden structure which was burned, and this was followed by a long-continued fire until the immense bed of compact ashes had been formed. On this, in some places, clay had been placed and burned hard. Over this bed of ashes clay mixed with ashes, either from the edges of the bed or from some other fire, had been placed, and over all the thick layer of clay, making a mound of at least 60 feet in diameter by at least 8 in height." For the origin of the mounds and the fires, the explanation is offered that they commemorated ceremonies connected with the dead. In the search among the burial-places near Madisonville, a considerable number of graves were opened which had

been carefully constructed of stones, and in which the skeletons lay at full length on the back. In many of these graves the bones of the hand held spool-shaped ornaments made of hammered copper, which the explorations had proved to be ear-ornaments. Such ornaments had previously been found in various parts of Ohio and west to the Mississippi in Illinois and Tennessee, but not in the stone-graves of the Cumberland valley, or among the graves associated with the ash-pits in the cemeteries of the Little Miami valley, or with the skeletons buried in the stone-mounds or in the simple burial-mounds of Ohio. They seemed to be particularly associated with a people with whom cremation of the dead, while a rite, was not general, and who built the great earthworks of the Miami valley. Cremation and inhumation were everywhere found to have been connected with the mortuary rites of the people whose graves these were.

Decipherment of Mexican Manuscripts.—Mrs. Zelia Nuttall, who is familiar with the Nahuatl language of Mexico, has found, by a translation into that language of the phonetic symbols of the ancient Mexican documents known as the Vienna Codex and the Selden and Bodleian manuscripts, that these entire codices are composed of signs representing parts of speech forming in combination words and sentences, and has discovered determinative signs making the interpretation of the writing certain. She is satisfied that the documents in question are records of lands, tributes, tithes, and taxes; and she is convinced by a partial decipherment of portions of them, that the Borgian, Vatican, and Fejeryary codices do not relate, as has been supposed and maintained, to astrological and exclusively religious matters, but deal with the details of a commercial form of government.

Assyrian and Babylonian Antiquity of the Cuneiform Characters.—Mr. A. H. Sayce has called attention to the fact, as presented by a comparison of the older and the later cuneiform inscriptions of Assyria and Babylonia, which are particularly illustrated in the "Tableau comparé des Écritures Babylonienne et Assyrienne" of Messrs. A. Amiard and L. Méchineau, that "in most instances the oldest form of a character which we know is as widely different from the original picture represented by it, as are the latest forms met with in Babylonian and Assyrian texts. Not only is the character already cuneiform, the primitive curves and connected lines having become angular and broken, but it is generally impossible to tell any longer what is the object intended to be depicted. The hieratic characters of Egypt have departed less widely from their primitive pictorial forms than have the earliest specimens of cuneiform writing with which we are acquainted. And yet the monuments of Telloh (see "Annual Cyclopædia" for 1882), upon which these degenerated hieroglyphs occur, go back to the fourth millennium before our era, and still

preserve reminiscences of the vertical direction in which Chaldean writing, like that of China, originally ran. It is true that in some cases we can trace the lineaments of the primitive hieroglyphs, and thus learn, for instance, that the inventors of the writing were a circumcised race who worshiped the stars, regarded destiny as a flying bird, and symbolized the act of walking by the human leg; but, as a general rule, the almost entire obliteration of the original picture is complete.

Minor Assyrian Documents.—Mr. S. Alden Smith, an American Assyriologist, studying in the British Museum, has made a special work of examining the collection of small tablets on which are recorded the dispatches, letters, and minor documents of the court and camp life of the empire. The nature of the writings is described by the compiler by saying that the perusal of them is "as if some one, 2,500 years hence, studying and deciphering the annals of Great Britain, would find some short letters from Yorkshire, Lancashire, Scotland, Wales, and Ireland, written by the chief of police, or some revenue or tax collector, whose grammar would not be regular, or style faultless." Written in the popular dialects, these tablets teach much regarding the manners and customs of the people, and the composition and etiquette of the court, and give views of various classes of Assyrian society. They are of both private and official character, the official papers being the most numerous. One series of the documents relate to the affairs of Babylonia after its capture by Tiglath-Pileser II, and depict an active agitation in favor of the restoration of Babylonian autonomy, continuing under the leadership of Merodach Baladan II, and those who came after him, during the reign of Tiglath-Pileser II and Sennacherib. The agitation was marked by rebellious disturbances and intrigues, which are clearly revealed, and illustrate how, in ancient as in modern times, apparently trivial circumstances may be the beginning of great political movements. They are also of much interest to the student of Oriental literature and manners, in that they show how many expressions and forms of address still current in the East have come down from extremely ancient times.

Inscriptions from Abu-Hubba.—A private collector in England has obtained a large number of inscribed tablets and cylinders that were collected by Arab antiquity-hunters from the mound of Abu-Hubba, which represents the ancient city of Sippara, after Mr. Rassam had discontinued his work there. The majority of the tablets relate to the collection of the revenues of the temple (the great Temple of the Sun-god), which were derived from tithes and dues on corn and dates, and from contributions from pious donors. In addition to these sources of revenue, large grants of land had been made from time to time by kings and others, and were farmed like the Wakouf estates of the Turkish mosques or the glebe-lands of

the English Church. Thus, in the twelfth century B. C., the king gave to the temple "a farm adjoining the city of Al-Essa (New Town), which is within Babylon, and placed it in charge of Ekur-sum-ibassi, a priest." Similar grants were made by other kings. The collection affords very clear indications of the wealth of the land of Chaldea in the seventh and sixth centuries before the Christian era; such as four thousand sheep given as sheep-dues in one year; ten thousand measures as tithes of corn in the third year of Nabonidus, B. C. 553; in another year, five hundred measures from one man. Receipts are also found for quantities of barley, dates, and other fruits, oils, and honey—all collected from farmers, boatmen, scribes, weavers, the master of the camels, and tax-paying women. The tablets further mention the receipt of various material for the repairs or adornment of the temple; of wood and stone in the eighth year of Nabopalassar, B. C. 616; of wood, furniture, and bricks, in the seventh year of Nebuchadnezzar II, B. C. 547; of straw and reeds for building; of five minæ worth of cedar and cypress-wood in the first year of Cambyse, B. C. 529; and of fifty-four shekels of gold in the reign of Darius. One of the most interesting features of the tablets is the care with which the accounts are kept. The names of the payers are entered in full, and sometimes the name of the father and the trade are given. The amount is entered in ruled columns, with total summed up at the foot, and the whole sometimes countersigned by witnesses. Some of the tablets are of great historical value as connecting links in the chain of documents on which Babylonian and Assyrian chronology are based. Every one of the tablets is dated in the month, day, and regnal year of the king's reign in which the transaction took place, and they are therefore a valuable aid in fixing the chronology of the period. Among the new names is that of Sui-sar-iskun, as one of the claimants to succeed Assurbanipal; a name which, in the abbreviated form of Sariskun, bears a resemblance to the Saracus, given in the list of Berosus as the name of the last king of Assyria. Another tablet is of the tenth year of Kindalanu, the Kinladius of the Canon of Ptolemy, B. C. 687. Among the relics from the most ancient period of the mounds of Tello, M. Berthelot has identified a vase as made of metallic antimony, a substance which was supposed to have been unknown till the fifteenth century.

Cyprus. The Succession of Five Kings.—Importance is attached to a Phœnician inscription on a marble slab, consisting of one hundred and thirty letters in one line, which has been discovered by Herr Richter, near Dali, in Cyprus, because it contains the name of Baalam, the son of Azbaal, the son of Baalmelek; Baalam being known to have been the father of Melikeathon, this name establishes the line of succession of the Phœnician kings of Kition from Baalmelek to Pamiathon (five lives in all; from

about 450 to 800 B. C.). The list in lineal descent is as follows:

Basimelek, B. C. circa	450-490
Azbaal	420-440
Basram	400-380
Melkiathon	380-350
Pamiathon	350-300

The inscription is dated in the third year of the reign of Azbaal, and records the dedication of the monument, with an invocation. It is mutilated in both ends of the line, and shows traces of a short second line, the restitution of which is hopeless.

Egypt. The Sphinx and Neighboring Tombs.—

The work of clearing away the sand from around the Great Sphinx, which was begun under M. Maspero, has been going on intermittently under his successor, M. Grébaut, for several months. At the beginning of 1887, the entire fore-part of the figure had been laid bare, exposing the chest, the paws, the space between the paws, the altar in front of them, and the plateau on which they stand. A space had been cleared between the Sphinx and the edge of the Pyramid plateau, by which the flight of steps forty feet in width, described by Pliny and uncovered by Caviglia in 1817, leading down to the Sphinx, was again exposed to view. A second flight of steps and two Roman buildings, also discovered by Caviglia, are yet to be brought out. A further excavation in the direction of the granite temple to the south, which was in progress, is expected to solve the question whether the Sphinx stood in the midst of a huge amphitheatre hewn out of the solid rock. The whole height of the figure may now be measured from the level of the area below the flight of steps as it rises one hundred feet above. The space between the paws is thirty-five feet long and ten feet wide. It was anciently converted into a small sanctuary lined with votive tablets. One of these—the *stela* of Thothmes IV—still remains *in situ*. It records a dream of the king, in which the even then venerable image exhorted him to clear away the sand in which it was nearly buried. A part of the fourteenth line of this inscription, containing the name of Khafra, or Cephren, has scaled off since the last copy was made. The stone on which it is written appears to have been appropriated by Thothmes from the neighboring Temple of Khafra. The paws of the Sphinx, as they now appear, are a restoration of Roman date, and the facing of the breast, also apparently Roman, has been repaired again. The paws are covered with the Greek *graffiti* of early travelers, which M. Maspero has undertaken to translate. M. Grébaut has worked his excavations to the face of the Libyan cliff bounding the Pyramid plateau on the west, and has discovered several interesting tombs in the neighborhood of the Great Pyramid. In two of the rock-cut tombs in the face of the cliff, the walled-up recesses, or *sordubs*, constructed for the safe-keeping of funerary portrait-statues, were still intact, with their contents. One contained a mono-

lithic group of four figures representing the deceased, his wife, his brother, and a child. An alabaster altar, sculptured in bas-relief, with the likeness of one Ra-ur, was found in another; and on the walls of another tomb occurred the name of Aseska-f, the successor of Menkara (Menkera or Mycerinus), of the fourth dynasty. Another tomb proved to be the sepulchre of a *sutense*, or royal son, named Kuhfu-Kha f (the glory of Kuhfu), who was probably the son of the builder of the Great Pyramid. The doorway of the inner chamber of this tomb is decorated with the earliest representation of a column yet discovered, with base, shaft, torus, and capital complete, the whole showing that, as an architectural feature, the column with all its members was already fully developed at the time of the fourth dynasty.

The Cemeteries of Tell el Yehoodieh.—The excavation of the mound Tell el Yehoodieh (mound of the Jew), twenty-two miles northeast of Cairo, on the Suez Railway, has raised some interesting questions. The mound, on account of its name and of the correspondence of its distance from Memphis with that given by Josephus, was identified by Sir Gardner Wilkinson forty years ago, as probably marking the site of the city of Onia, which, according to Josephus, was founded in the latter half of the second century B. C., by Onias, a Jewish fugitive from the persecutions of Antiochus Epiphanes, King of Syria, and in founding it assumed to be fulfilling the prophecy of Isaiah (xix), that there should be "an altar to the Lord in the midst of the land of Egypt." A magnificent building, richly decorated, had been discovered here in 1870, in which were found a statue of Ramesses II, a statue of Menephtah, his successor, two black basalt statues of the cat-headed goddess Bast, and ovals of Ramesses III. The statues of Bast are in harmony with Josephus's identification of an ancient building at this place with the name of Bast, or Diana, and with the mention in the letter of authorization issued by Ptolemy and Cleopatra to Onias, of "that temple which has fallen down," and which he was permitted to purge, as "named from the country Bubastis." The Tell consisted of two artificial hills, in appearance like the two towers of a pylon, from the top of which could be distinctly traced the plan of what looked like a Roman military settlement, bounded on one side by the desert, and on the other by the cultivated land, very regularly laid out in two large parallel streets. The excavations were conducted by M. Naville and Mr. F. Llewellyn Griffith, who first endeavored to find in the mound some record of the ancient name of the city and temple before the occupation by Onias. Failing in this, they turned their attention to the necropolis, where they found the tombs cut in the rock very close to one another, and all designed on nearly the same plan. Two or three steps led to a small door, which opened on a square chamber, on all sides of which were horizontal niches of the

size of a coffin, sometimes in two rows, one above the other. Nearly all the tombs had been rifled in ancient times. They were regarded as certainly Greek and Roman, and the corpses had not been mummified. Some of the names on the tombs were apparently Hebrew. Such were Nethaneus, Eleazar (ελεαζαρ), Barchias (βαρχιας βαρχιογ), and others which might be Greek or Jewish. Thus, out of a small number of tablets discovered, one half contain names which are decidedly Jewish; and M. Naville "can not help concluding that the tradition which makes Tell el Yehoodieh a Jewish settlement rests on an historic basis." Further in the desert was another necropolis, containing a great number of terra-cotta coffins, generally hidden in brick chambers. They had nearly all been rifled. The coffins had urns placed at the head and feet. They were painted with Egyptian patterns and hieroglyphics in imitation of the Egyptian style, but in designs which appeared to have no other meaning. M. Naville was not able to agree with Brugsch's supposition that the city was the city of Heliopolis, rebuilt after the Hyksos invasion, but came to the conclusion that it was of more recent origin, and did not come into importance till under the Ptolemaic rulers; that the site was probably that of the city given to the Israelites by Ptolemy Philopater. Mr. F. Llewellyn Griffith made more extensive examinations of the further cemetery, from which he qualifiedly ascribed the graves to the period of the Ramesside dynasties. So far as the relics—the statues, the porcelain images of cats and of Bast, porcelain lion-amulets, scarabel, and fragments of pottery of twelfth and thirteenth dynasty types, and a single inscription on a granite altar of Thoth-Upper So-Bast Mer-Amen, a hitherto unknown king, probably of the twenty-second dynasty—throw any light on the history of the old city, it appears to have been as ancient as the time of the thirteenth dynasty; to have been embellished by Ramesses II and Menepthah; to have received additions to the temple under Ramesses III, and to have been still a flourishing city when Bast was worshiped under the Bubastis kings, or in the tenth century B. C. But in the time of Ptolemy Philopater it had long been deserted, and given up, according to Josephus, to the "sacred animals," or cats.

A few miles from this place, at Tukh-el-Karmûs, M. Naville and Mr. Griffith explored a singular group of buildings surrounded by a wall measuring about a mile each way, with a smaller inclosure containing the sites of two temples, of all of which only two foundations could be traced. Rich collections of small objects, including some Phœnician figures, were found in a part of the excavations, with a plaque bearing the prenomen of Philip Aridæus B. C. 323 to 317.

The Great Temple of Bubastis.—The attention of M. Edouard Naville was drawn to Tel Basta, the site of the ancient Bubastis, by the thought

that no remains of the eighteenth dynasty had yet been found in the Delta. It having been reported during the winter that some tombs had been opened at this place, in which scarabs were found bearing the name of Amenhotep III, he visited the place in April, in hopes that he might find other monuments of that king's dynasty, "more conclusive than scarabs." The site is about half a mile from the station of Zagazig, on the railroad between Cairo and Ismailia, but although it marked the position of one of the finest of the ancient Egyptian cities—the Bubastis of the Greeks, the Pi Beseth of the Bible, and the Pi Bast of the Egyptians, the seat of the worship of the goddess Pasht and her sacred animal the cat—it was regarded as a place from which all things of interest had disappeared. M. Naville found that the rumors about the tombs were false; but a few of the scarabs mentioned had been found at the Tell. He, however, decided to sink some pits in the bed of the great central depression which marks the area of the ancient temple. The topography of the depression, surrounded by high banks of rubbish on all sides, corresponds almost exactly with the description given by Herodotus (book ii, chap. cxxviii) of a temple which was looked down upon by the encircling buildings that stood upon the embankments high above it. The results of the excavations were unexpectedly satisfactory, and encouraged an active prosecution of operations as long as the season would permit. The plan of the temple was uncovered in three different parts, to which M. Naville gave the names of the Festive Hall, the Hypostyle Hall, and the Ptolemaic Hall. The general effect was to remind him of the great Temple of Sên. The Festive Hall, a large building without columns, was "peopled by a crowd of statues in red and black granite," all of which bore the name of Ramesses II, but many of which were probably usurped by that king. In this hall were also found a standing statue of a governor of Ethiopia; a limestone group of a priest and priestess of the twenty-sixth dynasty, engraved with an interesting geographical inscription; a small statue with the name of Achoris, of the twenty-ninth dynasty, whose monuments are very rare; and a squatting statue in black granite of a son of Ramesses II, wearing the side-lock of youth, which was evidently usurped from the work of an earlier (the thirteenth) dynasty. The most interesting objects were a large number of sculptured blocks, which once constituted a single tableau, representing a great festival of King Osorkon II, of the twenty-second dynasty. Though they are in confusion, it is possible to gather some outline of the design. It pictured processions of priests bearing standards and offerings; other priests, two and two, carrying shrines and sacred boats, supported by long poles upon their shoulders; frequently repeated representations of Osorkon wearing sometimes the crown of Upper, sometimes of Lower Egypt, generally with the cat-headed goddess

LOTUS COLUMNS, GREAT TEMPLE OF BUBASTIS.

Pasht by his side; sometimes offering incense and libations to various gods, or himself worshiped by the priests; sometimes in company with his queen, Karosma; and religious dances executed by the priests, some of whom make fantastic gestures, while others lie flat on the ground. A fragment of an inscription makes record of a festival which took place every fifty years. The entire hall was constructed of red granite, with the sculptured surfaces unpolished. A stone was found bearing an inscription with the cartouch of Pepi I, of the sixth dynasty, the reputed founder of the Temple of Denderah. The "Hypostyle Hall" contained a colonnade, which is declared to justify the judgment of Herodotus in saying that the Temple of Bubastis was one of the finest in Egypt. It consisted of magnificent monolithic columns in red granite, with capitals in the form of lotus-buds, or palm-leaves, or the head of Hathor, with two long locks. Though they bore the name of Rameses II, or of Osorkon II, they were evidently of an older dynasty, and were attributed to the twelfth dynasty; and a stone was found which bore the name of Usertesen III, of this dynasty. In the western extremity

of the pile, behind the sanctuary, in what M. Naville calls the Ptolemaic Hall, occurs the name of Nekhthorheb, or Nectanebo I, of the thirtieth dynasty, as the author of additions. The history of the temple is thus written by intervals for a period, according to Brugsch's chronology, of about 3,200 years, or from the sixth to the thirtieth dynasty. On this point M. Naville remarks that it is a singular fact that "at Bubastis, as at Tanis, we find traces first of the sixth dynasty, then of the twelfth dynasty, and then occurs a gap which carries us down to the nineteenth dynasty. No name belonging to the eighteenth dynasty has yet appeared, though some may yet be discovered. Scarabs, bearing the name of Amenhotep III, have, it is true, been found from time to time in tombs at Bubastis; but, so long as we fail to discover any trace of the eighteenth dynasty in the ruins of the temple, we are compelled to believe that the Pharaohs of that line ruled only in Upper Egypt, and that the Delta must still have been in the possession of the Hyksos." According to this view, the strength of the foreign element was not finally broken till in the nineteenth dynasty, and Seti I may have

been the first king who once again actually reigned over both Upper and Lower Egypt. The absence of any mention of Shashank or Shishak, the founder of the Bubastic dynasty, who is supposed to have been a native of Bubastis, is remarked upon. The tenor of the evidence afforded by this temple is to indicate that Osorkon II, of whom little has been hitherto known, was the most powerful monarch of the Bubastic line. The condition of ruins indicates that the temple was destroyed by some great convulsion, either an earthquake or a revolution or military assault of extraordinary violence.

Early Christian Cemetery at Alexandria.—An early Christian cemetery has been discovered near Alexandria, on the Ramleh Railway line, between Alexandria and Mustapha Pasha stations, and near the site of the Augustan city and camp of Nicopolis. It is composed of tombs excavated in the rock which underlies the region. In the first tomb discovered, a doorway cut into the solid rock gave entrance to a crypt, surrounded by thirty-eight rock-cut *loculi* measuring about nine feet in length by from four feet to six feet in width, ranged one above another in two and sometimes three tiers. In each recess were found ten skeletons, all apparently skeletons of men, the bones being very large, and the teeth in all sound and white, and firmly fixed in their sockets. Two other excavations were discovered also with *loculi* and interments; and the discoveries make it seem probable that the whole area inclosed by the Roman wall, which is one of the marks of the place, is one vast cemetery. Terra-cotta lamps were found with a few of the skeletons, some impressed with an eight-pointed cross, some with a priestly figure in the attitude of benediction, and some with I. H. S. Over one niche was painted a palm-branch ornament, and other half-obliterated Christian ornaments were here and there painted on the ceilings of the galleries. The only inscription found by Count d'Hulst, who directed the excavations, is too fragmentary for translation.

The Hyksos.—Mr. H. Flinders Petrie exhibited at the meeting of the British Association a collection of casts and photographs of the ethnic types depicted on the Egyptian monuments. Among them were representations of the Hyksos chieftains, or shepherd kings. Dr. Isaac Taylor remarks in the features of these portraits, as he considers them—which are distinguished by “high cheek-bones, and broad, flat, dumpy noses”—evidence that the Hyksos were not Semites, but Mongols or Tartars; and that “the story of the conquest of Egypt by the Hyksos is the story of the conquests of the Huns under Attila, and of the Mogul under Genghis-Khan.” Portraits of Hittite chieftains also indicate to Dr. Taylor that the royal race of that nation “belonged to the Mongolic Hyksos type, somewhat softened by intermarriage, while the race over whom they ruled presents an ethnic type of quite another character.

It would seem,” he adds, “that in their career of conquest, the Mongolic invaders subdued Syria as well as Egypt; and that their dominion, after it had been overthrown in Egypt by the Ramessides, endured yet awhile in Northern Syria.”

The Throne of Queen Hatsue, of the eighteenth dynasty, was placed in view of the public at the exhibition in Manchester. This queen was one of the most famous sovereigns of her dynasty. She was a daughter of Thothmes I, and the queen of Thothmes II, who reigned as his successor for many years. She was distinguished by the erection of some grand buildings, including the great Temple of Dayr-el-Baharee, in Western Thebes, and obelisks at Karnak; and by the expedition which she dispatched to the “Land of Punt,” or the eastern coast of Africa—on the oldest voyage of discovery known in history—which returned laden with precious goods and novelties. The throne is made of a hard and heavy wood, of a rich dark color, resembling rose-wood. The legs are carved in the shape of the legs of a hoofed animal, and each ornamented in front with two royal basiliaks in gold. The arms are made of the same dark wood, are of curious shape, and finished with basiliaks of lighter-colored wood. The seat and back have disappeared, and have had to be restored. The whole was richly plated, trimmed with silver, while the nails by which the parts of the chair were connected, were round-headed, and plated with gold. A part of one of the royal ovals remains; it is nine or ten inches long, is carved on both sides, and contains about one fourth of the field of the cartouch. On it are identified, on one side, the throne-name, “Rammo-ka,” and on the other side the family-name, “Amen Knum-Hatshepsu,” of the queen. The wood of this cartouch, like that of the basiliaks on the arms, is very hard and close-grained, and of a tawny-yellow hue, like box-wood.

The throne, and other objects associated with it, are the property of Mr. Jesse Haworth.

Grecian. The Temple of Jupiter Olympius.—Mr. E. P. Penrose has described to the British Archæological School in Athens his discoveries in the Temple of Jupiter Olympius, where he has been excavating on behalf of the Society of Dilettanti. Various massive foundations were come upon, which were in all probability the work of Pisistratus, together with three distinct beds intended for the pavement of different parts of his temple, which were found at levels varying from about nine feet to eleven feet below the floor of the later *naos*. Some drums, about seven and a half feet in diameter, remain of the columns prepared by Pisistratus. The most important result of the excavations was that of settling the question that the temple was octastyle, instead of being decastyle, as had been generally supposed. The probable position of the statue had been ascertained, and the disposition of the foundations corroborated Mr. Fergusson's view of the hypæthrum and gen-

eral system of lighting connected with this temple, as published in that author's work, "The Parthenon." The foundations had been found of one wall, apparently belonging to even a more ancient structure than that of Pisistratus, which the author called, for convenience, the work of Deucalion, to whom the original foundation of the temple was assigned by a tradition which Pausanias records.

Contemplated Excavations at Delphi.—An arrangement has been made between the Greek and French Governments, by which the latter is conceded the exclusive privilege of excavating at Delphi for five years. The ruins of the city are situated under the modern village of Kastri, and this is to be removed, the Greek Government paying the expense of extinguishing the titles to the property, while the French will bear the cost of the excavations. All objects recovered will remain the property of Greece, while the French will have the exclusive right of reproduction, publication, and multiplication of the objects found for five years after the discovery of each. Two previous experiments in investigating this interesting site were that of Karl Ottfried Müller at the southern wall of the terrace on which the Temple of the Pythian Apollo stood, who found fifty-two inscriptions, and that of the École d'Athènes about twenty years ago, in continuation of Müller's work, the fruits of which are embodied in a considerable volume of Delphic inscriptions that are regarded as of great value for the history of the Amphietyonic League and the city of Delphi.

Ruins at Thasos.—Mr. J. Theodore Bent, excavating in the island of Thasos in behalf of the Hellenic Society and the British Archæological Association, has recovered a number of interesting marbles and about forty inscriptions. The most important relics brought to light were a Roman arch and the theatre. The Roman arch appears to have been erected by the Thasiotes to the honor of the imperial family, and to commemorate the victories over the barbarians. It was fifty-four feet in length, and consisted of three entrances, the central one being twenty feet wide. Of the columns one of the inner ones was intact, and stood nine feet nine inches high, with a scroll-pattern running down one angle. Capitals decorated on two sides only, with floral devices in very high relief, and an egg and tongue pattern below, had adorned these columns. Fragments of six of these capitals were found. Above the capitals appears to have run, both behind the arch and in front, a rich frieze, two feet six inches wide, in blocks of marble from seven to ten feet in length, below which in front ran the inscription in two lines in Greek letters, embodying the legend, "The reverend and great city of Thasos to the greatest and most divine emperor, Marcus Aurelius Antoninus, well deserving of his country, great Britannikos, great Germanikos. The city of Thasos to Julia Domna. The city of Thasos to the God L.

Septimius Severus and to Pertinax." Above the frieze was a projecting cornice, and on the top of this had rested a large statue of a man struggling with a lion, fragments of which were found beneath the *débris* of the arch. In front of the two central columns of the arch stood four pedestals, carrying statues, and with inscriptions, and in front of the columns nearest the city stood a pedestal, the inscription of which told that the statue it bore was erected by the senate "to their mother Phloneibia Sabina, the most worthy arch-priestess of incomparable ancestors, the first and only lady who had ever received equal honors to those who were in the Senate." The statue was found, almost entirely preserved, representing a young and handsome woman gracefully robed. In the same neighborhood were found fragmentary remains of a Doric building of much earlier date, on one stone of which was an inscription to Ceraunian Zeus, with a thunderbolt underneath it. Of the theatre, which was situated about five hundred feet above the level of the town, the lines of the seats, the semicircle of the orchestra, and the colonnade behind the stage erections, alone were visible. The seats were separated from the orchestra by a wall of twenty-seven large marble blocks, on each of which had been inscribed two large letters, the purpose of which is supposed to have been to indicate the number of the seats. Along the top of this wall ran iron railings to protect the seats. Letters, names, and initials were found to have been cut on all the seats.

In the southern part of the island, at a spot called Alki, were found the remains of a town of considerable size, which had been built upon an isthmus, and was joined to the capital of the island by a road built of irregular blocks of marble, parts of which could still be seen intact. Of the many buildings found, the most interesting was a large Temple of Apollo, with part of an archaic statue of the god and votive tablets offered by mariners to various gods. Pedestals of other statues were found, including one of Athena, and also a small altar to Dionysus. While the temple was probably dedicated to Apollo in the first place, it seems to have become in later times the recognized shrine of many gods.

Tomb of a Lady.—In digging a trench in the Great Varda Street, Thessalonica, at a depth of two and a half metres, a marble sarcophagus of the pre-Christian Roman period was discovered, which seems to have contained the body of a lady of rank. Handsome ear-rings, rings, a gold chain, a brooch, and other articles, were found near it. The sarcophagus was covered in every part with fine and well-preserved reliefs.

Contemplated Excavation of Sybaris.—The Italian Government has determined upon the excavation of Sybaris, which was famed in ancient times as one of the most splendid and luxurious cities of Magna Græcia, and has placed the work under the charge of Prof. Viola. Tho

fact that it was suddenly destroyed at the moment of its highest prosperity, B. C. 510, coupled with the soft alluvial character of the deposit, like that of Olympia, with which it is buried, encourages the hope that its treasures may be found in a well-preserved condition.

Spain and France. Ancient Sepulchres of l'Argar and Fuente Alamo.—The MM. Siret, of Brussels, in their books, "*Les Premiers Ages du Metal dans le Sud-est de l'Espagne*," describe some thirty prehistoric stations, furnishing relics of the ages of stone, copper, and bronze of which about twelve thousand objects have been collected. The sepulchres present some very interesting characteristics; among them are ex-

the woman was found a fillet of silver. Upon the bones of the other skeleton lay a flat bronze sword studded with rivets. Beautiful pieces of pottery, which had been made without the aid of the wheel, and footless vases, were deposited in the tomb. In another instance, a silver diadem, somewhat like the one just mentioned, but complete, was found upon the head of the skeleton. It was a simple fillet of metal, with an appendage made of a thin plate of silver, occupying a curious position which suggests that some accident must have happened to disturb it during or after burial. Ear-buckles to a round shape, and beads of bone or stone, completed the list of ornaments found in this tomb.

JAR DISCOVERED AT L'ARGAR, SPAIN.

amples of inhumation in jars and in cists constructed of blocks of stone. The arms, tools, and vessels of the deceased were usually placed with him in the tomb; if a man, his hatchet; if a woman, her poignard and bodkin; and jewelry with both sexes, but most abundantly with the female. The jars containing the dead were deposited in a horizontal position with the mouth closed by a stone. In the jar represented in the figure, which was found at l'Argar, were found near the skull three spiral ear-pendants, two of which are of bronze and three of copper. Pieces of linen cloth were still adhering to them; a ring was upon one of the fingers of the skeleton, and beside it lay a bodkin indicating its sex. At the station of Fuente Alamo, of the same age as l'Argar, the burial-places were made of slabs of stone. One of them was 0.82 metre long, 0.55 m. broad, and 0.50 m. deep, and contained the bodies of a man and a woman. Among the *débris* under the skull of

In another tomb was found a bracelet, weighing 114 grains, made of rolled golden wire.

Roman Necropolis at Carmona.—The existence of a Roman necropolis at Carmona, near Seville, has been known for several years. The site is marked by mounds which have proved to be tumuli of a prehistoric age. Around these mounds the Romans had hewed small chambers out of the rock to serve as family tombs. They are from four to five yards square, and of the height of a man. In the walls are small cavities or niches for the cinerary urns, each of which generally contains, besides the ashes of the dead, a coin, a mirror, a lachrymary, needles, a stylus and tabula, and a signet-ring. The walls are mostly painted in fresco or distemper in the Pompeian style, with representations of birds, dolphins, and wreaths of flowers. Near the entrance of each tomb is the crematorium, an oven, also hewed out of the rock, on the sides of all of which signs of fire

are still visible. The 320 tombs which have so far been discovered are disposed in groups, around the tumuli, near the Roman quarry, and on both sides of the Roman roads. The excavations during the past year have been carried on under the direction of the Spanish Government and the Royal Academies of History and the Fine Arts of Madrid. They have brought to light near the Roman roads, a columbarium and three large triclinia for the funeral banquets, in each of which a deep channel is provided, into which the guests threw the libations. The largest of the triclinia contains three tables with their couches, the one for winter use being in a hall, another in the sun, and the third, for the summer, in the shade. Besides these were found an altar, a tomb with its cinerary urns, a kitchen, a bath, a well, and a sanctuary in which is a stone statue. About three thousand objects of interest were found, and some of considerable value.

Neolithic Polishing-Stones at Nemours.—Several stones, on which the neolithic men polished their implements, have been observed near Nemours, in France. They are a fine-grained sandstone with calcareous cementing material, and are marked by depressions of various shapes and sizes; some, narrow, deep, and pointed at either end, appear to be the grooves in which the hatchet-edges were sharpened; others, broader and nearly hemispherical, were adapted to the polishing of arms broadside. There are about a dozen of these stones at the Gué du Beaumoulin, on the right bank of the Loing river, bearing some fifty grooves and twenty-five cup-shaped depressions, and suggesting that a considerable business was carried on at the place. The site is not more than a metre above the present level of the river, a fact that shows that the waters did not at that time rise much, if any, higher than now. Another polishing-stone, in the wood of Laveau, has eight parallel grooves from 60 to 80 centimetres long, together with several plain or slightly concave places, which have been worn down by the rubbing of the sides of the hatchets. Another polisher, a megalith, near the mouth of the Loing, has but one groove and one cup, but is remarkable for being of the same stone as the larger polisher of Beaumoulin, and evidently came from the same spot. Another stone, called the Devil's Rock, is associated in popular belief with a curious legend of the devil playing at quoits.

Syria and Palestine; Syrian School of Archaeology.—Arrangements have been made for the establishment of a "School of Biblical Archaeology and Philology" in connection with the Syrian Protestant College at Beirut. Its purpose will be to afford students the opportunity of studying the Bible in the country where it was written; to promote the study of all the Semite languages, and to afford facilities for research among the ruins and antique relics of the country. It was intended to open the school in October, 1887.

The Rock-cut Tombs of Sidon.—Some quarrymen working in March, about a mile northeast of Sidon, discovered a shaft, open at the top, about 30 feet square and 85 or 40 feet deep. When this was cleared out, doors were found in each of the perpendicular walls, leading to four chambers, in addition to which other chambers were afterward discovered. The walls of the shaft were perfectly oriented. The whole was excavated out of the white limestone; but the walls separating the chambers from the main shaft were built up. The excavation and examination of the chambers were conducted under the direction of Hamdi Bey, of the Imperial Museum at Constantinople. In the southeast chamber lay a large sarcophagus, with a conically gable-roofed lid, of the same shape with seven sarcophagi which had been previously discovered at different times in the province of Lycia. This sarcophagus was decorated with elaborate and artistic sculptures of two winged sphinxes on the rear pediment; a pair of centaurs at either end, the one pair quarreling over a captured stag, and the other pair pouring jugs of water over each other; on the sides, four-horse chariots driven by Amazons, and a boar-hunt. In the east chamber were two sarcophagi, the principal one of which is in the form of a Greek temple, with a gable-roofed cover. Its sculptures include groups of female mourners on the pediments; a hunting-scene on the panel that skirts the base, in which are portrayed wild boars, panthers, lions, bears, bucks, and hyenas; a representation of the funeral scene on the panels extending along the upper edge of the sides; Doric pilasters at the corners, and Ionic columns around the whole, between which are mourning damsels, eighteen in all, each differing from all the others in pose, features, and expression. The north chamber contained two white-marble sarcophagi in the Egyptian style, of the shape known as anthropoidal sarcophagi, having all the variations in the contour of the human form represented. Two other chambers opened out from this one at a lower level, the northwestern of which contained four sarcophagi, only one of which was sculptured. This bore figures dressed in the Assyrian style, with a funeral scene, in which the deceased, stretched upon a funeral-couch, wears an Assyrian tiara. He is guarded by servants, and watched by his wife, and food and drink are offered to him. The west chamber contained one mummy-cased sarcophagus. The southwest chamber, more remote from the entrance, was larger, richer in contents, and more elaborately arranged than the others. It contained in the hither side three white-marble sarcophagi, of the Greek temple shape, covered with rich cornices, and ornamented with a tracery of yellow-leaved vines upon a purple background. Beyond there was a fourth sarcophagus, which is described as being one of the most remarkable specimens of ancient art yet brought to notice anywhere. It is 3.30 metre long, 1.70

metre wide, and 1·40 metre high, with a cover .80 metre high, and walls nearly .40 metre thick. On one side and end is portrayed a battle between Greeks and Persians, and on the other side and end a chase, in which the recent combatants unite. The Greeks are nude, wearing only a helmet, and carrying a great round grooved shield. The Persians are completely clothed, wearing the head-dress called the mitre, and long trousers. One of the principal Greek characters in the battle wears a head-dress made of a lion's skin, and may have been intended to refer to Alexander the Great. The chase-scene gives a representation of a lion attacking a horse, whose rider has pierced the assailant with his spear. The figures stand out in a bold relief, and the whole is colored in various shades, in which combinations of Tyrian purple prevail. These sarcophagi, all apparently Greek, are supposed to belong to different ages, according to their several styles; but no clew to the dates of any of them was found, unless it be contained in some coins found near the last one that bore the stamp of Alexander Baia, 149 to 144 B.C. Two Phœnician sarcophagi of black marble were also found. One was found in the east chamber, under the sarcophagus of the eighteen female mourners, and contained a skull with long black hair, in good preservation, and the skeleton of a woman with remnants of bandages, articles of ornament, etc. The second was found in a separate shaft, in which at first only two bronze candelabra were discovered. The floor of this chamber was formed of great blocks of stone, below which were two other layers still thicker, and beneath this a monolith of ten cubic metres, covering a pit cut in the solid rock. In this pit lay an anthropoidal sarcophagus, which has been compared with the sarcophagus of Ashmanezzer in the Louvre, from which, however, it presents some striking differences. The carvings consist of a head, a winged globe, a kneeling female figure, two erect Egyptian idols, eleven vertical lines of hieroglyphics, and seven and a half lines of Phœnician letters. The sarcophagus was nearly filled with water, and within it lay the body of a young man, with the flesh, except where it had not been covered with water, still tender and firm, but of a bluish tint, with the internal organs intact. Several translations or paraphrases of the Phœnician inscription on this sarcophagus have been offered, all of which are in substantial agreement. The one given by Baltaji Bey, Director of Antiquities at Smyrna, reads: "I Tabnith, priest of Astarte, and king of Sidon, son of Ashmanezzer, priest of Astarte and king of Sidon, lying in this tomb, say: 'Do not open my tomb, for there is in it no gold, nor silver, nor treasures. He who opens this tomb shall have no prosperity under the sun, and shall not find rest in his own sepulchre.'"

The City of Tiberias.—Herr Schumaker has traced the whole wall of Herod's City of Tiberias, on the Lake of Tiberias. It is three

miles in length, and is in shape an oblong, the long side of which is presented to the lake. At its southwest corner rises a hillock five hundred feet in height, crowned with ruins which were noticed, but not examined, by Col. Kitchener at the time of his survey. The ancient wall of Tiberias ran up, and was connected with a strong wall round this hill. Within the wall are ruins, probably of Herod's palace, certainly of a fort. This is then adjudged to have been the Acropolis of Tiberias, which is now proved to have been in the time of Jesus no mean village, but a considerable city, dominated and guarded by a stronghold situated on an elevation of five hundred feet.

The Hittite (Hamath) Inscription.—Capt. C. R. Conder has published in the book, "Altaic Hieroglyphs and Hittite Inscriptions," the results of his studies of the inscriptions of the class formerly called Hamathite, and at a later period, Hittite inscriptions. These inscriptions had been found at Hamath, Aleppo, Carchemish, and through Asia Minor, and had for many years furnished one of the most interesting questions of Oriental archæology. For a long time their origin was in deep doubt, and it was only after evidence had accumulated from the frequent mentions of them in Egyptian and Assyrian inscriptions that the Hittites were a more important people than had been supposed, that the consensus of a considerable number of Oriental scholars accredited them to that nation. Even then they remained undecipherable, because the language in which they were written was unknown. Capt. Conder claims, or hopes, that he has found a key to the reading of this writing, which he calls the Altaic system, which may be accepted by Orientalists as simple and demonstrable, and to have identified the language as belonging to the family of Ugro-Altaic dialects; and he presents in his book the evidence on which his belief rests. He was led to the special investigation by the detection of resemblances of certain of the characters in the texts with particular characters in the Cypriote syllabary, and by the observation of a connection between certain combinations and Accadian word-roots. The symbols appear to have been originally ideographic—or representing objects; but to have lost their original ideographic meaning, and to have become "representative of certain distinct sounds articulary connected in definite grammatical structure." Capt. Conder's conclusion is, that the characters are connected with the Cypriote characters, and that the vocabulary and grammar of the language are Accadian, or nearly related to it. Upon these bases, he has deciphered and published tentative translations of ten of the principal inscriptions. These he finds to be religious in their character, being mostly invocations. None of them are historical. Paleographers are generally agreed with Capt. Conder in supposing a connection between the Altaic and the Cypriote characters. But his

identification of the language with the Accadian stock, and the correctness of his translations, are questioned.

ARGENTINE REPUBLIC, an independent republic of South America. (For details of area, population, etc., see "Annual Cyclopædia" for 1883.)

Government.—The President is Dr. Juarez Celman, whose term of office will expire on Oct. 12, 1892. The Vice-President is Señor Carlos Pellegrini. The Cabinet was composed of the following ministers: Interior, Dr. Eduardo Wilde; Foreign Affairs, Q. Costa; Finance, Dr. Pacheco; Justice, F. Posse; War and Navy, General Racedo. The Argentine Minister at Washington is Señor Quesada, and the Consul at New York, Señor Adolfo G. Calvo. The American Minister-Resident and Consul-General at Buenos Ayres is Hon. Bayless W. Hanna.

Army and Navy.—The army of the republic, exclusive of the National Guard, according to latest official returns, was 7,824 strong, comprising 3,550 infantry, 2,844 cavalry, and 930 artillery. The National Guard was 347,653 strong.

On March 15 a decree reorganized the infantry, which in future is to be composed of twelve regiments of three battalions, each regiment to have one battalion of troops of the line, and two of National Guards, the battalions to number 250 rank and file in times of peace, and 500 in war-time.

The navy consists of 37 vessels, mounting 72 guns, of a total tonnage of 16,112, with 12,855 indicated horse-power, manned by 1,926 sailors. There are three iron-clads, four gunboats, seven torpedo-boats, three steam transports, four cruisers, and sixteen smaller steam and sailing craft. The Minister of the Navy decreed in March the formation of a squadron of evolutions. The manœuvres lasted from April 20 to April 30 at Punta Lara, whence the squadron went to sea.

Finances.—In May, 1887, the foreign indebtedness of the republic amounted to \$93,892,962, and the home debt to \$53,792,320; total, \$147,675,282. The income in 1886 was \$46,634,000, and the expenditures \$46,615,000.

During the summer of 1887 the Government resolved to convert certain outstanding bonds; these were \$3,582,315 9 per cent. treasury bonds of 1875, \$458,106 of the 1858 foreign loan, and \$874,251 1863 bonds of the home debt. For the treasury bonds the Government gave 5 per cent. foreign bonds with 1 per cent. annually set aside for the sinking fund thereof, receiving the treasury bonds in payment at 108½ per cent. The Government furthermore succeeded in floating among German bankers a 5 per cent gold loan to the amount of \$10,291,000 at 90, to be refunded when due at the rate of 4 marks (96 cents) per dollar. This was the first Argentine loan ever placed in Germany, yet it was subscribed for eight times over.

The Argentine Government also found a market in Europe for the "cédulas," or mort-

gage-bonds of the Banco Nacional Hipotecario, bearing 7 per cent. interest, and guaranteed by the Argentine Republic, \$20,000,000 having been issued thereof under provisions of the law of Sept. 24, 1886, with 1 per cent. per annum drawn for their gradual extinguishment. During the first six months of 1887, the customs' revenue collected at Buenos Ayres produced the following amounts: January, \$2,877,695; February, \$2,584,692; March, \$3,727,911; April, \$3,240,882; May, \$2,890,100; June, \$2,413,309; total, \$17,734,589. Between January 1 and August 3, the amount collected was \$21,059,780, against \$17,042,900 during the corresponding period of 1886.

The suspension of specie payment decreed in 1885, which expired on Jan. 9, 1887, was prolonged for two years. The share capital of the National Bank was increased during the summer of 1887 to \$47,273,400. The vote of November, 1886, approving the budget estimate for 1887, fixed the allowance to members of Congress, both senators and deputies, at \$8,400.

Railroads.—The extension of the railway system has been as rapid as the increase in commerce. In 1884 there were fewer than 2,500 miles in operation; in 1885 there were 4,947; and on Jan. 1, 1887, 6,161 miles constructed at a total cost of \$175,000,000 in gold. The Andine Railroad extends from Buenos Ayres to the boundary-line of Chili, and there has been a hope that the Government of that republic would either build up to it or permit some private corporation to do so. But the recent action of the Congress of Chili indicates that the gap of 140 miles between the two oceans, west of the Cordilleras, would remain. There appears to be a decided opposition in Chili to the construction of this road, on the supposition that it would cause much of the merchandise now shipped around through the Straits of Magellan to enter at the port of Buenos Ayres, and thus rob Valparaiso of its commercial prestige. The Argentine Government has granted a concession to a company to construct another transcontinental line from Bahia Blanca, a port 200 miles south of Buenos Ayres to the port of Talcahuano on the Pacific coast, where are extensive coal-mines. The Argentine Government guarantees a dividend of 6 per cent. on the actual cost of the road for twenty years, and gives a generous grant of the public domain. This road would make a large part of the pampas accessible, and give the Argentines a chance at the fuel-deposits of Chili. At present all the coal used in the Argentine Republic, or by ships entering the harbor, has either to be brought around through the Straits of Magellan or from Europe. But it is apprehended that the Government of Chili will refuse to concur in the concession, even to the extent of refusing permission for the construction of the road, for the same reason that it objects to the other transcontinental line. The Argentine Congress, during its last session in 1886, passed a bill ordering surveys for the

Following projected railroads: Extension of Northern Central *via* Jujuy, between the *veza* del Buey, Santa Rosa, and the southern extremity of the Lerma valley, through Salta; Chumbicha to Tinogasta, Fuerte de Anala, *via* Punta del Negro or Quebrada de la; from Mendoza to San Rafael, *via* San Juan, Tupungato, and San Carlos; San Juan to Jachal, and from Albardon *neete*; from Cajamarca to the Northern Junction *via* the Totoral; and finally, Rioja to Santa Rosa or Cholo. Concession applied for for the construction of a d from the Paraná river at a point opposite the city of Corrientes to Tartagal on the frontier *via* Oran, the Government to ee 5 per cent. interest and make the y a land-grant of 360 square leagues in ing lots, with a two-league frontage on es of the line.

il the railroad company that is build- ulla Maria-Rosino (Pacific) Railway ap- the Government for authority to ex- Bahia Blanca, the southern port of mise. Another important project is at is to connect by rail Buenos Ayres evideo. From Buenos Ayres, Las ould be reached over the Northern ilroad. The total cost of this line l at \$12,500,000 in gold. One third n Argentine territory, and the re- Uruguayan.

er Lines.—Under the auspices of e Government two new lines of ips for European traffic are to be and the projects were submitted in July. One is to ply between ; and Bordeaux, carrying the mails vernment guaranteeing the 5 per for a term of twenty years, and annual net profit of the company r cent., such surplus to accrue ment till it shall have recouped nterest disbursements. Another s to be called "La Argentina," of eight first-class steamships carrying the Argentine flag. are to be furnished with re- bers for the conveyance of o carry immigrants from Ligu- mbardy, the Romagna, Tyrol, . The Government to have a suitable compensation to ; transports in time of war. receive a suitable bonus for brings into the country be- y.

lines in operation in 1886 erated as follows:

MILEAGE IN KILOMETRES.			Offices.	Em- ployes.
Lines.	Wires.	Cables.		
177	29,634	72	428	1,263
655	9,423	68	197	271
392	39,057	185	626	1,564

There were in course of construction 800 kilo- metres of state lines. At the close of the year 1886 a consolidation of telephone companies took place at Buenos Ayres, and the new company immediately raised its rates so much that a good many subscribers withdrew, and a movement was set on foot to establish a co- operative telephone company in opposition.

Commerce.—The foreign trade of the Argen- tine Republic for five years has been:

YEARS.	Imports.	Exports.
1882.....	\$61,346,000	\$60,882,000
1883.....	80,485,000	60,207,000
1884.....	94,056,000	68,029,000
1885.....	92,231,000	88,579,000
1886.....	94,870,000	69,590,000

The Argentine foreign trade was distributed in 1885 as follows (in thousands of dollars):

COUNTRIES.	Imports.	Exports.
England.....	85,875	11,927
France.....	14,545	24,165
Belgium.....	7,468	14,886
Germany.....	7,368	5,013
Italy.....	4,207	2,448
Spain.....	3,189	2,243
Holland.....	645	67
United States.....	7,007	5,564
Brazil.....	2,207	2,170
Uruguay.....	4,343	3,868
Chile.....	46	2,494
Paraguay.....	1,471	160
West Indies.....	78	1,438
Other countries.....	4,584	5,146
Total.....	92,231	88,579

The goods shipped were: Wool, tons, 128,398; hides, number, 2,742,771; sheep-skins, tons, 81,337; horse-hides, number, 873,865; other skins, value, \$1,986,000; tallow, tons, 23,260; horse-hair, tons, 2,009; jerked beef, tons, 82,056; cattle, head, 159,664; minerals, value, \$1,682,000; bones, tons, 85,424; linseed, tons, 69,426; wheat, tons, 78,493; Indian corn, tons, 197,860; horns, tons, 1,261; ostrich-feathers, kilograms, 34,710. During the wool-clip of 1886-'87 the export from Buenos Ayres from Oct. 1, 1886, to July 31, 1887, was 226,614 bales, against 262,116 the previous season. During the first quarter of 1887 the import into the Argentine Republic amounted to \$30,322,467, including \$2,765,716 specie, against, respectively, \$30,642,681 and \$6,455,495 during the corresponding period of 1886. The export reached \$27,580,500, inclusive of \$1,000,327 specie, as compared with, respectively, \$36,124,753, and \$5,133,371 the previous year. The American trade with the Argentine Republic is shown in the following table:

CALENDAR YEAR.	Imports into the United States.	Domestic exports to the Argentine Republic.
1886.....	\$4,854,880	\$5,020,825
1885.....	4,775,618	3,984,190

Education.—In 1886 there were 2,415 schools, 1,804 of them being primary public schools, and 611 private; 180,768 pupils were attending them, and the number of teachers was

5,348, the increase since 1885 being 63 public schools, with 12,890 pupils and 612 teachers. The national territorial educational establishments had an increase of pupils, in 1886, of 262, as compared with the previous year. The national capital counts 54 educational establishments, 40 of which, ready to receive 22,000 children, were opened on Oct. 3, 1886. During the year \$3,500,000 were spent on the schools, which is an average of about \$1 to each inhabitant of the country.

Immigration.—The number of immigrants landed at Buenos Ayres in 1886 was 98,116, and 19,298 cabin-passengers; total, 112,409. During the thirty years from 1857 to 1886, 1,098,220 immigrants arrived. During the past seventeen years, 1870 to 1886, there landed from Europe 605,538 immigrants, and from Montevideo 328,003. It has been decided to build eleven hotels for the reception of newcomers, each to have a capacity for boarding and lodging from 500 to 1,000 individuals; one to be located in the suburbs of Buenos Ayres; two in the province of Buenos Ayres; and two in each of the provinces of Córdoba, Santa Fé, Entre-Ríos, and Corrientes. The Argentine immigration law secures the newcomer, during the first days after landing, board and lodging. But the Bureau of Labor immediately busies itself about procuring them work on the spot, dispatching them to a colony, on the Government, if able to utilize their labor anywhere, causes them to be conveyed thither at its own expense. In the new colonies the Government makes the first twenty-five families a land-grant of thirty hectares each. More land is at the disposal of such families at \$2 per hectare, and advances up to \$1,000 are made to each family, if desired, in the shape of provisions, seed for the first crop, animals, tools, and agricultural implements. The liberal credit of ten years is allowed settlers on such land purchases and advances, within which to refund the Government, but a title is given them after two years of cultivation.

New Industries.—The Argentine Congress passed a bill in 1886 incorporating the sugar-refinery to be founded by Messrs. Ernest Tornquist & Co., at Rosario, and guaranteeing for the term of fifteen years 7 per cent. per annum interest on the actual capital to be invested therein, the refinery to work none but domestic cane-sugar, the capacity of the refinery to be at the least 15,000 tons annually of refined sugar. All machinery and material to be admitted duty free, and the refinery to enjoy immunity from any kind of taxation. The new refinery is expected to be in full operation within two years. The production of cane-sugar in the republic has reached 40,000 tons per annum. The Provincial Government of Buenos Ayres in April sold to Lorenzo Pascual Cortada a large plot of land, at the low price of thirty centimes the square yard, on which he is to erect a factory for the weaving of wool, silk, linen, and cotton, at a cost of

\$500,000, the factory to be finished within twelve months. The exportation to Europe of carcasses of sheep, on board refrigerator steamers, has become an important item of trade. In 1883, 17,160 carcasses were shipped; in 1884, 108,800; in 1885, 190,800; and in 1886, 361,200. A company was formed at Buenos Ayres in the summer, with a capital of \$2,000,000, incorporated for a term of thirty years, for the purpose of exporting live cattle, chiefly to Europe. Another company was in the course of formation, with a capital of \$2,000,000, having for its object the export of frozen meat. It proposes to acquire from three to four leagues of grazing-land of superior quality, seed 1,500 cuadras, thereof with clover, and buy cattle enough to have at all times a ready supply of 20,000 head for slaughtering. A similar stock of sheep is to be kept, and the slaughtering is to take place not far from the harbor of Buenos Ayres, so as to facilitate the rapid transfer of meat to be shipped to the refrigerator steamers. A project is on foot in the province of Córdoba, to create an experimental viticultural station, combined with a model establishment for wine-making, under the superintendence of practical viticulturists, who engage to superintend the building of cellars and to furnish all that is necessary for the manufacture of wine in accordance with the most approved modern Bordelais style, the station to be called the Château Córdoba. The province makes them a land-grant covering an area of fifty hectares, thirty-four of which are to be planted with vines; eight hectares are to be set aside for the instruction of apprentices intending to become viticulturists. The Provincial Government will, at its own expense, erect the school-buildings adjoining the station.

Coal and Oil.—Under an offer of a prize of \$25,000, scientific men have been scouring the country for deposits of coal, and are said to have found large beds in the northern part of the republic. The Department of Public Works, which has had the direction of the explorations, is so well satisfied with the genuineness of the discovery that the prize has been awarded, and operations to develop the mine have been begun.

Petroleum.—Petroleum-wells have been discovered thirty-two miles from Mendoza in the Cachenta mountain district.

ARIZONA. Territorial Government.—The following were the officers of the Territory during the year: Governor, C. Meyer Zulick; Secretary, James A. Bayard; Treasurer, C. B. Foster; Auditor, John J. Hawkins; Superintendent of Public Instruction, Charles M. Strauss; Commissioner of Immigration, Cameron H. King. Chief-Justice of Supreme Court, James H. Wright; Associate Justices, William W. Porter, William H. Barnes.

Legislation.—The fourteenth Territorial Legislature convened January 10, and was in session till March 11. One of its first acts was to create a code commission to collate and perfect

the Territorial laws, and much of the time of a session was given to changing or enlarging a fundamental law, as the following captions acts will indicate: Trial of title to real property. Concerning juries and jurors. Forcible entry and detainer. Trial of right of personal property in certain cases. Abolishing distinction between sealed and unsealed judgments. Attachments and garnishments. Concerning frauds and fraudulent conveyances. Concerning bills, notes, and other writings. Concerning registration. Receivers and their duties. Concerning husband and wife. Concerning executions. Concerning partnerships. Concerning evidence. Limits of actions. Concerning wills, descent, distribution of real property. Concerning bonds and sureties. Concerning home-owners. Concerning judgments and liens. A penal code and a code of civil procedure also adopted.

A license law passed at this session repeals laws for general merchandising, and immoderate tax on saloons. Persons holding wholesale liquor license are forbidden to sell the same license. The retail tax was \$200 a year. The following are cap- other acts:

g telegraph tax law.
and distribution of public moneys.
arantine.
do funds for carrying out the provisions of protect domestic animals.
d brands.
own-sites.
county indebtedness.
ge the destruction of wild animals.
ing election laws.
over to the Governor to veto sections in ion bill.
prison and county jails.
mines.
injuries resulting in death.
unding act.

ature was composed of twenty-five eleven Republicans, both houses ratic.

—From the report of the Super- public Schools, made at the begin- ing, it appears that there was an enrolment and average attend- e preceding year. Twelve school created, making a total of 130, additional school-houses were ere maintained in the Terri- ar and 125 primary schools. t open on an average only 124 year. The Normal School at opa County, has been in oper- year, and a Territorial Univer- Pima County, is in process of

with.—According to the report for 1887, there has been a the population of the Terri- 10,440 in 1880, and may now 000. The aggregate assessed

valuation for 1887 is \$26,818,500, which shows an increase in one year of nearly \$6,000,000, notwithstanding the fact that by the present system of assessment and taxation much of the real and personal property is undervalued, and a large portion of the personal property is not listed for taxation. The last legislative assembly created a Territorial Board of Equalization with power to revise the assessments of the different counties.

There are 1,050.04 miles of railroad in the Territory. Two trunk lines, the Southern Pacific and the Atlantic and Pacific, traverse the Territory from east to west, the former representing 888 miles and the latter 392 miles. During the past year 187.8 miles of the new road have been built—the Maricopa and Phoenix, connecting Phoenix, the county seat of Maricopa County, viz Tempe, with the Southern Pacific road, at or near Maricopa station, 84.5; the Prescott and Arizona Central, connecting Prescott, the capital of the Territory, with Prescott Junction, on the Atlantic and Pacific road, 78.8 miles, and 80 miles of the Mineral Belt road.

The United States Land Office certifies that there are 2,000,000 acres of arable land in the valleys of the Colorado, Salt, and Gila rivers. Irrigation alone is needed to reclaim these tracts, and a beginning has been made in the construction of canals. There are now about 400 miles of these canals in Arizona, representing a cost of over \$1,000,000, and reclaiming about 215,000 acres. Most of the stock in these is owned by the holders of the lands under them. The farmer pays for the number of inches he uses to produce his crop, the amount used varying from three eighths to one half an inch per acre.

The product of Arizona in precious metals for 1886 was \$6,108,378. It would be safe to add at least 20 per cent. for chlorides and ores shipped for treatment in Colorado and San Francisco, which are constantly being transported and not reported.

The Mogollon forest, near the center of the Territory, is nearly 200 miles in length, and its average width is about 50 miles, making 10,000 square miles, or 6,400,000 acres. Outside of the pineries of Michigan, Wisconsin, and Washington Territory, there are few portions of the republic that contain such an extensive body of timber. The Arizona Lumber Company, at Flagstaff, sawed in the past year 5,976,493 feet, and shipped 8,305,098 feet of lumber.

Indians.—The principal tribes of Indians in Arizona are the Apaches, the Pimas and Maricopas, the Papagos, the Yumas, the Mohaves, the Moquis, the Navajos, and the Hualapais. The Navajos are most prosperous, intelligent, and enterprising, and doubtless the wealthiest tribe in the United States. They number 15,000 and are increasing. It is estimated that the tribe owns at least 20,000 horses and 1,000,000 sheep. They occupy the Navajo reservation, in the extreme northeast corner of

the Territory, which also takes in a portion of New Mexico and covers about 5,000 square miles. All the other tribes, except the Apaches, are peaceable, and chiefly engaged in agriculture. The latter are lazy, murderous, thievish, and seemingly incapable of civilization.

ARKANSAS. State Government.—The following were the State officers during the year: Governor, Simon P. Hughes, Democrat; Secretary of State, Elias B. Moore; Treasurer, William E. Woodruff; Auditor, William R. Miller; Attorney-General, Daniel W. Jones; State Land Commissioner, Paul M. Cobbs; Superintendent of Public Instruction, Wood E. Thompson; Chief Justice of the Supreme Court, Sterling R. Cockrill; Associate Justices, W. W. Smith, B. B. Battle.

Railroads.—The Legislature, which was in session from January 10 till March 31, devoted much attention to railroad problems, and passed several acts restricting the power of railroad corporations, and protecting the public from possible injustice at their hands. After the rejection of a measure that involved the creation of a special State railroad commission, a bill known as the Smith railroad bill, was adopted. The leading provisions of this are:

That no railroad shall consolidate with, or lease or purchase, or in any way control, any other railroad owning or having under its control a parallel or competing line, nor shall any officer of such railroad act as an officer of any other railroad owning or having control of a parallel or competing line; that no discrimination in charges or facilities for transportation shall be made between transportation companies and individuals, or in favor of either by abatement, drawback, or otherwise, and no railroad shall make any preferences in furnishing cars of motive power; that it shall be unlawful for any railroad in this State to enter into any combination with any other parallel or competing line of railroad for pooling of freight, by dividing between them the gross or net earnings of such railroads, or by dividing the property or passengers carried by said railroads; that all railroad corporations in this State shall keep posted up at every depot freight-office under the control of any such railroad corporation printed schedules showing the rates of fare, and the kinds and classes of property carried.

Another act regulates the rate of charge per mile for the carriage of passengers. Still another prohibits any State officer, whether executive, legislative, or judicial, from accepting a free pass on any railroad in the State, or any railroad from issuing such. A fourth provides that no foreign corporation shall be permitted to lease, build, maintain, or operate any railroad within the State. Doubts were raised regarding the constitutionality of this last act, on the ground that it did not accord to citizens of another State the privileges and immunities of citizens of Arkansas; but the Attorney-General has interpreted it to mean, in accordance with the probable purpose of the Legislature in passing it, but scarcely in harmony with its letter, that all railroad corporations owning property in the State shall *ipso facto* be considered citizens of the State, amenable to its laws, and subject to its taxes. The measure was framed to prevent any further claims by certain large

railroads whose lines ran into the State, that they could not be legally taxed as its citizens.

In 1884 the property of all the railroads in the State, other than lands not connected with the roads, was valued at \$6,352,985; in 1885 at \$9,612,778; in 1886, at \$18,704,688; and in 1887, at \$15,323,472.

State Debt.—The Governor in his annual message says:

The bonded debt of the State amounts to \$5,108,563, including interest to the first day of October, 1886. Of this \$22,000 are State bank bonds, and bear 5 per cent. interest; \$2,067,000 are real-estate bank bonds, bearing 6 per cent. interest; \$1,000 are a Loughborough bond, bearing 6 per cent., and \$100 are a Brooks-Baxter war-bond bearing 10 per cent. interest; but upon the two last named interest has ceased to run. Of the whole amount of the State debt \$2,080,100 are principal, and \$3,028,463 accrued interest.

For meeting this long-standing debt the following measure was passed by the Legislature:

First, it was provided that in order to create a "sinking fund" with which to liquidate the valid and undisputed bonded indebtedness of the State, there shall be levied and collected, and paid into the treasury annually a tax of one mill on the dollar on all taxable property, to be denominated "sinking-fund" tax; second, a State-debt board, consisting of the Governor, Secretary of State, and Auditor, was created to superintend the debt settlement. This board was authorized whenever there should be in the treasury, to the credit of the sinking fund, the sum of \$25,000 or more, to advertise for proposals for the sale to the State of any of the State bonds with accrued interest, and to accept any such proposals at its discretion, and to pay the amount so agreed upon to the bondholders on surrender of the bonds. For this purpose of purchasing bonds during the two years next ensuing, the sum of \$800,000 was appropriated out of the sinking fund. Provision was also made to enable holders of bonds to exchange them for certificates of indebtedness receivable for certain taxes. Under this act bids were made and accepted in July for the sale of bonds at prices ranging from 71½ to 72 cents on the dollar.

Legislation.—Among the acts passed by the Legislature were the following:

To provide for the reorganization of the Arkansas Industrial University.

To abolish public executions.

To regulate the practice of dentistry.

To provide for allowance for widows and children out of estate of deceased persons.

To provide for the collection of overdue taxes from corporations doing business in this State.

To fix the time for holding elections in cities of the second class.

To give effect to the constitutional provision against usury.

To prevent minors from playing cards or pool in dram-shops or other public places.

Fixing the price of State lands at \$1.25 an acre.

To authorize the several counties of the State to issue bonds in lieu of their indebtedness existing prior to 1874.

To make appropriations for the support and maintenance of the Branch Normal College at Pine Bluff.

To limit the time of bringing suits on mortgages.

To provide for the assessment and collection of a public highway tax from corporations, companies, and individuals running sleeping-cars over railroads in this State, and for other purposes. The rate fixed is \$3 per mile for each car per annum.

To submit to the people of the State the question of holding a convention to frame a new constitution.

To encourage sheep-raising by providing against the ravages of dogs.

To provide for the donation of forfeited lands. To compel railroad companies to build and maintain depots, and to stop their trains within certain limits of cities and incorporated towns.

To amend the law relative to Sabbath-breaking, allowing "Seventh-day Adventists," and other sects observing as the Sabbath another day than Sunday to labor, but not to keep open shop on that day.

To protect employes and other persons against railroad companies giving such employes a lien for services and material furnished.

There were 78 Democrats in the lower house, 14 Republicans, 4 members of a semi-political organization, known as the Agricultural Wheel, 1 Independent, and 1 Greenbacker; the Senate was composed of 29 Democrats and 2 Republicans.

Education.—For the year ending June 30, 1885, \$1,199,005.82 were received from all sources for school purposes, and of this sum \$729,168.81 were expended in maintaining the free schools of the State. For the year ending June 30, 1886, \$1,827,710 were received, and \$866,892.45 paid out for school purposes. A large number of school-houses have been built in the State within the past two years, and many of them cost from \$3,000 to \$20,000 each.

Finance.—The annual expenses of the State government, including charitable institutions, are about \$800,000, this being about one third of the total amount raised by State taxation. In 1887 the sum of \$315,408 was apportioned from the State treasury among the counties for the use of the common schools. As the whole school population numbers 358,000 the amount per capita would be \$0.88. A poll-tax of \$1 is also applied to school purposes, besides the tax of about 5 mills levied by each school district for its own purposes of education.

In the case of the State ex-State Treasurer Churchill, the Supreme Court on appeal sustained the decision of Chancellor Carroll rendered at the beginning of last year, by which the sureties of the treasurer's first and third bonds were discharged, but found their liability on the second bond to be \$26,000 instead of \$3,000, and the entire liability of Churchill to the State was adjudged to be \$115,000. As the expenses of litigation will equal the amount of judgment rendered against the sureties, the State will practically lose the whole sum originally misapplied.

ASSOCIATIONS FOR THE ADVANCEMENT OF SCIENCE. American.—The thirty-sixth annual meeting of the American Association for the Advancement of Science was held in the buildings of Columbia College, New York, beginning Aug. 10, and adjourning Aug. 16, 1887. The following were the officers of the meeting: President, Samuel P. Langley, of Washington. Vice-Presidents: Section A, Mathematics and Astronomy, John R. Eastman, U. S. Navy, elected in place of Prof. William Ferrel, of Washington, who was unable to be present. Section B, Physics, William B. Anthony, of Ithaca, N. Y. Section C, Chemistry, Albert B. Prescott, of Ann Arbor, Mich. Section D, Mechanical Science, Eckley B. Coxe, of Drifton,

Pa. Section E, Geology and Geography, Grove K. Gilbert, of Washington, D. C. Section F, Biology, William G. Farlow, of Cambridge, Mass. Section H, Anthropology, Daniel G. Brinton, of Media, Pa. Section I, Economic Science and Statistics, Henry E. Alvord, of Amherst, Mass. Permanent Secretary, Frederick W. Putnam, of Salem, Mass. General Secretary, W. H. Pettee, Ann Arbor, Mich. Assistant General Secretary, J. C. Arthur, Geneva, N. Y. Treasurer, William Lilly, of Mauch Chunk, Pa. The meeting derived additional importance from the fact that it was held in the metropolis. The Buffalo meeting of 1886 had been attended by a comparatively small number, and it was felt that something should be done to increase the attendance. The selection of New York had the desired effect, and 711 members registered as being present. The high character of the officers of the meeting guaranteed an important series of papers, and this promise was well carried out.

Opening Proceedings.—On August 9, the Standing Committee met for the transaction of routine business, and during its sessions three hundred and fifteen new members were elected, including many well-known names.

The meeting formally opened on Wednesday, August 10, at 10 A. M. The meeting in general session in Library Hall organized, and was called to order by the retiring president, Prof. Edward S. Morse, of Salem. The public had been invited to attend the meeting, and had responded so that the large room was crowded with auditors. On the stage with Prof. Morse sat President F. A. P. Barnard, of Columbia College; Prof. Langley, the new president of the Association; Prof. Pettee, the general secretary; and Bishop Potter. Pres. Barnard addressed the meeting, reviewing the list of distinguished deceased members of the Association who had done good work in the scientific field. Bache, Henry, Agassiz, Torrey, Pierce, Mitchell, Hare, and other illustrious names were cited. He ended his address by welcoming the Association as representative of the trustees of the college.

Prof. Langley gave a short address in reply. In it he described the mission of the society, and while saying that too much indulgence should not be exercised in admitting every one to membership and a hearing, yet pleaded for liberality in these regards. Truth sometimes comes to us in an unfamiliar dress, and a large tolerance of errors of speculation should be indulged in, where accompanied by a faithful original study of facts. As a short exposition of the true scope of the society the address was as timely as eloquent, and it met with much appreciation.

The members then left the Library Hall, and at half-past two assembled in the different section-rooms to hear the addresses of the vice-presidents of the sections.

Vice-Presidents' Addresses.—Owing to the change of vice-president there was no address

in Section A. In Section B, devoted to physics, the address was delivered by Prof. William A. Anthony on "The Importance to the Advance of Physical Science of the Teaching of Physics in the Public Schools." The title indicates the general tendency of the address. The utilitarian tendency of modern thought was deprecated, the plea being made that science pursued from purely scientific motives was sure to lead eventually to remunerative results. The fact was also referred to that many of the foremost scientific workers have not given freely of all their work to the scientific world. He proposed that science should be studied in the primary departments, beginning when children are but ten or twelve years old. The object of this teaching would be to graduate from the schools an army of workers fitted to carry on in some shape original investigation.

In Section C, devoted to chemistry, the address was delivered by Prof. Albert B. Prescott, on "The Chemistry of Nitrogen as disclosed in the Constitution of the Alkaloids." Much of the address was strictly technical, hardly admitting of an abstract. The abundance of nitrogen in the free state, its comparative rarity in the combined, settling in its combinations the value of supplies for the nourishment of life, and its paradoxical character in the two-fold rôle thus outlined was developed. After a lengthy consideration of its position in the chemical scale, the structure of the chief alkaloids of plants was considered, and the progress of alkaloidal synthesis was described. Morphine is now convertible into codeine, and efforts that promise well are now being made to convert strychnine into brucine and cinchonine into quinine. Some good medical alkaloids are now being made in the laboratory, and the identical alkaloids of nature may yet be made by art. Prof. Prescott's character as a worker in organic analysis increased the value of his address by the authority it conferred upon it.

In Section D, devoted to mechanical science, the address was delivered by Eckley B. Cox on "The Necessity of Scientific Training for Engineers." The speaker spoke of the peculiarity of his position as an engineer who was really a business man presiding over a meeting of engineers. The divisions of the profession into civil, mining, and other branches, was alluded to. The indebtedness of the working engineer to the scientists who have determined and deduced the many data needed in his work was described. The great success of the early engineers, graduates of the workshop, was achieved in spite of, not on account of, their defective training. The young student of the present day should decide at the start as to the branch of engineering he wishes to follow, whether scientific, consulting, or business. To the proposed course his studies should be adapted.

In Section E, devoted to geology and geog-

raphy, the address was delivered by Grove K. Gilbert on "The Work of the International Congress of Geologists." This topic, in view of the active work of the congress during the past seasons, was a peculiarly timely one, and the address won well-merited recognition for its ability. It was made the subject for general discussion for the whole session of Section E on August 12. He reviewed the history of the congress, tracing its origin to the 1876 meeting of the American Association for the Advancement of Science and Art held in Buffalo. The first convention of the congress was held in Paris, in 1878; the second, in Bologna, in 1881; the third, in Berlin, in 1885. The next meeting is set for London, in 1888, and the fifth meeting, it is to be hoped, will be held in the United States. The work of the congress in unifying geological nomenclature, classification, and conventions, as of map-colors and similar points, was described. The great map of Europe, in forty-nine sheets, in preparation by the congress, was spoken of. A long account of the basis for the scheme of classification followed—the divisions of groups, systems, series, and stages being described and defined.

In Section F, devoted to biology, the address was delivered by Prof. William G. Farlow on "Vegetable Parasites and Evolution." His address was devoted to the application of the Darwinian theory to the parasitical forms of plant-life. The two classes "saprophytes," or those living on dead matter, and the true "parasites" growing on living matter, were described. Thus the mold on bread is a saprophyte, and the potato-rot fungus the true parasite. Most parasites belong to the fungi. The various views of the evolutionists as to their origin were stated, and left open for adoption. The speaker evidently felt that no fixed conclusion could be reached in the light of present knowledge.

In Section G, devoted to anthropology, the address was by Prof. Daniel G. Brinton, "A Review of the Data for the Study of the Prehistoric Chronology of America." An exhaustive classification and statement of the material at our disposal for building up the prehistoric annals of this country was given. Six sources of information are at our disposal; Legends, Monuments, Industries, Language, Physical Sources, Ethnology, and Geology comprise our sources of information. When these various data have been sufficiently studied a large increase in our knowledge of the early history of our continent may be anticipated. A field for much thought and work was outlined, and a precision of result at least foreshadowed in this address.

In Section I, devoted to economic science and statistics, the address was by Prof. Henry E. Alvord on "Economy in the Management of the Soil." The speaker stated that the visible wealth of the country could be traced principally to the soil, which has been hitherto drawn upon with reckless prodigality, no systematic

effort being made to prevent absolute deterioration or exhaustion. Land excepted, the value of the possessions of the people does not equal the sum total of three years' production of our industries. Food, clothing, shelter, and fuel are almost entirely derived from or dependent on the soil. For twenty years agricultural products have constituted three quarters of our exports. This involves a heavy drain upon the nitrogen, phosphoric acid, and potash of the soil. Hence we should witness with feelings of congratulation the increase of interest in agricultural studies and the number of men of ability who are making them their life's work.

Other Papers.—Prof. Edward S. Morse delivered his address as retiring president on "What American Zoologists have done for Evolution." It was a very able presentation of the present aspect of the Darwinian theory. The speaker appeared as a strong partisan of and advocate for the doctrine of evolution, and appealed to the standing of American naturalists on the subject, as well as to observed facts in natural history in support of his arguments. His address was very long, and gave a full presentation of the subject. It referred more particularly to the work done for the establishment of the theory during the last ten years.—Prof. Lucien I. Blake, of Terre Haute, spoke on "A Method of Telephonic Communication at Sea." It described the use of the sea-water as a sound-bearing medium, and gave an account of some of the author's experiments in sound-transmission by water without the aid of a telephone. These were performed in 1883-'85, and were believed to antedate all attempts at devising telephonic methods. Drs. Michelson and Morley excited much attention, and received quite an ovation for the researches on "A Method for making the Wave-Length of Sodium Light the Actual and Practical Standard of Length." This proposal amounted to fixing a definite natural standard for measurements of all kinds, something that has never yet been obtained. The metre was only an unsuccessful effort to obtain such a standard. The society immediately voted to recommend the council to appropriate money to continue the investigation in order that a new unit might be produced, to be known as the American Association unit. This would be a worthy rival to the British Association or B. A. units. Prof. Lewis M. Norton spoke on "The Fatty Acids of the Drying Oils," treating of linoleic acid, the characteristic of linseed-oil and ricinoleic acid (of castor-oil). Prof. Arthur L. Green, of Purdue University, presented a scheme of analysis entitled "A Process for the Separation of Alkaloidal Poisons for Students' Use." An interesting paper was presented by Prof. Robert H. Thurston, of Cornell, on "The Strength of Nicaraguan Woods." It embodied the results of a research by Rufus Flint, a native of Nicaragua. It proved that in that country there exist most valuable varieties of wood. The present im-

pending wood-famine may, the speaker said, be averted by the use of tropical timber. "The American System of Water Purification," and notes on a recent outburst of typhoid fever, its cause and cure, were given by Prof. Albert R. Leeds, of Stevens Institute. Rev. Dr. William M. Beauchamp discussed "Aboriginal Villages in New York State." This gave a vivid picture of the old forts, stockades, and long houses of the Iroquois Indians, and alluded to the tenure of land among the aborigines. Prof. Wilber O. Atwater gave papers on "The Economy of Food" and "Food of Working-men and its Relations to Work done." In these the question was brought down to the most practical basis of cost and nutritive value. The American workman, he said, eats one half more than the German; his daily food represents 6,776 foot tons of potential energy. A description of the Boston cooking-schools, by Mrs. Ellen H. Richards, appropriately followed Prof. Atwater's laborious and practical papers. Later, the Panama Canal and the rival plans for crossing the Isthmus were treated by several essayists. Commander Taylor, U. S. N., in his paper on "The General Question of Isthmian Transit," and Civil Engineer R. E. Peary, U. S. N., in his paper on "The Engineering Features of the Nicaragua Canal," presented two aspects of the problem, while Mr. J. W. Miller, of the Nicaragua Steamship Company, on "Historical and Geographic Notes concerning the Nicaragua Canal Route," and Surgeon J. F. Bransford, U. S. N., on "Climatic and Sanitary Notes on the Nicaragua Canal Route," gave some practical views of the case. Prof. George F. Barker read two papers by Thomas A. Edison on a direct conversion of heat into electricity effected by "The Pyro-Magnetic Dynamo" and on "A Magnetic Bridge or Balance for Measuring Magnetic Conductivity." These can not well be described here, but both mark an important advance in electrical science.

Many entertainments and visits to places of interest filled up the leisure hours, and finally on Monday, Aug. 16, the Association adjourned.

Committees, Etc.—President Langley appointed Professors E. D. Cope, J. R. Eastman, and G. K. Gilbert, a committee to devise methods of obtaining from Congress a reduction of the tariff on scientific books. Miss Alice C. Fletcher and Mrs. T. Stephenson were appointed a committee to petition Congress to take the necessary steps to preserve the archaeological monuments on the public lands of the United States.

A resolution was passed recommending the publication by the Government of an index to the literature of meteorology, now being prepared by the Chief Signal-Service officer, Cleveland Abbe. Another resolution urged President Cleveland to appoint at once a permanent superintendent of the United States Coast and Geodetic Survey. A third petitioned Congress to provide a Bureau of Standards, by which accurate standards of measure should be estab-

lished for electricity, heat, and light, and arrangements made for the issue of authenticated copies of the same.

Election.—The following officers for the next meeting were elected: President, Major John W. Powell, of Washington; Vice-Presidents, by sections: Mathematics and Astronomy, Prof. Ormand Stone, of the University of Virginia; Physics, Prof. Albert A. Michelson, of Cleveland, Ohio; Chemistry, Prof. O. E. Monroe, of the U. S. Navy, Newport, R. I.; Mechanical Science, Prof. O. W. Woodward, of the Washington University, St. Louis; Geology and Geography, Prof. G. H. Cook, New Brunswick, N. J.; Biology, Prof. C. V. Riley, Washington; Anthropology, Prof. Charles O. Abbott, Trenton, N. J.; Economic Science and Statistics, O. W. Smiley, Washington; Permanent Secretary, Prof. F. W. Putnam, Cambridge; General Secretary, Prof. J. C. Arthur, Lafayette, Ind.; Secretary of the Council, Prof. C. Leo Mees, Athens, Ohio; Treasurer, William Lilly, Mauch Chunk; Secretaries of sections, in order, Prof. O. L. Doolittle, Bethlehem, Penn.; Dr. A. L. Kimball, Johns Hopkins University; Prof. W. L. Dudley, Nashville; Prof. George H. Williams, Johns Hopkins University; Prof. Arthur Beardsley, Swarthmore College; Dr. N. L. Britton, Columbia College; Prof. Frank Baker, Smithsonian Institution; and Prof. C. S. Hill, Washington.

The place for the next meeting is Cleveland, and the date the fourth Wednesday in August, 1888.

British.—The British Association for the Advancement of Science held its fifty-seventh annual meeting in Manchester beginning August 31, 1887. Great preparations were made to insure the success of the third Manchester meeting of the Association. Owens College was selected as the place of meeting. Nearly every distinguished man of science abroad it is said had a letter of invitation to attend the meeting. The total attendance amounted to nearly 4,000. Among those Americans who accepted may be noted the following: Prof. C. V. Riley, Washington, D. C.; Prof. H. A. Rowland, of Baltimore, Md.; Asa Gray, of Cambridge, Mass.; Charles A. Young, of Princeton, N. J.; Frank W. Clarke, of Washington, D. C.; John W. Langley, of Ann Arbor, Mich.; Cleveland Abbe, of Washington, D. C.

President's Address.—The inaugural address by the president, Sir Henry E. Roscoe, treated of the progress of science during the last fifty years. The speaker uttered a plea for the acceptance of the elements as final constituents of matter, at least for the present, seeming inclined rather to resist Crooke's recent generalizations. He traced the history of chemical and physical science through the line of workers of the past five decades, and ended by a brilliant allusion to the delights of seeking truth and acquiring knowledge.

Section Presidents' Addresses.—In Section A, devoted to mathematical and physical science, the

president, Sir Robert Ball, Astronomer Royal of Ireland, spoke on "A Dynamicable Parable," the theory of screws. This gave a review of its subject in the form of a disputation between a number of fictitious characters, such as Mr. Helix, Mr. Querulous, Mr. Anharmonic, etc. The address reads well, and is probably *sui generis* as far as the annals of the Association are concerned.

In Section B, devoted to chemical science the address was delivered by Dr. Edward Schunck. The speaker first described the chemistry of fifty years ago as he first studied it, contrasting it with that of the present day. Then, with this as a basis, he endeavored to outline what the chemistry of the future would be. The address, from so old a representative of science, possessed a peculiar interest, and will repay careful perusal.

In Section C, devoted to geology, the address was delivered by Sir Henry Woodward. He treated of the world's work in geology. He referred to Sir William Dawson's ideas as to a Federal Union of Geologists with great approval. The International Congress of Geologists was then spoken of with special reference to the 1888 London meeting thereof. Finally, the work of the world's geologists was described briefly, each authority being cited by name, and a valuable *résumé* of the work now going on being thus presented.

In Section D, devoted to biology, the address was delivered by Prof. A. Newton. It was largely devoted to the Darwinian theory, of which the speaker appeared as an eager advocate. He spoke of the fauna of the British colonies, and lamented their rapid extinction, affirming that from them biologists might draw their most valuable lessons.

In Section E, devoted to geography, the address was given by Maj.-Gen. Sir Charles Warren. It was local in its scope, the speaker dwelling upon the importance to the English nation of the dissemination of geographical knowledge among its people.

In Section F, devoted to economic science and statistics, Dr. Robert Giffen, on "The Recent Rate of Material Progress in England." This, too, was of local character, applying to England only.

In Section G, devoted to mechanical science, the address was delivered by Prof. Osborne Reynolds. It was devoted to the progress of the steam-engine toward theoretically perfect results. The lecturer took for a starting point the labors of Clausius, Carnot, Regnault, and the other great students of thermodynamics, and traced the progress from them to the practical results of the present day.

In Section H, devoted to anthropology, the address was delivered by Prof. A. H. Sayce, on the evidence to be obtained from a study of language as to the history and development of mankind.

Other Papers.—Among the papers presented by Americans may be noted those by Prof. O.

V. Riley, of Washington, on the hop aphid, the *Phorodon humuli*, and one by Prof. Charles A. Young, of Princeton, on the work done by his party in observing the eclipse of the sun at a station in Russia. Sir William Thompson read a paper on the Vortex Theory of the Luminiferous Ether. This showed mathematically that a perfect fluid completely enwrapped in minute vortices would do everything that the luminiferous ether was called on to do. The paper had its origin in the theory proposed by Prof. Fitzgerald, of Dublin. It is regarded as one of the events of the meeting, and as marking the nearest approach yet made to the mathematical conception of the ether.

Several committee reports were read on solar radiation, magnetic observations, electrolysis, and other subjects.

Various public lectures were given. Prof. H. B. Dixon spoke on "The Rate of Explosions"; Prof. George Forbes gave a working-men's lecture on "Electricity"; Sir Francis de Winton spoke on "Exploration in Central Africa."

In connection with Section H, an anthropometric laboratory has been established. Many of the members of the Association were here weighed, measured, and subjected to various tests to obtain data as to the statistics of the cultivated class to compare with those gathered from all classes, by Mr. Francis Galton, of South Kensington.

Grants.—The total grants for researches made by the Association amounted to £2,025, ranging from £5 to £200 each, and divided among all the branches.

ASTRONOMICAL PROGRESS AND PHENOMENA.

During 1887 the usual steady advance was made in all departments of astronomy, but attention was specially concentrated upon celestial photography and the total solar eclipse of August 19. Among the notable events of the year was the twelfth meeting of the International Astronomische Gesellschaft, which was held at Kiel, from August 29 to August 31, under the presidency of Dr. Auwers.

Instruments and Methods.—In volume xvii of the "Annals" of the Harvard College Observatory, S. C. Chandler has published a description and theory of his "almucantar," and a reduction and discussion of a long series of observations made with it in 1884-'85. The instrument, which belongs to the equal-altitude class, consists of a telescope mounted upon a base floating in mercury, and the observations are made by noting the times when stars cross the horizontal circle defined by the wire system of the telescope. In the hands of the inventor this instrument has given most excellent results; but experience alone can decide whether it will prove superior to the ordinary zenith telescope in the hands of other persons. Be that as it may, equal-altitude instruments enjoy such a remarkable immunity from systematic errors, that astronomers must ultimately have recourse to them in order to elim-

inate the small systematic errors inseparable from meridian work.

M. Loewy, of the Paris Observatory, has proposed a method of determining the constant of aberration from differential measurements of the changes in the distances of suitably-chosen pairs of stars. In all the pairs the two constituents must be separated by nearly the same interval—say about 90° —and the changes in the distance of each pair are to be measured in the field of an equatorial into which the stars have been reflected by a double mirror, formed by silvering two surfaces of a glass prism. The method is explained at length in several papers printed in the "Comptes Rendus," volumes civ and cv. M. Houzeau claims that in 1871 he suggested the principle upon which this method depends. Sir Howard Grubb has written an elaborate paper on the best forms of instruments for astronomical photography, and has made some experiments with a new object-glass, suggested by Prof. Stokes, which can be changed at pleasure from an ordinary visual objective to a properly corrected photographic lens. The change is effected by merely separating the lenses, but for photographic purposes the field of view is rather small. Prof. Abbe has called attention to a heretofore neglected correction in the computation of refraction, arising from the circumstance that the reading of the barometer does not give the true weight of the air until it has been corrected for the variation of gravity due to the latitude of the observer. By applying this correction to the Pulkowa refraction-tables, Prof. Abbe finds that at the equator the correction amounts to 0.2" for a zenith distance of 45° , and increases with the tangent of the zenith distance. The omission of the correction may, perhaps, explain some of the small systematic differences now existing in star catalogues. Prof. J. M. Schaeberle, of the Ann Arbor Observatory, has recently published a short method of computing refractions for all zenith distances, but his formulæ scarcely differ from those given in the Pulkowa refraction-tables.

Astronomical Photography.—Nothing is more remarkable than the way in which the world at large will neglect an important invention or discovery for years, and then suddenly take it up with the wildest enthusiasm. This was well illustrated by the recent electrical craze, during which many persons actually believed that gas-lighting antedated electrical lighting; and now photography is having its turn. The old bromo-iodized daguerreotype plates were not as sensitive as the best wet collodion plates, but they would have borne as long exposure as a modern dry plate, and much of what is now done with gelatine plates might have been accomplished with them. They were inferior to gelatine plates in convenience of working, in extreme sensitiveness, and in the impossibility of printing paper positives from them; but they were superior in the se-

curity which they afforded against the images being disturbed by slipping of the film. The daguerreotype process was made public in 1839, and in March, 1840, prior to the introduction of bromine for increasing the sensitiveness of the plates, Dr. John W. Draper, of New York, took some daguerreotypes of the moon about one inch in diameter, with an exposure of twenty minutes. Daguerreotypes were taken of the total solar eclipse of July 8, 1842, by Prof. Majocchi, at Milan, and of the total solar eclipse of July 28, 1851, by Father Secchi, at Rome, and by Dr. Busch, at Königsberg. Dr. Busch's pictures being the first that showed the corona. The first eclipse photographed on collodion plates was that of Sept. 7, 1858, some negatives of the partial phases being made by Liais in South America. All the pictures thus far mentioned were made with ordinary astronomical telescopes, corrected for visual rays, and it was not till the total eclipse of July 18, 1860, that De la Rue introduced the use of equatorial cameras, having lenses specially corrected for photography, the particular instrument employed being one that had been constructed under his direction in 1855-'56 for the Kew Observatory. Since then all solar eclipses have been observed with what may be called modern instruments. The first daguerreotype of the uneclipsed sun was made in 1845 by Fizeau and Foucault. After Draper's daguerreotypes of the moon, it is not known that any more were made until 1850, when the Bonds took up the subject, and with the Cambridge 15-inch telescope produced daguerreotypes of such excellence that they attracted marked attention in the Great Exposition held in London in 1851. These pictures incited De la Rue to take up photography, and toward the end of 1852 he made some beautiful negatives of the moon, which were remarkable as being the first astronomical pictures taken on collodion. Since that time photographs of the moon have been made by many persons, but those produced by Lewis M. Rutherfurd and Dr. Henry Draper are unrivaled. On July 17, 1850, the Bonds, aided by Messrs. Whipple and Black, of Boston, daguerreotyped a Lyrae by means of the Cambridge 15-inch telescope, and this was the first stellar photograph ever made. The double star Castor was subsequently daguerreotyped, but the experiments were soon abandoned on account of the length of the exposures—indeed, for some reason hard to comprehend at the present day, they were unable to obtain any impression whatever from Polaris, no matter how long the exposures were continued. In 1857 the Bonds again reverted to the subject, and on April 27 of that year, they made collodion negatives of ζ and g Ursæ Majoris; and the former being a double star, they measured the position, angle, and distance of its components from the negatives, in the manner now in vogue. During 1857 they succeeded in photographing stars of the sixth to seventh magnitudes in less than a hundred seconds,

and they inferred that stars of the ninth magnitude could be photographed in ten minutes. At that time they also made some negatives of Saturn. The next person to take up the subject was Lewis M. Rutherfurd, of New York. In 1857-'58 he worked with an ordinary achromatic telescope; in 1859-'60 he used the same telescope with correcting lenses applied between the objective and the eye-piece; in 1861 he used a silver-on-glass reflector; and having found all these unsatisfactory, in 1864 he constructed a telescopic objective of $11\frac{1}{2}$ inches aperture, specially corrected for photography. With that instrument he obtained photographs of ninth magnitude stars upon wet collodion plates, after an exposure of about three minutes; and thus modern stellar photography came into being. Nevertheless, for twenty years it made little progress, and it is only recently that astronomers seem to have realized its importance. As frequently happens with new processes, there is now a tendency to exaggerate its capabilities, but in due time that will be corrected, and much of the secondary work hitherto done by meridian circles will fall to the photographic camera. The adoption of the new method will doubtless be hastened by the action of the Paris International Congress, an account of which is given below. Photography affords special facilities for the detection of small planets or stars having large proper motion, and it has been successfully used for both these purposes during the past year. By its aid Mr. Roberts determined the position of the asteroid Sappho (80), which is not known to have been observed since 1872, except by Dr. Gill in 1882. The asteroid was of about the eleventh magnitude, and with an exposure of an hour it showed a distinct trail upon the plate. As an instance of the detection of a star's proper motion by the aid of photography, the case reported by Herr von Gothard, in the "Astronomische Nachrichten," may be cited. On examining a photograph of the cluster No. 4440, Herschel's "General Catalogue," taken at the Herény Observatory, he found that a small star of the eleventh magnitude had changed its position relatively to the other stars since Vogel's measurement of the cluster in 1867-'69. The proper motion thus detected amounts to about $2.3''$ per annum. Prof. Pritchard, of the Oxford University Observatory, has published some results, which he regards as provisional only, of his photographic investigation of the parallax of the well-known double star 61 Cygni. The measurement of 830 plates, obtained on 89 nights, gives:

$$\begin{aligned}\text{Parallax of } 61^1 \text{ Cygni} &= 0.4989'' \\ \text{Parallax of } 61^2 \text{ Cygni} &= 0.4858\end{aligned}$$

For comparison we may cite the following results obtained by other astronomers working with equatorials and heliometers in the usual way:

Bessel in 1840	0.345''
Auwers in 1868	0.564
Bail in 1878	0.468
Hall in 1880	0.361

Prof. Pritchard lays stress upon the fact that each plate must be considered as carrying with it its own scale; and, due regard being paid to the unavoidable though slight variations of scale in the different plates, he is of opinion that in this delicate class of work photography will give as accurate results as any other known method. The nebula No. 1180 of Herschel's "General Catalogue" has been photographed by Mr. Roberts in England, and by the Henry Brothers in Paris. The latter made their negative on Jan. 27, 1887, giving it an exposure of two hours, and obtaining an image extending 25' from east to west, and 15' from north to south, with a nebulous star, or condensation, a little detached toward the south. During such long exposures as this it is necessary to guard against displacements of the images upon the sensitive plate, arising from changes in the refraction due to the earth's diurnal motion. Dr. Dryer has investigated the magnitude of these displacements, and finds that in latitude 50° north, with a perfect clock, and an accurately adjusted instrument, they will not exceed 0.5" (and may therefore be neglected) in the case of an equatorial star moving from 27° east to 27° west of the meridian, or in the case of a star of +25° declination moving from 89° east to 89° west of the meridian.

Prof. E. C. Pickering has recently published his first annual report on the photographic study of stellar spectra at the Harvard College Observatory, made with funds provided by Mrs. Draper as a memorial to her husband, the late Dr. Henry Draper. The results already obtained are so encouraging that Mrs. Draper has decided to extend the original plan of the work sufficiently to embrace a complete discussion of the constitution and conditions of the stars as revealed by their spectra, so far as present scientific methods permit. In order to reach all parts of the sky, it is expected that a station will be established in the southern hemisphere. The investigations already undertaken extend only to declination -24°, and include a catalogue of the spectra of all stars of the sixth magnitude and brighter, a more extensive catalogue of spectra of stars brighter than the eighth magnitude, and a detailed study of the spectra of the bright stars. Three telescopes have been used in the work: an 8-inch Voigtländer photographic lens refigured by Alvan Clark & Sons, Dr. Draper's 11-inch photographic lens, and the 15-inch refractor of the Harvard Observatory. The spectra have been produced by returning to Fraunhofer's method of placing a large prism in front of the object-glass. The spectrum of a star formed in that way is extremely narrow when the telescope is driven by clock-work in the usual manner, but it may be broadened as much as is desired by giving the telescope a speed slightly different from that of the earth. The negatives were subsequently enlarged; and a specimen print is given of part of the spectrum of Pollux on a scale that would separate *H* and *K* by nine-

tenths of an inch. In a comparatively short space it shows nearly 180 lines with remarkable clearness. Several points of interest have been already brought out by Prof. Pickering's work. A photograph of α Cygni, taken Nov. 26, 1886, shows the *H* line double, its two components having a difference in wave-length of about one ten-millionth of a millimetre. A photograph of α Ceti shows the lines *G* and *h* bright, as are also four of the ultra-violet lines characteristic of spectra of the first type. The *H* and *K* lines in this spectrum are dark, showing that they probably do not belong to that series of lines. The star near χ^1 Orionis, discovered by Gore in December, 1885, gives a similar spectrum, which affords additional evidence that it is a variable of the same class as α Ceti. Spectra of Sirius show a large number of faint lines, besides the well-known broad lines. Progress is reported in the various investigations that are contemplated, namely: 1. Catalogue of spectra of bright stars. 2. Catalogue of spectra of faint stars. 3. Detailed study of the spectra of the brighter stars. 4. Faint stellar spectra. 5. Absorption spectra. 6. Wave-lengths. Mrs. Draper has decided to send to Cambridge a 28-inch reflector and its mounting, and the remarkably perfect 15-inch mirror constructed by Dr. Draper and used by him in making his photograph of the moon.

The literature respecting the use of photography in astronomy has recently been enriched by articles written by Mr. A. A. Common; Dr. David Gill, Astronomer Royal at the Cape of Good Hope; Prof. E. S. Holden, Director of the Lick Observatory; Admiral Mouchez, Director of the Paris Observatory; M. G. Rayet, Director of the Bordeaux Observatory; Otto Struve, Director of the Pulkowa Observatory; and Prof. C. A. Young, of the Princeton Observatory. Some of these articles are mainly historical, others are theoretical and practical, and still others are of a more popular character. Among the historical articles those by M. Rayet, in the "Bulletin Astronomique," are particularly noteworthy on account of their completeness and accuracy.

The Paris International Astrophotographic Congress.—In compliance with the request of Admiral Mouchez, an International Congress of Astronomers was called in April by the French Academy of Sciences, to take steps to obtain a photographic chart of the heavens upon the co-operative plan so successfully carried out by the German Astronomische Gesellschaft in their zone observations. The Congress was opened at the Paris Observatory on April 16, by M. Flourens, Minister of Foreign Affairs of the French Government, and addresses were made by M. Bertrand, the eminent mathematician, by Admiral Mouchez, Director of the Paris Observatory, and by Prof. Struve, Director of the Pulkowa Observatory. Admiral Mouchez was chosen honorary president; Struve, president; Auwers, Christie and Faye, vice-presidents; Bakhuyzen and Tisserand,

secretaries; and Dunér and Trépied, assistant secretaries. At the first meeting a committee of nineteen was appointed to consider and report upon the size and construction of the instruments to be employed, and upon the limit of star-magnitudes to be included in the photographs. This committee reported on April 19, and after some discussion it was decided to divide the Congress into two sections—one to deal with purely astronomical questions, and the other with those involving photography. Each section drew up a series of resolutions, which were further discussed and amended by the Congress in full session, and were finally adopted in the following form:

1. The progress made in astronomical photography demands that astronomers of the present day should unite in undertaking a description of the heavens by photographic means.

2. This work shall be carried out at selected stations, and the instruments shall be identical in their essential parts.

3. The principal objects shall be:

a. To prepare a general photographic chart of the heavens for the present epoch, and to obtain data which shall enable us to determine the positions and magnitudes of all stars down to a certain magnitude, with the greatest possible accuracy (magnitudes being understood in a photographic sense to be defined later).

b. To be able to utilize in the best way, both in the present and in the future, the data obtained by photographic means.

4. The instruments employed shall be exclusively refractors.

5. The stars shall be photographed as far as the fourteenth magnitude, inclusive; this magnitude being indicated provisionally by the scale actually in use in France, and with the reservation that its photographic value shall be definitely fixed afterward.

6. The aperture of the object-glasses shall be 0.33 metre (13.0 inches), and the focal length about 8.43 metres (11.4 feet), so that a minute of arc shall be represented approximately by 0.001 metre.

7. The directors of observatories shall be at liberty to have the object-glasses made where they desire, provided they fulfill the general conditions laid down by the Congress.

8. The applanatism and achromatism of the objectives shall be calculated for radiations near the Fraunhofer ray G.

9. All the plates shall be prepared according to the same formula; this formula to be subsequently agreed upon.

10. A permanent control of these plates from the point of view of their relative sensibility to the different radiations shall be instituted.

11. Questions in regard to the preservation and reproduction of the negatives can not at present be settled, and shall be referred to a special committee.

12. The same conclusions are adopted in regard to the photographic magnitudes of the stars.

13. Resolution 8 above, in regard to the applanatism and achromatism of the object-glasses, shall be understood in the sense that the minimum focal distance shall be that of a ray near G, so as to attain the maximum sensibility of the photographic plates.

14. The object-glasses shall be constructed in such a manner that the field to be measured shall extend at least 1° from the center.

15. In order to eliminate fictitious stars, and to avoid inconvenience from minute specks which may exist upon the plates, two series of negatives shall be made for the whole sky.

16. The two series of negatives shall be so made that the image of a star, situated in the corner of a plate of the first series, shall be found as nearly as possible in the center of a plate of the second series.

17. Besides the two negatives giving the stars down to the fourteenth magnitude, another series shall be made with shorter exposures, to assure a greater precision in the micrometrical measurement of the fundamental stars, and render possible the construction of a catalogue.

18. The supplementary negatives, destined for the construction of the catalogue, shall contain all the stars down to the eleventh magnitude approximately. The Executive Committee shall determine the steps to be taken to insure the fulfillment of this condition.

19. Each photographic plate to be used in the formation of the catalogue shall be accompanied by all the data necessary to obtain the orientation and the value of its scale; and, as far as possible, these data shall be written on the plate itself. Each plate of this kind shall show a well-centered copy of a system of cross-wires for the purpose of eliminating errors which may be produced by a subsequent deformation of the photographic film. Further details of this nature shall be determined by the Executive Committee.

20. In the negatives intended for the map, the number of cross-wires to be used in their control and reduction shall be reduced to a minimum.

21. The tubes of the photographic instruments shall be constructed of the metal most likely to give an invariable focal plane, and shall carry a graduation for the determination and regulation of the position of the plate.

22. The Executive Committee shall choose the reference stars to be used.

23. The question of the methods of measurement, and the conversion of the numbers obtained into right ascensions and declinations for the equinox of 1900, is left to the Executive Committee. That committee shall first occupy itself with the study and methods of use of measuring-instruments, giving either rectangular or polar co-ordinates, and based upon the simultaneous use of scales for the larger distances, and micrometer screws for scale subdivisions.

24. The connection of the plates will be effected in conformity with resolution No. 16.

At the last general session, April 25, the Congress elected a permanent committee of eleven, consisting of Christie, Dunér, Gill, Paul Henry, Janssen, Loewy, Pickering, Struve, Tacchini, Vogel, and Weiss, and it was decided that all directors of observatories actually taking part in the work of forming the map should, by virtue of that circumstance, become members of this committee. The observatories of Algiers, Bordeaux, Buenos Ayres, Paris, Rio de Janeiro, and Toulouse, were announced as now ready to undertake their share in the new work, and Trépied, Rayet, Beuf, Mouchez, Orula, and Baillaud were thus added to the committee. An Executive Bureau of this committee was elected, consisting of Mouchez, president; Christie, Dunér, Janssen, Struve, and Tacchini, members; and Gill, Loewy, and Vogel, secretaries. A special committee was also elected by the Congress to occupy itself with the application of photography to astronomy, other than the construction of the map, having regard to the importance of all these applications, and to the relations that it is desirable to establish between these different kinds of work. Common and Janssen were requested to take charge of this matter. It is intended that the Executive Committee shall meet every year at one of the observatories engaged in the photographic work, and reports of these meetings will be published.

Observatories in the United States.—At the Naval Observatory in Washington the 26-inch equatorial has been used by Prof. Hall in observations for stellar parallax, and also in observations of satellites, of double stars, and of Saturn. The transit-circle work has been continued as in former years, and comets and asteroids have been observed with the 9.6-inch equatorial. Prof. Frisby has been engaged upon a revision of Yarnall's catalogue. The facilities for testing chronometers have been improved, and the time-service has recently been considerably extended. About 200 "Gardner clocks" are automatically corrected daily by a signal from the observatory, and time-balls are dropped at New York, Philadelphia, Baltimore, Washington, Hampton Roads, Savannah, and New Orleans. For the erection of a new observatory upon the site near Washington purchased in 1880, Congress has appropriated \$100,000, with the provision that the cost of the whole work shall not exceed \$400,000. The plans for the new buildings are now being prepared.

The latest report of the Director of the Harvard College Observatory, at present available, was submitted to the visiting committee Dec. 7, 1886. The extensive series of photometric observations has been continued, with gratifying success. Stellar photography is now receiving considerable attention, and interesting results have been obtained, to which reference has elsewhere been made. The financial resources have recently been greatly increased. The Paine bequest, half of which, about \$164,000, is now available, has been added to the endowment of the observatory; and the Boyden fund of over \$280,000—which was left for the purpose of making observations "at such an elevation as to be free, so far as practicable, from the hindrances to accurate observations, which occur in the observatories now existing, owing to atmospheric influences"—has been transferred to the President and Fellows of Harvard College, so that the researches Mr. Boyden had in view may be carried out under the administration of the observatory. Prof. Pickering has already occupied, during the past summer, a high station in Colorado for experimental purposes, and intends eventually to establish an observatory in the southern hemisphere, where a series of photographic observations will be carried on supplementary to similar work at Cambridge.

The report of the Dearborn Observatory of Chicago for 1885 and 1886 has lately been issued. It contains a list of nebulae discovered there by Prof. T. H. Safford in 1866-'68; papers on the motion of the lunar apsides, and on the companion of Sirius by Prof. E. Colbert; and an illustrated paper on the physical aspect of Jupiter, a catalogue of 209 new double stars, and a description of a printing chronograph, by Prof. G. W. Hough. The lawsuit respecting the ownership of the instruments has been decided in favor of the observatory.

The first of the publications of the Morrison Observatory, Glasgow, Mo., is a well-printed volume of 111 pages, giving an account of the founding of the observatory, with a full description of the building and instruments, and the observations in detail. The instruments consist, chiefly, of a 12½-inch Clark equatorial, and a 6-inch Troughton and Simms meridian circle, similar in plan to the meridian circle of the Harvard Observatory. Observations of double stars, of planets, comets, and occultations by the moon have been made by the director, Prof. C. W. Pritchett, assisted by Prof. H. S. Pritchett and C. W. Pritchett, Jr.; and as a preliminary work the geographical co-ordinates of the meridian circle were determined. The volume contains several drawings of the observatory, and sketches of Saturn and of comets.

Prof. Stone has devoted the 26-inch refractor of the McCormick Observatory mainly to the study of nebulae; an especial feature of his work being the determination of accurate positions of all the nebulae north of 80° south declination, which are condensed at the center and as bright as the fourteenth magnitude. The great nebula of Orion has been repeatedly examined, for the purpose of determining the relative brightness of the various condensations composing it, and thus of furnishing means of detecting any change that may take place in them. Prof. Stone speaks highly of the electric illumination, which he has applied to the equatorial.

The Washburn Observatory, which was left without a director upon Prof. Holden's resignation in the winter of 1885, was placed temporarily under the charge of Prof. John E. Davies, on July 1, 1886, and Prof. Davies has now been succeeded by Prof. G. C. Comstock, who served as assistant in the observatory to both Prof. Holden and his predecessor, Prof. Watson. The fifth volume of publications, giving an account of the work accomplished down to April 1, 1887, has been issued by Prof. Davies. With the meridian circle a series of observations has been made for the determination of the latitude, and a discussion of that co-ordinate is given by Mr. Updegraff. A list of stars has also been observed in declination, with this instrument. The 15½-inch equatorial has been used for measuring double stars and for observations of Sappho (80) and of comet 1887 II. Miss Lamb contributes a useful index to certain stars contained in various Greenwich catalogues.

The 36-inch lenses of the great refractor of the Lick Observatory were safely transported across the continent, and were deposited in the vaults of the Lick Observatory on Dec. 27, 1886. The safe transportation was a matter of great moment to the trustees. The lenses were wrapped separately in fifteen or twenty thicknesses of soft cotton cloth, and were put into separate wooden boxes lined with felt. No nails were used near the glasses,

and the boxes were made to fit the latter in shape. These boxes were inclosed in two others of steel, each nearly cubical, and packed with hair. Each steel box was then inclosed in another steel box, the inner sides of which were covered with spiral springs, and both boxes were made air-tight and water-tight and placed in outer chests packed with asbestos to render them fire-proof. They were then suspended by pivots in strong wooden frames, with means for turning one-quarter round every day during the journey. This was in order to prevent any molecular disarrangement in the glasses, and to avoid the danger of polarization, through the jarring of the train. The great 75-foot dome is in place and works well. It revolves with a longitudinal pressure of 225 pounds, so that the hydraulic machinery provided is almost unnecessary. Work upon the mounting, which is still in the hands of Messrs. Warner and Swasey, is progressing favorably.

The new observatory of Bucknell University, Lewisburg, Pa., was finished early in 1887. It is provided with a 10-inch Clark equatorial, and a 3-inch transit instrument. Creighton College, at Omaha, also has a new observatory, with a 5-inch equatorial and a 3-inch transit. An exchange of longitude-signals was made with the Naval Observatory, Washington, in August, 1887.

The Solar Parallax.—The report of the committee appointed to superintend the arrangements for the British expeditions to observe the transit of Venus in 1882, together with the report of Mr. Stone, who had charge of the reductions, has recently been published as a Treasury document. Expeditions were sent from England to Jamaica, Barbadoes, Bermuda, Cape of Good Hope, Madagascar, New Zealand, and Brisbane, Australia; and the observers were successful at all these stations except Brisbane, where the sky was cloudy. The British committee were not satisfied with their photographic work in 1874, and for various reasons they decided to rely entirely upon contact observations in 1882. From the observations of external contact at ingress, Mr. Stone has obtained a parallax of $8.760'' \pm 0.122''$; from those of internal contact at ingress, $8.823'' \pm 0.028''$; from those of internal contact at egress, $8.855'' \pm 0.036''$; and from those of external contact at egress, $8.953'' \pm 0.048''$. The most probable combined result he considers to be $8.882'' \pm 0.024''$, which corresponds to a mean distance of $92,560,000 \pm 250,000$ miles between the earth and the sun.

The commissions of the United States and France trusted principally to photography in their schemes for observing the transit of 1882. Of the negatives obtained under the auspices of the United States Commission, after the rejection of all imperfect ones, there remained 1,571 which have been measured, and Prof. Harkness believes that the value of the solar parallax deducible from them will be obtained early in 1888. The French Commission have

measured 1,019 of their negatives, and in February, 1887, M. Bouquet de la Grye announced to the Academy of Sciences that the computations necessary for their reduction were half finished, and would probably be completed about the end of 1887.

The German Commission trusted principally to heliometers in the observations made under their direction, and Dr. Auwers has recently published a large volume containing investigations of the constants of the instruments employed; but it is not known when the resulting parallax will be obtained.

The Sun.—During 1886 sun-spots were confined almost entirely to the southern hemisphere of the sun, and there was a decided decrease in their size and number, relieved only by outbursts in March and May. Faculae and eruptions seemed to follow the spots. The prominences diminished in height and mean extent, but they were nearly equally divided between the two solar hemispheres, and the decrease was not so rapid as in the case of the spots. The Greenwich photographs, supplemented by those from Dehra Dûn in India, show that for the thirty-eight days beginning Oct. 31 and ending Dec. 7, 1886, there were only seven days on which even a single spot was shown. For a rotation and a half the sun was practically free from spots. Riccò, on searching the Palermo records, finds a similar case in 1875, five years after the maximum of 1870, and nearly eight years after the minimum of 1867. He predicts that the true minimum of the eleven-year period will fall in 1890. Wolf's observations at Zürich show that the variations in the spots and in magnetic phenomena kept together in 1886 as in previous years.

An exhaustive discussion of the sun's horizontal and vertical diameters, with special reference to the alleged variations in its mean annual diameter following the period of the sun-spot cycle, has been made by Dr. Auwers from the Greenwich, Washington, Oxford, and Neuchâtel meridian observations. He concludes that there is no valid reason for supposing the sun's diameter to vary, and that the apparent changes arise from insufficiently determined personal equations. He also points out that meridian observations are quite unsuited for determination of any possible ellipticity in the sun's disk, and that there is no reason to conclude from these results that such ellipticity exists. The several mean values of the sun's (assumed circular) diameter are: Greenwich, $32' 02.37''$; Washington, $32' 02.51''$; Oxford, $32' 02.19''$; Neuchâtel, $32' 03.27''$, the discordances of which are to be ascribed to instrumental or uneliminated personal peculiarities. In a second paper, Dr. Auwers discusses the apparent changes of both the horizontal and vertical diameter during the course of a year deduced from meridian observations, and he concludes that the periodic variations in the monthly value of the diameters result not from

physical changes in the sun, but from the effect of temperature on the instruments, and from difference in the quality of the telescopic images at opposite seasons of the year. Another discussion of the horizontal diameter of the sun has been made by Prof. di Legge from meridian transits of the sun observed at Campidoglio from 1874 to 1888. The mean horizontal diameter at mean distance deduced from 5,796 transits by four observers on 2,218 days is $32' 02.38''$. From May, 1876, the sun's transit has been observed by projection, thus enabling two or more persons to observe simultaneously, and thereby affording exceptionally favorable opportunities for the determination of personal equation.

Prof. John Trowbridge and Mr. O. C. Hutchins have recently investigated the solar spectrum with very powerful apparatus, and they find that the alleged bright bands, upon which Dr. Henry Draper based his so-called discovery of oxygen in the sun, do not exist. They have also examined Prof. J. O. Draper's hypothesis of the coincidence of certain dark lines in the solar spectrum with the lines in the spectrum of oxygen, and find it equally destitute of any physical basis.

Total Solar Eclipse of August 19, 1887.—This eclipse excited the greatest interest throughout Europe, and will be memorable as the first during which attempts were made to observe and photograph the corona from balloons. At Berlin the totality began at 5:05 A. M., and as there were few favorable points for observation within the city, the people flocked by tens of thousands out into the open country, whither they were conveyed by special trains, steamboats, and vehicles innumerable. The principal streets of the city were more thronged from 2 to 4 A. M. than they usually are at midday, and the Tempelhof field never held a larger crowd during a grand review than at day-break on the morning of the eclipse. Most of the people obtained only momentary glimpses of the partial phases; but those at Hoppegarten, ten miles east of Berlin, were more highly favored. There the totality was concealed only by a thin veil of clouds, through which both the chromosphere and the corona were visible; but unfortunately no skilled observers were present. While totality lasted, the darkness was so great that it was hardly possible to recognize faces at a yard's distance.

In Russia, quite unprecedented preparations were made for the occasion, and, had the weather been favorable, this eclipse would have been observed and investigated there in the most thorough manner. An intelligent taste for scientific work is very widely spread among educated Russians, and their enthusiasm on this occasion may be imagined from the sale in Moscow alone of 145,000 glasses and 400,000 descriptive pamphlets. Enlightened by this surprising quantity of popular literature, the Russians of all classes flocked in great numbers to many points of observation. For

the first time in Russia, an excellent service of cheap excursion-trains was organized, with traveling comforts such as are only to be had on the great trunk-lines. Even the Grand Duke Constantine, who selected Tver as his point of view, did not disdain to travel by a special train of this class on the Nicholas Railway. During the night preceding the eclipse, about 300 persons went to Klin from St. Petersburg, and about 600 more from Moscow. The Physical Society of St. Petersburg distributed papers, with directions for amateur observations, to all passengers in the special train on the Moscow line, but the weather turned out so badly that probably not one of the blanks was filled out by the disappointed enthusiasts. Among the visitors to Russia were many distinguished foreign astronomers, all of whom were received with the utmost kindness, and assisted in every possible way.

The central line of the eclipse first struck the earth at a point 58 miles west-northwest of Leipsic, in latitude $51^{\circ} 88'$ north, longitude $11^{\circ} 16'$ east of Greenwich, where the sun was just rising. From there the line of totality, which was about 185 miles wide, sped across Germany, Russia, Siberia, China, and Japan, and finally left the earth at a point in the Pacific Ocean, in latitude $24^{\circ} 27'$ north, longitude $178^{\circ} 80'$ east, where the sun was just setting. The actual distance traveled by the shadow was about 7,960 miles, and the time occupied was $2^h 42^m 12^s$, whence the average rate of motion was 49 miles a minute, say fifty times that of an express train, or twice that of a shot from a modern, high-powered, rifled gun—but the speed was considerably less near the middle of the path, and greater toward its ends. The entire duration of the partial phase of the eclipse upon the earth's surface was $4^h 53^m 24^s$. In Germany the sun was too low during totality for advantageous photographic and spectroscopic work, and for such observations it was necessary to go farther east. The best localities were in Eastern Siberia, about latitude $50^{\circ} 30'$ north, longitude 112° east, but, as it was practically impossible to transport heavy instruments beyond the Ural mountains, and in the immediate neighborhood of these mountains the meteorologists thought it likely to be cloudy, nearly all the best equipped parties were concentrated between Moscow and St. Petersburg. This proved most unfortunate, for speaking generally, during the eclipse, the sky westward of the Ural mountains was overcast, while eastward it was beautifully clear. The neighborhood of Moscow and Tver, of which the meteorologists spoke highly as regards the chances of fine weather, was shrouded in clouds and mist, while Yekaterinburg, which they had comparatively condemned, was rejoicing in a clear sky. And, whereas the early morning hours, in which the eclipse took place, are more generally fine than the corresponding evening hours, it so happened that in the

evening of the 19th the eclipse could have been observed most successfully.

In Germany, the Berlin Observatory established six stations on the central line of the eclipse, together with some others near the northern and southern boundaries of the total zone, and many additional points were occupied by well-known astronomers; but fog, rain, and clouds prevailed to such an extent that only at Nordhausen and Eisleben were even partially successful observations obtained. In Russia, west of the Ural Mountains, at least thirty different points were occupied by about one hundred and fifty thoroughly-equipped astronomers and physicists, many of whom had traveled far to see the eclipse, but the weather was so unpropitious that the corona was visible at only five of their stations. In Siberia, where the sky was perfectly clear, only four parties are known to have been located, and their equipment was not of the first order. A party from the United States was stationed in Japan, but there again the weather was bad.

The Satellites of Saturn.—Prof. Hall has pub-

lished, in Appendix I to the "Washington Observations for 1888," a discussion of the orbits of the six inner satellites of Saturn, his main object being to determine, if possible, the motions of the perisaturnia, and the mass of the ring. The observations of the satellites he has discussed were made by Prof. Newcomb and himself with the 26-inch Washington refractor, in 1874, and following years. Prof. Hall finds from these observations that Rhea, Dione, Tethys, Mimas, and Enceladus, move in orbits sensibly circular—a result which, of course, sets aside any consideration of the motion of their lines of apsides. From the elements of Titan Rhea, Dione, and Tethys, the mean result for the mass of Saturn is $\frac{1}{8478.7 \pm 1.10}$, the mass of the sun being taken as unity.

Asteroids.—Six of these little bodies were added to the list during 1887, making the total number now known 270. The following table gives their numbers and names, the names of the discoverers, the dates of discovery, and the principal elements of the orbits, together with the names of the computers:

No.	Name.	Discoverer.	Date of discovery—1887.	Longitude of node.	Inclination.	Eccentricity.	Mean distance.	Computer.
265.....	Anna.....	Palisa, at Vienna.....	February 25.....	885° 27'	25° 47'	0.261	2.43	Knopf.
266.....	Alina.....	Palisa, at Vienna.....	May 17.....	236 18	18 30	0.157	2.81	Lange.
267.....	Tirza.....	Charloia, at Nico.....	May 27.....	74 5	7 19	0.047	2.52	Charloia.
268.....	Borrelly, at Marseilles.....	June 9.....	131 58	2 25	0.129	8.08	Lange.
269.....	Palisa, at Vienna.....	September 21.....					
270.....	Peters, at Clinton.....	October 8.....					

An asteroid, detected by Dr. Luther on April 11, and independently by Coggia on April 16, proved to be Hesperia (69), which had been looked for in vain in 1882, 1885, and in March, 1887. The rapid motion in right ascension of (265) would seem to indicate that it approaches quite near the earth, and is, therefore, suitable for determining a new value of the solar parallax. Of the asteroids "unnamed" in last year's article (256) has been called Walpurga, (261) Prymno, (262) Valda, (263) Dresda, (264) Libussa: (269) was the sixtieth asteroid discovered by Palisa. Dr. de Ball has made a careful discussion of all the observations of Eucharis (181) obtained since its discovery in 1878. He has taken into account the perturbations due to Jupiter and Saturn; and those due to Jupiter seem likely to afford an accurate means of determining that planet's mass.

Comets of 1887.—Including the periodic comet of Olbers, six comets have thus far (October 1) been discovered during the year. As it is now possible to give to the new comets their permanent designations, we record them in the order of perihelion passage:

Comet 1886 VIII, the third comet discovered in 1887, was found by E. E. Barnard, of the Vanderbilt Observatory, Nashville, Tenn., on Jan. 23, or the morning of Jan. 24, civil reckoning, in the constellation Cygnus. A preliminary computation of the elements showed that the comet had passed perihelion in the preceding November, hence it is catalogued with the comets of 1886. Although a faint object when discovered, and growing fainter as it receded from

both the sun and earth, observations were obtained as late as the end of April.

Comet 1887 I, known as the "Great Southern Comet," was detected by Dr. Thome, Director of the Cordoba Observatory in South America, on Jan. 18, 1887. On the same evening it was seen at a village near Cape Town, South Africa, and a day or two later at several places in Australia, but it does not seem to have become visible in the northern hemisphere. Dr. Thome describes the comet as a beautiful sight to the naked eye—a narrow, straight, sharply-defined, graceful tail, over 40° long, shining with a soft, starry light against the dark sky; beginning apparently without a head, and gradually widening and fading as it extended upward. Unfortunately, neither a well-defined nucleus nor even the slightest condensation upon which to point could be made out at any of the observatories where the comet was visible, and we are thus without means of determining the orbit with any degree of precision. In its physical appearance the new comet bore a considerable resemblance to the great comets of 1843, 1880, and 1882, and it certainly passed within a few thousand miles of the sun's surface.

Comet 1887 II was discovered by W. R. Brooks, of Phelps, N. Y., on the evening of Jan. 23, 1887, in the constellation Draco. It increased gradually in brightness till about the middle of February, when it was described as a bright telescopic object, about 3' in diameter, with well-marked central condensation of the tenth magnitude. The last observation published was made at Geneva on April 20.

Comet 1887 III was discovered by Mr. Barnard on the night of February 16, a very faint nebulous object with a rapid motion toward the north and west. In physical appearance it presented no marked variation from the ordinary telescopic comet during the four or five weeks it was under observation.

Comet 1887 IV. A third comet was discovered by Mr. Barnard on the night of May 12, its position then

being R. A. = $15^{\text{h}} 11^{\text{m}}$; decl. = $-30^{\circ} 36'$. On May 13 it was described by Prof. Boss as having a starlike nucleus of the 11.5 magnitude; it increased somewhat in brightness till about the middle of June, without, however, changing its general appearance. Mr. Chandler has combined all the observations at present available into four normal places, and finds that they are rather more satisfactorily represented by an ellipse than by a parabola.

Comet 1887 V is Olbers's periodic comet, rediscovered by Mr. Brooks on Aug. 24, 1887. This comet was originally discovered by Olbers at Bremen, on March 6, 1815, and in 1816 Bessel predicted that it would return to perihelion about Feb. 9, 1887. In 1881 Dr. Ginzell, of Vienna, published an elaborate rediscussion of the orbit, using 346 observations from 14 observatories, and taking account of perturbations. He obtained a period of about 74 years, with an uncertainty of 1.6 years, and gave Dec. 16, 1886, as the most probable date of perihelion passage. An extensive sweeping ephemeris was prepared by him, and for months a search for the comet was kept up by several astronomers, resulting in its discovery by

Mr. Brooks, who was also the first to detect Pons's comet at its return in 1883-84. Especial interest attaches to Olbers's comet as the third member of the group of comets having a period of about 75 years (Halley's, Pons's, and Olbers's) which has returned to perihelion in conformity with prediction. Early in September the comet showed some slight traces of a tail, in spite of its considerable distance from the earth. The nucleus was quite well defined, its brightness being from the eighth to the tenth magnitude.

Dr. Krueger's corrected orbit of the comet discovered by Mr. Finlay on Sept. 26, 1886 (1886 VII), shows that it can no longer be regarded as identical with De Vico's lost comet of 1844. However, Finlay's comet is moving in an ellipse whose period is about 6.7 years, and as it passed its perihelion on Nov. 23, 1886, another return will be due in the summer of 1893.

The approximate elements of the new comets are as follows, the dates being in Greenwich mean time:

Designation.	Perihelion passage T.	Q	ω	δ	q	Discovery.	Synonym.
1886, VIII.	1886, Nov., 28-29	259° 19'	81° 58'	65° 65'	1.430	1887, Jan. 23, by Barnard.	1887 c
1887, I....	1887, Jan., 11-41	339 59	64 40	188 9	0.005	1887, Jan. 18, by Thome...	1887 a
II....	1887, Mar., 17-08	279 51	159 11	104 17	1.638	1887, Jan. 22, by Brooks...	1887 b
III....	1887, Mar., 28-45	185 37	35 36	189 47	1.007	1887, Feb. 14, by Barnard.	1887 d
IV....	1887, June, 16-66	245 18	15 8	17 38	1.894	1887, May 12, by Barnard.	1887 e
V....	1887, Oct., 8-50	84 31	65 17	44 34	1.200	1887, Aug. 24, by Brooks...	1887 f

Periodic.
Olbers.

Prof. Daniel Kirkwood has suggested the probability that certain comets of short period may have originated within the solar system. For example: before its last near approach to Jupiter, Wolf's comet, 1884 III, had an eccentricity of 0.28, which is exceeded by twelve known asteroids, and a period of revolution of 3,619 days, or five sixths that of Jupiter. It was then an asteroid too distant to be seen even at perihelion. Again: the orbit of Tempel's comet, 1867 II, lies between Mars and Jupiter, and its elements do not differ greatly from those of an eccentric asteroid.

Dr. Bredichin has made a study of Fabry's comet, and of Barnard's two comets of 1886, with respect to their bearing upon his new theory of comets' tails. The tail of Fabry's comet belongs undoubtedly to type II, and the principal tail of Barnard's first comet (1886 II) to the same type. The secondary tail of this comet, noticed by Backhouse, seems to have been merely an elongation of the head, a phenomenon observed in other comets. Barnard's second comet (1886 IX) had two tails distinctly visible for a month, which belonged respectively to types I and III, and after passing perihelion it furnished further confirmation of Bredichin's theory by throwing out a third tail belonging to type II.

Stellar Photometry.—From a comparison of the star-magnitudes of the Oxford Uranometry with those of Wolff's second catalogue, and with those of the Harvard Photometry, Prof. Pickering has found that the Oxford magnitudes are, on the average, less than the Harvard magnitudes for stars down to the third magnitude, but greater for the fourth and fifth, and less again for stars below the sixth. The Harvard catalogue differs less from those of Wolff and Pritchard than the two latter do from each

other. The "wedge photometer," constructed under the direction of Prof. Pritchard for Prof. Pickering, has been submitted to a careful examination by Profs. Langley, Young, and Pickering, and it appears from Prof. Langley's observations of the wedge by means of his bolometer, that there is a selective absorption of light throughout the wedge; feeble in the more luminous portion of the spectrum, but of such a character that, broadly speaking, the transmissibility always increases from the violet toward the red, increasing very greatly in the infra-red. These results have been confirmed by Prof. Pickering's experiments, and they emphasize the danger, already recognized by Prof. Pritchard, of employing an instrument of this kind in the observation of deeply-colored stars.

The magnitudes of the standard stars of the British, French, German, Spanish, and American nautical almanacs, have been rediscussed by Prof. Pickering, and his results will probably be adopted in future issues of the French, Spanish, and American works. The plan proposed was, that the magnitude adopted for each star should be the mean of those derived from the Harvard photometry, the photometric observations of Wolff, the Uranometria Oxoniensis, and the Uranometria Argentina. The list published by Prof. Pickering embraces 800 stars, and of these the magnitudes of all but 64 depend upon at least two and generally upon three authorities; 182 stars being common to all four of the adopted standard catalogues of brightness.

Variable Stars.—Several new variable stars have been detected by Chandler, Sawyer, Espin, and others, and among them are two of more than ordinary interest, as they apparently belong to the well-known "Algol" type.

The first was discovered by Mr. Chandler in the constellation Cygnus, R. A. = $20^{\circ} 47' 5''$, decl. = $+34^{\circ} 14'$ (D.M. + 34° , 4181). Its light varies from 7.1 magnitude to about 7.9 magnitude, and the period is some aliquot part of 5.997 days, which can not be exactly determined until further observations are obtained. The second star referred to was discovered by Mr. E. F. Sawyer, in March, 1887, in the constellation Canis Major, and as it is the first undoubted variable found in that constellation, it will probably be known as R Canis Majoris. Its position for 1887 is R. A. = $7^{\circ} 14' 4''$; decl. = $-16^{\circ} 11'$. The minimum observed by Mr. Sawyer was 6.8 magnitude, and the period is probably about twenty-seven hours.

The new variable discovered by Mr. Gore on Dec. 13, 1885, has continued to receive careful attention at the hands of several observers. From a series of observations with the Zöllner photometer of the Potsdam Observatory, Dr. Müller found that the star attained its maximum (6.20 magnitude) on Dec. 12, 1886, which would give it a period of 864 days. In substantial agreement with this result is Mr. Sawyer's maximum of the 6.6 magnitude, observed on Dec. 13, 1886.

For the past four years the observatory of Harvard College has published an annual statement of the number of observations made during the previous year upon each variable star. In the fifth of these publications, to appear during 1888, Prof. Pickering proposes to give a statement of the number of dates of observation of each variable star during each year since its discovery, and he requests all who are interested in this department of astronomy to co-operate by contributing any information that will assist him in making this index as complete as possible.

Double and Binary Stars.—The following table contains the results of computations of the orbits of binary stars. The star δ Equulei is of especial interest, as the period of eleven years and a half assigned to it is the shortest known. Wrublewsky's orbit gives for 1887.24, position angle = $204^{\circ} 9'$; distance = $0.48''$. Further observations are very desirable:

STAR.	δ Equul.	Σ 1787.	Σ 948.	14 (1) Orion.
Time of periastron T	1892.08	1791.98	1716.0	1959.05
Position of node Q.	$24^{\circ} 05'$	$87^{\circ} 36'$	$166^{\circ} 30'$	$99^{\circ} 35'$
Position of periastron A.	$26^{\circ} 61'$	$185^{\circ} 23'$	$98^{\circ} 36'$	$802^{\circ} 42'$
Inclination i .	$81^{\circ} 75'$	$40^{\circ} 56'$	$46^{\circ} 8'$	$44^{\circ} 57'$
Eccentricity e .	0.2011	0.4498	0.229	0.2465
Semi-axis major a .	$0.408''$	$2.05''$	$1.64''$	$1.22''$
Mean motion μ .	$+1.80''$	$-0.741''$	485.8	$-1.89''$
Period in years P.	11.473	276.92	485.8	190.48
Computer	Wrublewsky	Gore.	Gore.	Gore.

Prof. G. W. Hough, of the Dearborn Observatory, Chicago, has published a valuable catalogue of 209 new double stars discovered and measured by himself, with the 18 $\frac{1}{2}$ -inch Clark refractor of that institution.

A short list of thirteen new double stars, discovered by Messrs. Leavenworth and Muller

with the 26-inch McCormick refractor, is published in No. 156 of the "Astronomical Journal."

Pleiades.—The details of Dr. Elkin's determination of the relative positions of the principal stars in the Pleiades have been published as Part I of the first volume of "Transactions" of the Astronomical Observatory of Yale University. This is, we believe, the first heliometer-work done in this country. Dr. Elkin has included all the stars in the "Durchmusterung" down to the 9.2 magnitude, which may reasonably be said to fall within the group. One of the stars used by Bessel in his celebrated work with the Königsberg heliometer was omitted on account of its faintness, but Dr. Elkin has added seventeen stars to Bessel's list of fifty-three, so that he has taken sixty-nine stars in all.

With the filar micrometer of the Washington 26-inch telescope, Prof. Hall has measured the positions of sixty-three small stars in the Pleiades relatively to the brighter stars determined by Bessel and Elkin; thus furnishing data for testing in the future whether or not there is any proper motion of the brighter stars relatively to the fainter ones.

Star-Catalogues.—Argelander's "Durchmusterung," or survey of the northern heavens, has been extended from 2° south declination to 23° south declination, by Dr. Schönfeld, who has recently published his results as volume viii of the Bonn Observatory "Beobachtungen." This catalogue contains the places of 183,659 stars within the limits mentioned, together with an additional 1,173 stars falling beyond these limits, all referred to the epoch of Argelander's work, namely, 1855.0. In the atlas accompanying the volume each chart embraces one hour of right ascension, with an overlap of four minutes on either side, and 22° of declination, reaching from -1° to -23° . Dr. Thome, of Cordoba, is extending Schönfeld's work to the south pole, and has already gone over 10° of declination.

Among recent star-catalogues are Romberg's and Kam's compilations of the star-places scattered through the volumes of the "Astronomische Nachrichten," and Respighi's mean declinations of 1,004 naked-eye stars observed with the meridian circle of the Campidoglio Observatory during 1879, 1880, and 1881. An important list of 480 stars, to be used as fundamental points for zone observations between 20° and 80° south declination, is published by Dr. Anwers, in the June (1887) number of the "Monthly Notices of the Royal Astronomical Society."

Dr. C. H. F. Peters, Director of the Litchfield Observatory, Clinton, N. Y., has contributed two valuable papers to the third volume of the "Memoirs of the United States National Academy of Sciences." The first paper is a critical examination of all data bearing on Flamsteed's twenty-two "missing" stars, and in every case Dr. Peters has formulated a plausible explanation of the supposed disap-

pearance of the star from the heavens. The second paper is a list of corrigenda to various star-catalogues.

Dr. Swift has published in the "Astronomische Nachrichten" his sixth catalogue of nebulae, discovered at the Warner Observatory, Rochester, N. Y.

Astronomical Prizes.—The Lalande prize of the Paris Academy has been awarded to Dr. Backlund for his investigations on the motion of Encke's comet; the Valz prize to M. Bigourdan, chiefly for his inquiries into the effect of personality in the observation of double stars; and the Damoiseau prize to M. Souillart, for his revision of the theory of Jupiter's satellites. An *encouragement* of 1,000 francs from the Damoiseau fund has also been decreed to M. Obrecht. The gold medal of the Royal Astronomical Society has been awarded to Mr. G. W. Hill for his researches on the lunar theory. The Watson gold medal of the United States National Academy of Sciences and an *honorary* of \$100 were conferred on Dr. Gould at the spring meeting of the Academy in 1887, and the gold and silver medals of the American Academy, of Boston, were presented to Prof. Langley on May 11, 1887. The Warner prizes of \$100 for each new comet discovered have been awarded to Messrs. Barnard and Brooks, the former having detected three and the latter two comets, including that of Olbers. On account of the importance of early observations of the latter comet, and the uncertainty existing in the computed period, a special prize had been offered for its detection.

Bibliography.—Among the recent books worthy of mention are: Houzeau and Lancaster's "Bibliographie générale de l'Astronomie," vol. i, Part I; Oppolzer's "Canon der Finsternisse"; and Schram's "Tafeln zur Berechnung der näheren Umstände der Sonnenfinsternisse"; Airy's "Numerical Lunar Theory"; Lockyer's "Chemistry of the Sun"; Braun's "Cosmogonie"; and also the second editions of Miss Clerke's "History of Astronomy during the Nineteenth Century"; and of Lancaster's "Liste générale des Observatoires et des Astronomes." We are glad to notice the reappearance of the "Astronomical Journal," which was started by Dr. Gould at Cambridge in 1849. The sixth volume was completed in 1861, and, after an intermission of twenty-five years, the first number of the seventh volume is dated Nov. 2, 1886.

AUSTRALASIA, a division of the globe, of which the chief inhabited portions are the British colonies of the Australian continent and the islands of New Zealand and Tasmania. The colonies of New South Wales, Victoria, Queensland, South Australia, Tasmania, and New Zealand possess responsible government. Western Australia has a representative system that is more under the control of the crown; and the Fiji and Rotumah islands, the Kermadec islands, and the Auckland islands, with the Carolines and many small islands, constitute crown colonies. The total

area of British Australasia is 3,268,866 square miles, with a population of 3,625,809 souls.

Naval Defense.—Most of the colonies have acquiesced, fully or in part, in the recommendations of the British Admiralty for co-operation in the naval defenses that were submitted to the Colonial Conference held in London early in 1887. The Admiralty adopted Admiral Tryon's suggestion of fast cruisers, but instead of favoring the "Scout" class, recommended the "Archer" class. These have a displacement of 1,680 tons, will steam 17 knots an hour, and carry six 6-inch breech-loading rifled guns, besides a torpedo armament. It is proposed to secure five of these and two fast torpedo-boats having a displacement of 480 tons, steaming 19 knots, and armed with three tubes for Whitehead torpedoes, one 8-inch breech-loading gun, four quick-firing 8-pounders, and two machine-guns. This fleet will be auxiliary to the vessels possessed by the separate colonies, and to the Australian squadron of the British navy.

New South Wales.—The Legislature consists of two branches, the Legislative Council and the Assembly, the former of which is composed of not less than 22 members, nominated by the Crown, and the latter of 122 members, elected by manhood suffrage and secret ballot. The Governor, who is appointed by the Crown, is Lord Carrington, who assumed office on Dec. 12, 1885. The Ministry, appointed on Jan. 19, 1887, consists of the following members: Premier and Colonial Secretary, Sir Henry Parkes; Colonial Treasurer, John Fitzgerald Burns; Minister for Lands, Thomas Garrett; Minister for Public Works, John Sutherland; Attorney-General, W. J. Foster; Minister for Public Instruction, James Inglis; Minister for Justice, William Clarke; Postmaster-General, C. J. Roberts; Minister of Mines, Francis Abigail. The area of the colony is 810,700 square miles. The estimated population in 1885 was 957,985. The average net immigration during the five years 1880-'85, was 80,000 per annum. In 1885 the number of immigrants was 78,188, and of emigrants 80,455. The births in 1885 numbered 85,043, the deaths 15,282, and the marriages 7,618. The population comprised 662,635 Protestants, of whom 425,888 belonged to the Church of England, 92,542 to the Presbyterian, and 82,195 to the Methodist Church; 264,692 Roman Catholics; 4,215 Jews; 11,882 Pagans; and 18,776 of various beliefs. The state schools in 1885 had 181,578 scholars and 3,552 teachers. Sydney, the capital, contained at the end of 1886 about 280,000 inhabitants.

The value of imports in 1885, including specie and bullion, was £23,295,232; the value of exports, £16,541,745. The export of wool was valued at £7,678,247. The quantity of wool sent to Great Britain was 110,106,216 pounds, of the value of £4,958,759. The number of sheep in the colony in March, 1886, was 84,551,662. The area leased for pastoral purposes in 1885 was 217,407 square miles. The area under cultivation was only 868,098 acres, pro-

ducing besides other crops 2,768,880 bushels of wheat, 4,285,168 bushels of Indian corn, 41,859,860 pounds of sugar, and 555,470 gallons of wine. The next most important exports after wool were coal of the value of £966,668, and tin of the value of £728,969. The gold product in 1885 was £366,888.

The length of the state railroads in 1885 was 1,732 miles. Their capital cost was £24,962,972, the earnings for the year £2,174,868, and the expenses £1,458,158. There were 19,864 miles of telegraph-wires. The number of paid messages was 2,625,992. The post-office transmitted 39,351,200 letters.

The public revenue in 1885 was £7,588,656; the expenditure, £7,544,594; the debt on Dec. 31, 1886, £41,064,259.

In the beginning of 1887 a difference on financial questions arose in the Cabinet, and the Premier, Sir Patrick Jennings, taking exceptions to certain statements of the colonial secretary, G. R. Dibbs, in connection with the deficit of 1880, requested the latter to resign. On his refusing, the entire ministry tendered their resignations on January 10. After several conferences with the Governor, a new ministry was formed under Sir Henry Parke, who, in explaining his policy to the Legislative Assembly, announced that the Government would revert to the principle of pure free trade, and undertake a thorough reformation of the disorganized finances of the colony, stating that they would endeavor to obtain a larger revenue from lands, better management of the railroads, retrenchment in the civil service, and, if necessary, would resort to an equitable property tax. With this programme they appealed to the electorate, and obtained a working majority in a new parliament. In the financial statement the colonial treasurer proposed the repeal of the customs act of the last session, and announced a new tariff limited to twenty-four articles selected for revenue purposes only, including higher rates on spirits and an excise duty on domestic ales. With no other new taxes, the ministry expected an increased revenue, which, with the aid of savings, would enable them to extinguish the accumulated deficits, amounting to £2,600,000, within eight years. The estimates showed a reduction of £450,000 on the appropriations of 1886, and the ministry expected a surplus of £800,000 at the end of the year. There were some stormy sittings during the debates, and on May 21 a continuous session of forty-eight hours was ended by the application of the *clôture*. A bill was passed for protecting the colony from the influx of foreign criminals whose sentences have expired, containing, among other stringent provisions, one making persons who harbor such criminals liable to a year's imprisonment, and empowering the Governor to proclaim foreign penal settlements. Vessels bringing time-expired convicts are liable to forfeiture, and their captains to a sentence of five years in the penitentiary.

Victoria.—The legislative power is vested in

the Legislative Council, composed of eighty-six members, elected under property and educational limitations, and the Legislative Assembly, elected by universal suffrage. The Governor is Sir Henry Brougham Loch, who assumed the government on July 15, 1884. The Cabinet is made up as follows: Premier, Minister of Mines and of Railways, Sir Duncan Gillies; Chief Secretary and Commissioner of Water-Supply, Alfred Deakin; Attorney-General, H. J. Wrixon; Commissioner of Public Works, J. Nimmo; Minister of Justice, Henry Outhbert; Commissioner of Trade and Customs, W. F. Walker; Commissioner of Lands and Survey, J. L. Dow; Minister of Public Instruction, Charles H. Pearson; Minister of Defense, James Lorimer; Postmaster-General, F. T. Derham; Ministers without office, M. H. Davies and James Bell.

The area of Victoria is 87,884 square miles. The population was estimated on June 30, 1886, at 1,009,753, comprising 541,015 males and 468,738 females. The number of births in 1885 was 29,975; of deaths, 14,860; of marriages, 7,395. The capital city, Melbourne, had in 1886 about 865,000 inhabitants. The population was divided in respect to religion in 1885 into 852,087 Episcopalians, 149,849 Presbyterians, 122,504 Methodists, 74,689 other Protestants, 229,917 Roman Catholics, 4,894 Jews, 11,000 Pagans, and 30,100 others. There were in 1885 1,826 state schools, with 224,685 enrolled pupils, and 3,650 teachers. The immigration by sea in 1885 was 76,976, and the emigration 61,994.

The total value of the imports in 1885 was £18,044,604, and of the exports, £15,551,758. The export of wool was valued at £5,028,011; of gold and specie, £4,809,585; of live-stock, £900,801; of breadstuffs, £772,482. Of the wool export, amounting to 106,078,932 lbs., only about one half was the produce of the colony. The quantity of gold produced in 1885 was 785,218 ounces, valued at £2,940,872. There were 2,405,157 acres in cultivation in March, 1886, of which 215,994 were under wheat. The wheat-product was 9,170,588 bushels, or 9 bushels to the acre. The number of sheep in the colony was 10,681,887 in 1886; of cattle, 1,290,790 head.

The government railroad system had in June, 1886, a total length of 1,743 miles, besides 267 miles in process of construction. There were 3,949 miles of telegraph lines and 9,617 miles of wire at the close of 1885. The gross railway receipts in 1885-'86 were £2,329,126, and the net receipts £1,018,589, being a profit of 4.36 per cent. on the capital investment of £28,880,000, all but £2,400,000 of which was raised by loans. The number of letters forwarded in 1885 was 36,061,880; of telegraph dispatches in 1884, 1,594,296. The revenue from telegraphs in 1885 was £87,802. A parcel post was introduced in 1887.

The receipts of the treasury in the year ended June 30, 1886, were £6,416,405; the

expenditures, £6,605,901. Of the revenue £2,683,510 came from taxes, and the rest from the railroads, telegraphs, crown lands, and similar sources. The expenses of the public debt amounted to £1,285,904, and £1,418,690 were expended on railways, £968,284 on other public works, and £549,671 on posts and telegraphs. The expenditure for public education amounted to £642,070. The public debt at the end of 1885-'86 amounted to £30,127,382. The average rate of interest paid is 4½ per cent. The revenue for 1886-'87 amounted to £6,733,000; that for 1887-'88 is estimated at £6,906,000, and the expenditure at £7,444,000. The receipts are to be increased by a duty of 8s. 6d. per cwt. on cane-sugar, and 6s. on beet-sugar, and by increased timber duties.

A centennial exhibition is arranged to be held in Melbourne, to begin on August 1, 1888, and remain open six months.

South Australia.—The Legislative Council, elected by limited suffrage, can not be dissolved by the executive. Each of the fifty-two members is elected by the entire colony, but the seats are apportioned among four districts.

The House of Assembly consists of fifty-two members, elected by universal manhood suffrage. The Governor, who received his appointment in November, 1882, is Sir William O. F. Robinson. The House of Assembly passed a vote of want of confidence in the government on June 8, 1887, and a new Cabinet was formed, composed as follows: T. Playford, Premier and Treasurer; James Gordon Ramsay, Chief Secretary; A. Cott, Commissioner of Public Works; O. C. Kingston, Attorney-General; and Mr. Johnson, Commissioner of Education.

The area of the colony is 908,425 square miles. The estimated population on Dec. 31, 1885, was 313,423 persons, of whom 163,641 were males and 149,782 females.

The value of imports in 1885 was £5,548,403; of exports, £5,686,255. The leading articles of export are wool, of the value of £1,417,245 in 1885; and wheat and flour, of the value of £2,162,513. The area of cultivated land is 2,785,490 acres, of which 1,942,453 are devoted to wheat, producing 14,621,755 bushels in 1884-'85. There are 226,130 square miles held under pastoral leases. The number of sheep in the colony in 1885 was 6,696,406.

The railroad mileage in 1885 was 1,063 miles of completed lines and 718 under construction. There were 1,063 miles of telegraph lines and 9,378 miles of wire.

The revenue for the year ended June 30, 1886, was £2,279,038; the expenditure, £2,383,289. The revenue for 1886-'87 was estimated at £2,218,124, and the expenditure at £2,214,563. The actual receipts, however, only amounted to £1,868,000, leaving an accumulated deficiency of £1,080,000. The public debt amounted to £17,020,900 on Dec. 31, 1885. The entire amount was raised for productive public works.

Queensland.—The members of the Legislative Council are nominated by the Crown for life, and those of the Legislative Assembly elected by the people without restriction of suffrage, holders of real estate having votes in the districts where their property is situated as well as in their places of residence. The Governor is Sir Anthony Musgrave, who was appointed in April, 1888. The ministry consists of the following members: Sir Samuel Walker Griffith, Premier, Chief Secretary, and Vice-President of the Executive Council; James Robert Dickson, Colonial Treasurer; Thomas MacDonald-Patterson, Postmaster-General; Arthur Rutledge, Attorney-General; William Miles, Secretary for Public Works; Berkeley Basil Moreton, Colonial Secretary and Secretary for Public Instruction; Charles Boydell Dutton, Secretary for Public Lands.

The colony has an area of 668,497 square miles and an estimated population on June 30, 1886, of 330,090 souls. The number of immigrants in 1885 was 84,884, including 679 Chinese and 1,929 Polynesians. The emigration was 22,768, including 1,288 Chinese and 1,908 Polynesians. The Chinese immigration in 1883 was 2,951, and the decline is caused by restrictive legislation. The number of births in 1885 was 11,672; of deaths, 6,235; of marriages, 2,842.

Of the total area of the colony, 7,728,568 acres, or less than 2 per cent., had been alienated by the Government up to the end of 1885. There were 307,290,880 acres leased for pastoral purposes in 1885, the number of runs being 9,292. The number of sheep in the colony was 8,994,322. Under the new land act of 1884 agricultural leases for not more than 1,280 acres will be granted for fifty years, and pastoral leases for a maximum of 20,000 acres to run thirty years.

The total value of imports in 1885 was £6,422,490; the value of exports, £5,248,404. The export of wool was valued at £1,779,682; of sugar, £720,921. The area devoted to the cultivation of sugar-cane in 1885 was 59,186 acres. The produce of 38,557 acres was valued at £1,075,235. The quantity of gold produced in 1885 was 310,941 ounces.

At the end of 1885 there were 1,434 miles of railroad, in which the Government had invested £9,484,654. There were 558 miles more in course of construction. The railroad receipts during 1885 amounted to £691,541, and the working expenses to £444,140. The number of letters sent through the post-office in 1885 was 9,776,407. The mileage of telegraph lines was 7,533 at the end of 1885; of wires, 12,290. The number of messages during the year was 1,082,183.

The revenue of the Government during 1885-'86 was £2,868,295; the expenditure, £3,090,160. The revenue for 1886-'87 was £2,870,000; the expenditure, £3,263,000. The public debt on Dec. 31, 1885, amounted to £19,320,850.

Western Australia.—The Governor is assisted by a Legislative Council, composed of eight nominated and sixteen elected members. The present Governor is Sir Frederick Napier Broome, appointed in December, 1882.

The area of the colony is estimated at 975,920 square miles. The population at the end of 1885 was estimated at 35,186. The net immigration during the year was 2,223; the number of births, 1,200; the number of deaths, 600. The value of imports in 1885 was £650,391; of exports, £446,692. There were 2,288 miles of telegraph and 76 of completed railroad, while 48 miles of railroad were building.

Tasmania.—The Legislative Council has 18 members, and the House of Assembly 36, all elected under property qualifications of different degrees for each house.

The Governor is Sir Robert G. O. Hamilton, appointed in January, 1887. The Cabinet resigned in March, 1887, and a new one was formed, composed of the following ministers: Premier and Chief Secretary, P. O. Fysh, who succeeded James W. Agnew; Treasurer, Mr. Bird, who succeeded William H. Burgess; Attorney-General, Mr. Clarke, successor to John S. Dodds; Minister of Lands, Mines, and Works, Mr. Braddon, successor to Nicholas J. Brown.

The area of the colony is estimated at 26,215 square miles. The population on Dec. 31, 1885, was estimated at 133,791 souls. The net immigration for the year was 649.

The imports in 1885 amounted to £1,757,486; the exports to £1,813,693. The chief articles of export are wool, gold, tin, timber, and preserved fruits. The revenue of the Government in 1885 amounted to £600,550, and the expenditure to £603,657.

New Zealand.—The Legislative Council is composed of 54 members, nominated for life by the Crown; the House of Representatives, of 95 members, elected by restricted suffrage for three years.

The Governor is Lieut.-Gen. Sir William Francis Jervois, appointed in November, 1882, in March, 1887.

The ministry is composed of the following members: Sir Julius Vogel, Colonial Treasurer, Postmaster-General, Commissioner of Telegraphs, and Commissioner of Stamp Duties and Customs; Sir Robert Stout, Premier, Attorney-General, and Minister of Education; Edward Richardson, Minister of Public Works; John Ballance, Native Minister, Minister of Defense, and Minister of Lands and Immigration; Joseph Augustus Toke, Minister of Justice; Patrick Alphonsus Buckley, Colonial Secretary; William J. M. Larnach, Minister of Mines and Minister of Marine; W. H. Reynolds, without office.

The area of New Zealand is estimated at 104,027 square miles. The North Island contains 44,736, the Middle Island 55,224, and Stewart's Island 1,300 square miles. The pop-

ulation in 1886, according to a census taken on March 28 was, exclusive of aborigines, 578,482, of which number 312,221 were males, and 266,261 females. The number of births was 19,693 in 1885; of deaths, 6,081; of marriages, 3,813. The number of immigrants was 16,199; of emigrants, 11,695. The Maori population in March, 1886, was 41,432, of which number 22,765 were males and 18,667 females. The number of Maoris in 1881 was 44,097.

The chief industries of the colony are agriculture, stock-raising, and gold-mining. Two thirds of the surface of the islands is fitted for agriculture or grazing. The total area of the colony is 66,710,320 acres, of which 18,805,594 had passed into the hands of private owners up to the close of 1885. The cultivated acreage in 1886 was 6,668,920, but of this 5,465,157 acres were under grass-crops. The production of wheat in 1886 was 4,242,285 bushels. The average yield of wheat per acre is 24.40 bushels; of oats, 26.11; of barley, 25.92. The number of sheep in the colony in March, 1886, was 16,580,388. The product of the gold-mines in 1885 was 222,732 ounces, valued at £890,056.

The total value of the imports in 1885 was £7,479,921; of the exports, £6,819,939. The export of wool was 86,507,431 pounds, valued at £3,205,275. Grain and flour were exported to the value of £627,865, and frozen meat of the value of £373,857. The value of the gold exported was £890,056.

On March 31, 1885, there were 1,654 miles of railroads in the colony. The capital investment up to March 31, 1886, amounted to £18,726,166. The net receipts for the year were £857,078, representing a profit of not quite 2½ per cent. The post-office in 1885 forwarded 37,149,788 letters and 14,233,878 newspapers. There were, on Jan. 1, 1886, 4,463 miles of telegraph lines and 10,931 miles of wire.

The revenue for the year ended March 31, 1886, was £3,746,945, of which £181,833 were derived from land sales, leases, and mining licenses. The public debt in March, 1886, amounted to £34,965,222, in part offset by a sinking fund amounting to £3,276,873. The revenue for 1886-'87 was £3,882,428, and the expenditure £4,012,598. To secure an equilibrium the Government proposed to increase the property tax to 1d. in the pound for all properties exceeding £2,500 in value. The ministry was defeated on a resolution declaring the budget unsatisfactory, and Parliament was dissolved in June, 1887, and new elections were appointed for August. Before the prorogation a bill was passed providing for the self-adjustment of parliamentary representation on the basis of population.

British New Guinea.—Great excitement was caused in Queensland by the massacre of Capt. Craig and the "Emily," while pearl-fishing off Jeannet Island, New Guinea, in October, 1886. In the winter the British naval vessel "Diamond" was sent to punish the natives. They

fled at the approach of the ship, but several of their villages were burned.

AUSTRIA-HUNGARY, an empire in Central Europe. The two states of which it is composed are united in the person of their sovereign, and have a common army, navy, and diplomacy. They are also joined in a customs-union, which with the fiscal arrangements for the defrayal of common expenses, is renewable every ten years. Appropriations for common purposes are obtained from the Delegations, a body of 120 members chosen one half from the Austrian and one half from the Hungarian Parliament, each upper house sending 20 and each lower house 40. The sovereignty in the Austrian or Cisleithan Empire, and in the Hungarian or Transleithan Kingdom is hereditary in the House of Hapsburg. The Emperor is Franz Josef I, born Aug. 18, 1830, who ascended the throne in 1848. The heir-apparent is the Archduke Rudolf, born Aug. 21, 1858. The Ministry for Common Affairs is composed as follows: Minister for Foreign Affairs and of the Imperial Household, Count G. Kálnoky de Köröspatak; Minister of War, Lieut. Field-Marshal Count Bylandt-Rheydt; Minister of Finance, Benjamin de Kállay.

Area and Population.—The area of the principal political divisions of the Austrian and Hungarian monarchies, and their estimated population at the end of 1885, are given in the following table:

PROVINCES.	Square miles.	Population.
EMPIRE OF AUSTRIA:		
Lower Austria	7,654	2,468,898
Upper Austria	4,681	767,779
Salzburg	2,767	104,925
Styria	8,670	1,341,651
Carinthia	4,005	338,435
Carniola	3,856	491,563
Coast Provinces	3,054	666,534
Tyrol and Vorarlberg	11,324	910,966
Bohemia	20,060	5,097,838
Moravia	8,558	2,187,475
Silesia	1,957	581,977
Galicia	30,807	6,219,680
Bukovina	4,065	610,885
Dalmatia	4,940	508,695
Total Austria	115,908	22,863,895
KINGDOM OF HUNGARY:		
Hungary and Transylvania	108,258	14,841,276
Croatia and Slavonia	16,778	1,992,674
Town of Fiume	8	21,736
Total Hungary	125,039	16,855,686
Total Austro-Hungarian Empire	240,942	39,719,581

The number of births in Austria in 1885 was returned as 885,201; deaths, 714,081; marriages, 175,233; excess of births over deaths, 171,170. The number of births in Hungary in 1884 was 758,652; deaths, 515,254; marriages, 167,404; natural increment of population, 238,898. The number of emigrants through the German free ports in 1885, was: Austrians, 20,558; Hungarians, 13,195. The population of Vienna, the Austrian capital, in 1880, was

1,108,857; that of Buda-Pesth, the capital of Hungary, in 1886, 422,557.

The Roman Catholics form 79·9 per cent. of the population of Austria proper; the Greek and Armenian Catholics, 11·5 per cent.; Protestants and other Christians, 1·8 per cent.; Byzantine Greeks, 2·3 per cent.; Jews, 4·5 per cent. In Hungary the proportions are 50 per cent. Roman Catholics, 9·7 per cent. Greek Catholics and Armenians, 20·6 per cent. Protestants, 15·6 per cent. Byzantine Greeks, and 4·1 per cent. Jews. In the whole empire 67·6 per cent. of the population are Roman Catholics, 10·6 per cent. Greek and Armenian Catholics, 9·6 per cent. Protestants, 7·9 per cent. of the Byzantine Greek Church, and 4·3 per cent. Jews. According to statistics 1880, the total illiterate class formed 32·59 per cent. of the male and 36·08 per cent. of the female population of Austria over six years of age. In the lands of the Hungarian Crown 81·6 per cent. of the population could neither read nor write. In 1883, 84·9 per cent. of the children of school-age were receiving instruction in Austria, while in Hungary 85·8 per cent. were attending school in 1885.

Finance.—The revenue in 1886 for common affairs amounted to 119,724,748 florins. The budget estimates for 1887 amounted to 123,855,414 florins, of which 102,055,440 florins were to be provided by the contributions from the two parts of the empire, 18,642,206 florins derived from customs, and the rest from the receipts of the ministries. The total expenditure for the diplomatic service was set down as 4,477,150 florins; the ordinary expenditure for the army as 99,950,528, and the extraordinary as 5,984,850 florins; the ordinary expenditure of the navy as 9,145,009, extraordinary as 2,171,030 and expenses of the Board of Control as 128,867 florins.

The Army.—The army law of 1866 created in addition to the Landwehr a Landsturm, or second line of reserves. The annual recruit of the regular army amounts to 94,000. The term of service in the active army is three years, in the regular army reserve four years, in the Landwehr five years, and in the Landsturm twelve years. Men who have served in the regular army are liable for service in the Landsturm as commissioned or non-commissioned officers up to the age of sixty. In time of war the Landsturm may be drawn on to complete the Landwehr regiments. The Landsturm is expected to add a million men to the war-effective, which will nearly double the numerical strength of the Austro-Hungarian army. Three army corps are to be provided with the new repeating-rifle by the beginning, and seven more before the end of 1888. The armament of the Landwehr is to be completed by 1891.

The common ministry, impelled by the precarious political situation in Europe, called an extraordinary session of the Delegations in the beginning of March, 1887, and obtained an extraordinary war credit of 52,500,000 florins.

Russia had concentrated a large force of cavalry on the frontier of Galicia, which caused a similar but less extensive movement of Austro-Hungarian troops, and hastened the carrying out of military measures already decided upon. Wooden barracks for cavalry were erected along the whole frontier of Galicia, and large numbers of workmen were employed in February and March in completing the fortress of Oracow, and on fortifications at Przemyśl.

The work on the strategic lines in Galicia was also pushed forward. The Austrian Reichsrath voted 12,011,655, and the Hungarian Diet 7,460,000 florins in February for the Landwehr and Landsturm, and arms were provided for the Austrian Landwehr and the Hungarian Honved, and uniforms purchased for the Landsturm of both countries. Following the example of France and Germany, the Austro-Hungarian Government prohibited the exportation of horses, making an exception in favor of Italy. The regulations for the organization of the Landsturm were not uniform in the two parts of the empire. In Austria every man below the age of forty-two, unless unfit even for ambulance service, and ex-officers up to the age of sixty are enrolled, while in Hungary those only are taken who have had military training, or are likely to make efficient soldiers. The Hungarian Government in order to satisfy the national craving for industrial independence of Austria granted valuable concessions to the firm of Nordenfeldt for the establishment of a factory for small-arms at Buda-Pesth, and contracted for a supply of 400,000 rifles within two years. Owing to the improved state of affairs in Bulgaria and Western Europe, the Imperial Government, after having spent 24,000,000 florins of the extraordinary appropriation, announced that they would require no more.

The Navy.—The Austro-Hungarian Government in 1886 possessed 10 armor-clad vessels of from 3,550 to 7,390 tons displacement, with armor ranging from 5 to 14 inches. Great attention has been paid to the torpedo-fleet. Three cruisers of 1,500 tons displacement, and capable of steaming 19 knots an hour, have recently been built. A new steel-plated turret-ship, the "Stéphanie," was launched at Trieste, April 14, 1887. The displacement is 5,100 tons, and the maximum thickness of the armor 9 inches.

Commerce.—The total value of the merchandise imports of the empire in 1885, including the annexed provinces but excluding Dalmatia, which lies outside of the imperial line of customs, was 557,948,324 florins, and the value of the exports 672,088,194 florins. The values of the leading articles of import were as follow: Vegetable fibers and manufactures, except cotton, 68,170,132 florins; silk and silk manufactures, 53,699,663 florins; clothing, etc., 27,452,800 florins; wool and woolen goods, 21,957,428 florins; cotton and manufactures thereof, 9,450,484 florins; vegetables and fruits, 48,465,-

518 florins; grain and pulse, 32,924,212 florins; sugar, coffee, etc., 27,586,642 florins; animals, 26,978,980 florins; fats and oils, 36,156,866 florins; furs, 16,551,260 florins; machinery and vehicles, 22,608,184 florins; wood and manufactures thereof, 15,937,841 florins; books and objects of art, 15,705,589 florins; gums and resins, 12,628,895 florins; salt, 12,788,321 florins; metals and metal manufactures, 11,839,271 florins; pottery, 8,945,570 florins; fuel, 7,700,788 florins; wines and spirits, 7,545,645 florins; minerals, 6,062,106 florins. The leading articles of export and their values for 1885 were as follow: Grain, flour, and pulse, 96,447,608 florins; fuel, 79,080,893 florins; sugar, 50,658,667 florins; instruments, watches, etc., 46,944,551 florins; wool and woolens, 40,004,984 florins; cattle, 35,666,612 florins; animal products, 31,300,839 florins; wines and spirits, 28,528,888 florins; leather and leather manufactures, 21,445,100 florins; glass and glass wares, 19,896,943 florins; vegetable fibers and manufactures thereof, 18,779,181 florins; cotton manufactures, 16,604,457 florins; minerals, 12,481,218 florins; paper and paper manufactures, 11,465,173 florins; iron and iron manufactures, 11,120,839 florins; tobacco, 8,167,673 florins.

The imports of specie and bullion in 1885 amounted to 12,282,529, and the exports to 8,727,579 florins. Of the merchandise imports 337,495,617 florins, and of the exports 317,319,252 florins passed over the German frontier, while 87,881,560 florins of imports and 95,002,077 florins of exports went through Trieste, and 31,748,124 florins of imports and 51,576,122 florins of exports through Fiume and the other sea-ports. The import trade with Roumania amounted to 40,047,688, and the export trade to 39,157,016 florins. The Russian imports were 21,390,116, and the exports to Russia 21,671,517 florins. The imports from Italy amounted to 19,176,409, from Servia to 14,162,174, from Switzerland to 5,477,370, and from Turkey and Montenegro to 569,316 florins, while the value of the exports to Italy was 47,638,326, to Servia 13,991,139, to Switzerland 29,570,127, and to Turkey and Montenegro 157,618 florins. High protective tariffs have caused a decline in the import trade, which were valued in 1884 at \$247,860,000, and in 1885 were only \$225,990,000, while for 1886 they were estimated at \$221,616,000. The Russian imports fell off most, but the decrease in those from Great Britain, Germany, and France were considerable. The customs dues have risen from 40 to 86 cents *per capita*, with a simultaneous increase in the consumption duties from 86 cents to \$1.60. The estimated value of the exports in 1886 is \$291,600,000.

Railroads and Telegraphs.—In January, 1886, the Austrian Government owned 2,299 miles of railroad and the joint-stock companies 6,023 miles, though of the latter 981 miles were operated by the state. The length of the Hungarian railroads in 1885 was 5,635 miles, of which

2,765 miles were operated by the Government. In 1885-'86 12,885,000 florins were appropriated for the construction of new lines in Austria.

The telegraph system of Austria in 1885 comprised 24,212 miles of lines and 62,447 miles of wires; that of Hungary, 10,872 miles of lines and 40,172 miles of wires. In Bosnia and Herzegovina there were 1,780 miles of lines. The number of dispatches in Austria in 1885 was 6,701,899, and in Hungary 8,686,880.

The Post-Office.—The Austrian post-office in 1885 transmitted 888,118,000 letters and postal-cards, 86,604,400 newspapers, 58,389,000 circulars and patterns, and 38,862,200 packages of goods. The receipts in 1884 were 20,020,780, and the expenses 16,478,780 florins. The extent of the postal traffic in Hungary was 120,651,740 letters and cards, 47,081,820 journals, 15,721,814 circulars, etc., and 10,502,302 parcels. The receipts of the Hungarian post-office in 1884 were 8,801,264, and the expenses 7,215,917 florins.

Shipping and Navigation.—The Austro-Hungarian merchant-marine in 1886 numbered 61 steamers of 69,452 tons, in the foreign trade; 82 coasting steamers, of 14,491 tons; and 9,225 sailing-vessels of all descriptions, of which the tonnage was 228,044. In 1884 there were 62,112 vessels, of 7,478,522 tons, entered; and 61,998 vessels, of 7,481,690 tons, cleared at Austro-Hungarian ports. Of the tonnage, 87 per cent. was Austrian.

The Occupied Provinces.—The provinces of Bosnia and Herzegovina were occupied by Austria-Hungary under the provisions of the treaty of Berlin, and have since been administered by imperial civil officials. The same instrument stipulated that the Austrian military should occupy the Sanjak of Novi-Bazar, but that the civil administration should continue to be Turkish. Bosnia has an area of 16,200 square miles, and contained 187,574 inhabitants in 1885. The area of Herzegovina is 3,540 square miles, and the population in 1885 was 1,148,517. Novi-Bazar, with an area of 8,522 square miles, had 168,000 inhabitants in 1879. The revenue of the occupied provinces for 1887 was estimated in the budget at 8,977,890, and the expenditure at 8,920,616 florins. The cost of the army of occupation was estimated at 5,119,000 florins.

Secret Treaty with Russia.—In April, 1887, the German Government, through the semi-official press, revealed the existence of a secret treaty in which Russia agreed to an annexation of Bosnia and Herzegovina, as the price of Austrian neutrality, long before the Russo-Turkish war. The disclosure, which was intended to refute complaints of Russian journals that Germany had supported Austrian policy in antagonism to Russia, was embarrassing to Austro-Hungarian statesmen, and especially so to Tisza, the Hungarian Premier, who resigned when the occupation of the provinces was resolved upon by the Imperial Government, because his country-

men, whose sympathies were with the Turks during the war, considered it a betrayal of Turkey. He withdrew his resignation, and obtained from Parliament the supplies for the occupation, but it was by representing Austria-Hungary's action as necessitated by the situation resulting from the war. The secret treaty was negotiated in 1876 during the meeting of the Austrian and Russian Emperors at Reichstadt, and was signed at Vienna on Jan. 15, 1877. When the Russian troops entered Bulgaria Count Andrássy did not proceed to the occupation of the provinces, and is said to have been driven from office by the pro-Russian party at court because he would not act in concert with Russia, and thus failed to obtain the absolute possession of the promised territory. The occupation finally took place by an arrangement arrived at after the cession of Cyprus to Great Britain, which Russia was precluded by the previous secret understanding from opposing. The Russian delegate at Berlin therefore acquiesced in the proposal of Great Britain to intrust Austria-Hungary with the pacification and administration of Bosnia and Herzegovina. M. Tisza, in an explanation to the Chamber on May 21, 1887, defended his statements made at the time by explaining that the conditions of the secret treaty were never fulfilled, and that the occupation was undertaken in obedience to the European mandate.

The Ausgleich.—A new ten-year treaty between the two states composing the empire was finally settled in May, 1887. The negotiations occupied an entire year, and on several occasions came to a stand-still. The difficulties which threatened to prevent a continuance of the customs league were not solved, but were simply waived or compromised for the sake of averting the external and internal dangers that would result from a breach of the fiscal union. Count Szapary broke off the negotiations in March, and refused to agree to a new basis suggested by M. Tisza, but in the Cabinet crisis that ensued was forced to resign his post as Hungarian Minister of Finances, and allow the Premier to conclude the arrangements. The Hungarians were desirous of formally incorporating in their kingdom the small strip of territory called the *Militärgrenze*, which is an integral part of Hungary, but is included in the old military boundaries of Austria. They assumed the share of this territory in the common expenditures, but, failing to obtain certain concessions, would not agree to a new apportionment of the burden which presses unequally on Austria, whose share in the common expenses for the ten years' period beginning Jan. 1, 1888, will be 68½ per cent., while Hungary pays only 81½ per cent.

Treaty Negotiations with Roumania.—There was a conference at Bucharest for the negotiation of a new commercial treaty with Roumania in March, 1887, but it led no nearer to a conclusion than the previous negotiations. The Rou-

manian delegates who met representatives of Austria-Hungary in Vienna in the winter of 1886-'87 proposed that inspection at the frontier should be abolished, and that herds consigned to Austria-Hungary should be examined only in the districts where the existence of disease was reasonably suspected. In the subsequent conferences the Roumanian Government modified its demand that the Roumanian cattle import should be admitted without quarantine, but insisted that it should be subjected only to the rules that are applied to the imports of Switzerland, Italy, and other treaty powers. An arrangement was about to be concluded on this basis, when the Hungarian Minister of Agriculture introduced conditions that were inconsistent with it, and unacceptable to the Roumanians, viz., that the Hungarian frontier should be closed to Roumanian cattle whenever Germany should prohibit the importation of cattle from Austria-Hungary, and that all cattle coming from Roumania should undergo a five days' quarantine at Steinbruch, near Buda-Pesth.

Austria.—The Austrian Parliament, called the Reichsrath, consists of two chambers—a House of Lords and a House of Deputies. The upper chamber was composed in 1886 of 18 princes of the blood royal, 58 hereditary peers, 10 archbishops, and 7 prince-bishops, and 105 life-members. The representative chamber consists of 358 members, elected partly directly and partly indirectly by all citizens of the age of twenty-four years or over possessed of a low property qualification. Important legislative powers are exercised by the Provincial Diets, seventeen in number, each of which consists of but one chamber composed of the heads of the Roman and Greek Churches, and chancellors of universities, and of representatives of land-owners, municipalities, boards of commerce, guilds, and of rural communes, the latter being voted for indirectly by all tax-payers.

The head of the Austrian Cabinet is Count Edward Taaffe, who, though his ancestors have lived in Austria for several generations, is an Irish nobleman, and a peer of the United Kingdom. He was appointed Minister of the Interior and President of the Council on Aug. 19, 1879. The Minister of Public Instruction and Ecclesiastical Affairs is Dr. Paul Gantsch von Frankenthurn, appointed Nov. 6, 1885; the Minister of Finance, Dr. J. Dunajewski; the Minister of Agriculture, Count Julius Falkenhayn; the Minister of Commerce and National Economy, Marquis von Bequehem; the Minister of National Defense, Maj.-Gen. Count S. von Welsersheimb; the Minister of Justice, A. Prazak. F. Ziemiakowski has a seat in the Council, but holds no portfolio.

Revenue and Expenditure.—The budget estimates for the year ending March 31, 1887, make the total receipts of the treasury 507,833,841 florins, and the expenditures 516,625,771 florins. The ordinary receipts are estimated at 491,927,845, and the ordinary ex-

penditures at 470,059,847 florins. The indirect taxes, viz.: a land-tax, a house-tax, a tax on industrial establishments, and an income-tax, produce 99,052,000 florins of revenue. The yield of customs is 47,243,417, of excise duties 84,484,900, of the salt-tax 20,444,000, of the tobacco-tax 74,002,800, of stamp-duties 17,800,000, of judicial fees 38,650,000, of the state lottery 20,224,000 florins, the total product of indirect taxation being 301,794,417 florins. The posts and telegraphs produce 27,299,050, and the railroads 47,171,917 florins. The chief items of expenditure are 117,975,054 florins for the service of the public debt, 98,578,071 florins for financial administration, and 86,888,808 florins for common affairs. The public debt on July 1, 1886, amounted to 8,485,881,810 florins, not including 412,000,000 florins of paper currency. About 50,000,000 florins of new paper *rente* were issued in the beginning of the financial year 1887-'88 to cover the financial requirements of the year.

The Language Question.—The German Liberals in the Austrian Chamber won a triumph over the Government in April, 1887, by carrying through a motion of ex-Minister von Schmerling, who is called the father of Austrian constitutionalism, providing for the appointment of a committee to consider the question of the use of other languages besides German in official documents and the pleadings of law courts. German has been acknowledged by the Government to be the official language of the empire, and the German party maintains that edicts that have been issued at various times authorizing the employment of the Czech, Polish, and Italian languages for judicial and administrative purposes are illegal. After the rejection of a resolution offered by Herr von Plener, the German leader in the Diet of Prague, all of his party threatened to take no part in the legislative proceedings until the Czech majority should agree to alter the law which makes the use of the Czech language sometimes compulsory in the law courts of German districts. In January, before closing its sessions, the Diet by a unanimous vote declared that the German abstainers had vacated their seats. In order to satisfy national or local ambitions the Government has in recent times established gymnasia in many country towns which are too poor to maintain them, and has in consequence been induced to aid the schools by annual grants. Dr. von Gantsch, the Minister of Education, declaring himself opposed to over-education and the multiplication of the intellectual proletariat, ordered in the summer that the least frequented of the schools should be closed. His decree resulted in the suppression of several Czech gymnasia, and brought upon the ministry the denunciations of the press of Bohemia.

Anarchist Trials.—Socialistic doctrines are more prevalent among the workmen of Austria than in Germany or any other country. The socialists are much stronger in Vienna than

in the other European capitals, and their theories are generally accepted also by the working-classes of Grätz, Klagenfurth, Brunn, and Reichenberg, and have taken deep root in Hungary, though their public expression is hindered by the new anti-socialist law of that country. The revolutionary socialists are not numerous in Austria, yet a band of desperate characters was organized among the industrial population of the suburbs of Vienna, with affiliated groups in other places, which the police detected just as some of their destructive plots were ripe for execution. In March, 1887, 15 anarchists were tried in Vienna before a special court of six judges without a jury, on the charge of preparing and secreting explosives. It was proved that they had entered into a conspiracy to fire several lumber-yards for the purpose of creating a panic, and that they had provided themselves with bombs and grenades charged with a powerful explosive. The ringleaders were a mason named Kaspari, and a weaver named Wawrunek. A tinsmith named Kratochwill had attempted to set fire to a lumber-yard, but the fuse would not burn. Two of the prisoners were acquitted, and the rest were sentenced to the penitentiary for terms ranging from six months to twenty years.

Hungary.—The Hungarian legislative authority is exercised by a Diet consisting of two branches. The upper house, called the House of Magnates, contains, under the law of 1885, all hereditary peers who pay a land-tax of 8,000 florins or over; archbishops, bishops, and certain other ecclesiastics of the Roman and Greek Catholic Churches, 39 altogether; 11 ecclesiastical and lay representatives of Protestant bodies; 50 life-peers who were elected by the house, but are to be hereafter nominated by the Crown; 16 high state and judicial dignitaries, who are members *ex-officio*; 1 delegate from Croatia and Slavonia; and the archdukes who are of full age. The House of Representatives in 1886 consisted of 453 members, of whom 40 were the delegates of Croatia and Slavonia. The ministry is composed of the following members: President of the Council, Koloman Tisza de Boros-Jenő, who in February, 1887, took over the Ministry of Finance on the resignation of Count Gyula Szapary; Minister of the Interior, Baron Bela Orozy, who succeeded the Prime Minister when the latter assumed charge of the finance department; Minister of Education and Worship, Dr. August Trefort; Minister of the Honved, otherwise called the Minister of National Defense, Baron Geza Fejérváry, appointed Oct. 28, 1884; Minister *ad latus*, Baron Orozy; Minister of Justice, Theophile Fabinyi, appointed May 17, 1886; Minister of Communications, Baron Orozy; Minister of Agriculture, Industry, and Commerce, Count Paul Széchényi; Minister for Croatia and Slavonia, Koloman de Bedekovich.

Revenue and Expenditure.—The total revenue in 1885 was 818,444,919 florins, and the ex-

penditure 858,645,446 florins. The estimated revenue for 1887 is 828,856,095 florins; the expenditure 850,400,021 florins, of which 111,882,886 florins are applied to the national-debt account, 29,470,424 florins to the common expenses of the empire, besides 4,150,917 florins of extraordinary expenditure, 56,106,852 florins to financial administration, 27,295,000 florins to state railways, 17,907,680 florins to investments, and 11,799,008 florins to debts of guaranteed railroads taken over by the Government. The public debt in the beginning of 1886 amounted to 1,842,880,881 florins, besides Hungary's share in the common debt of the empire, on which the interest charge is 80,000,000 florins per annum.

Parliamentary Elections.—The general election which began on June 17, was attended with the usual popular excitement, but with fewer disturbances than in former years. Notwithstanding the strong position of the Tisza Cabinet, corrupt inducements and administrative pressure were employed as usual to augment the Government majority. Count Albert Apponyi, the eloquent leader of the Moderate Opposition, made much of this practice of corruption in his arraignment of the Government, and summed up all the errors committed during Tisza's twelve years' premiership; yet the Government obtained a larger majority than ever. There were riots in five or six districts, in which many persons were killed and wounded. At Usbeck the troops were called out to quell a disturbance, during which 8 persons were killed and 30 injured. At Verbo the anti-Semites wrecked the polling-place, but the soldiery did not interfere. The result of the election was a majority for the Government of 108 to 56 in 1884. The Moderate Opposition, which numbered 67 members in 1878, was reduced to 44. The Independents, who had 70 seats in 1878, now secured 77, but the anti-Semites, who vote with them on general questions, lost a number of seats. The Nationalists also elected fewer members than in the last election.

Fires and Floods.—Hungary was visited during May and June with calamities of more than usual severity. Fires are of common occurrence in that country, and are shown by statistics to be particularly prevalent in the month of May. The unusual number of large fires in May, 1887, may have been the result, as is the case in Galicia, of the careless use of petroleum. The town of Toroczko in Transylvania was partially destroyed, and a day or two afterward the villages of Merenyo and Mezőcsanak were entirely consumed. On May 4 a fire broke out in the town of Arad which destroyed 150 houses and a large factory. In the mining town of Ruszkabanyi 111 houses were burned; and at Nagy Karolyi the family estate of the Counts Karolyi, including their mansion, 25 large workshops, and 225 other buildings, was destroyed. This was followed by a greater catastrophe at Eperies, the chief center of Prot-

estantism in Hungary, where all the churches, Government buildings, schools, banks, and a great number of dwellings and workshops were burned to the ground.

About the same time floods did great damage in various parts of the country, and culminated in a destructive inundation that swept over the alluvial district around Szegedin. After the destruction of that town in 1879 it was rebuilt on high ground, and a system of embankments was constructed at a cost of 44,000,000 florins for the purpose of securing the neighboring farming lands from the overflow of the Theiss. A sluice at Kistizza was badly constructed, and left in charge of a heedless or incapable inspector, with the consequence that on May 31 the river, which was swollen by rains but yet not within several feet of the

high-water mark, carried away the dam and flooded 80,000 hectares of growing wheat, destroying many farmsteads, and reducing nearly 2,000 families to destitution.

Croatia.—The vigorous measures of Count Khán-Hedervary, the Ban of Croatia, have broken up the National or Home-Rule party as an open political organization. The elections to the Croatian Diet, which took place a week before the Hungarian elections, resulted in the return of 86 Government candidates to only 19 of the Opposition. The Roman Catholic clergy head the Separatist movement in the Banat, but they are kept in check by the repressive means in the hands of the civil authorities. In August a clergyman was sentenced by the court at Agram to a year's imprisonment with hard labor for seditious language.

B

BAIRD, SPENCER FULLERTON, an American naturalist, born in Reading, Pa., Feb. 8, 1828; died in Wood's Holl, Mass., Aug. 19, 1887. He was graduated at Dickinson College in 1840, and in 1842 studied medicine at the College of Physicians and Surgeons in New York city, but was not graduated. Meanwhile, he devoted much time to long pedestrian excursions through Pennsylvania for the purpose of col-

lecting specimens in natural history, and his private cabinet ultimately became the nucleus of the museum connected with the Smithsonian Institution. In 1845 he was appointed, Professor of Natural History at Dickinson, also teaching chemistry, where he remained until 1850, when he was elected assistant secretary of the Smithsonian Institution. This office he held until May, 1878, when, on the death of Joseph Henry, he succeeded to the full secretaryship. The department of exploration was placed under his authority from its beginning, and his annual reports constitute the only systematic record of the National explorations ever prepared. During the decade of 1850-'60 he devoted much time to enlisting the sympathies of the leaders of Government expeditions in the objects of the Institution, supplying them with all the appliances for collecting, as well as with instructions for their use. In many instances he organized the natural-history parties, named the collectors, employed and supervised the artists in preparing the plates, and frequently edited the zoological portions of their reports. The specimens brought back to Washington were intrusted to his care. These, with his own collection and those obtained on the Wilkes exploring expedition during 1842, were the beginnings of the United States National Museum, which, under his administration, has developed until it is now unsurpassed throughout the United States. The system of international exchanges organized under the direction of the Smithsonian, is likewise due to his genius. In 1871 Prof. Baird was appointed Commissioner of Fish and Fisheries, an office which he held without salary until his death. This great work, organized by him, has grown until it includes: 1. The systematic investigation of the waters of the United States, and the biological and physical problems they present. 2. The investigation of the methods of fisheries, past and present, and the statistics of production and commerce of fishery products. 3. The introduction and multiplication of useful food-fishes throughout the country, especially in waters under the jurisdiction of the General Government, or those common to several States, none of which might feel willing to make expenditures for the benefit of others. In 1877, at the request of the United States Government, he was

SPENCER FULLERTON BAIRD.

lecting specimens in natural history, and his private cabinet ultimately became the nucleus of the museum connected with the Smithsonian Institution. In 1845 he was appointed, Professor of Natural History at Dickinson, also teaching chemistry, where he remained until 1850, when he was elected assistant secretary of the Smithsonian Institution. This office he held until May, 1878, when, on the death of Joseph Henry, he succeeded to the

present at the Halifax Fishery Commission in the capacity of advisory counsel. His work on fisheries has been honored with awards of medals from the Acclimation Society of Melbourne in 1878, and from the Société d'acclimation de France, in 1879; the first honor prize from the International Fish Exhibition held in Berlin in 1880, and the order of St. Olaf from the King of Norway and Sweden. The degree of Doctor of Physical Science was conferred on him by Dickinson College in 1886, and that of LL. D. by Columbian University in 1875. For many years he was a trustee of the latter institution, and from 1878 filled a similar appointment to the Corcoran Gallery of Art in Washington. He was Permanent Secretary of the American Association for the Advancement of Science in 1850-'51, and edited the proceedings of the fourth, fifth, and sixth meetings. In addition to being a member of the leading scientific societies in the United States, he held foreign or honorary membership in many of the scientific societies in Europe and the British colonies, and became a member of the National Academy of Sciences in 1864. The nomenclature of zoölogy contains many memorials of his connection with its history. One genus of fishes was called in his honor by Prof. Theodore N. Gill, and over twenty-five species of mammals, birds, fishes, mollusks, and other forms of life bear his name, together with several fossil or extinct varieties. His literary work was very great, and a complete bibliography from 1843 till 1882, including 1,063 titles, was prepared by George Brown Goode, and issued as number twenty of the "Bulletins of the United States National Museum" (Washington, 1883). From 1870 till 1878 Prof. Baird was the scientific editor of Harper and Brothers' periodicals, including the "Annual Record of Science and Industry" (8 volumes, New York, 1871-'79). The various reports and annual volumes of the United States Commission of Fish and Fisheries were prepared by him, and also the annual "Reports of the Board of Regents of the Smithsonian Institution" from 1878. His other works include the translating and editing of the "Iconographic Encyclopædia" (4 volumes, New York, 1852); "Catalogue of North American Reptiles" (Washington, 1853); "Mammals of North America" (Philadelphia, 1859); "The Birds of North America," with John Cassin (1860); "Review of American Birds in the Museum of the Smithsonian Institution" (Washington, 1864-'66); and "The Distribution and Migrations of North American Birds" (1866). His latest work was a "History of North American Birds," prepared with Thomas M. Brewer and Robert Ridgway (5 volumes, Boston, 1874-'84). Prof. Baird's ornithological studies were placed by him, in 1887, in the hands of Robert Ridgway, and since his death have been published as "Manual of North American Birds" (Philadelphia, 1887).

BAPTISTS. I. Regular Baptists in the United States. The following is a summary of the statistics of the Regular Baptist churches in the United States, as given by States in the "American Baptist Year-Book" for 1887:

STATES AND TERRITORIES.	Associations.	Ordained ministers.	Churches.	Members.
Alabama	100	1,228	2,172	164,928
Arizona	1	5	6	140
Arkansas	59	802	1,443	76,080
California	8	185	180	6,499
Colorado	8	82	84	3,525
Connecticut	6	187	126	21,745
Dakota	5	55	86	2,664

The whole number of Sunday-schools is given as 18,889, with 107,087 officers and teachers, and 1,011,585 pupils; number of additions to the churches by baptism, 155,378; value of church property, \$42,558,794. Amount of contributions reported: for salaries and expenses, \$5,549,563; for missions, \$849,837; for education, \$108,749; miscellaneous, \$1,384,881; aggregate, \$7,843,081.

The "Year-Book" gives, of general statistics in North America (including the United States), 1,268 associations, 81,507 churches, 19,986 ministers, 160,173 baptisms during the year, and 2,844,491 members; for South America (Brazil), 5 churches, 12 ministers, 28 baptisms, and 168 members; for Europe, 67 associations, 3,500 churches, 6,642 ministers, 5,488 baptisms, and 888,971 members; for Asia, 8 associations, 983 churches, 560 ministers, 3,467 baptisms, and 65,657 members; for Africa, 3 associations, 82 churches, 56 minis-

ters, 180 baptisms, and 3,212 members; and for Australasia, 6 associations, 159 churches, 113 ministers, and 15,527 members. Total, 1,352 associations, 36,186 churches, 27,368 ministers, 169,281 baptisms, and 3,813,026 members.

Seven theological institutions in the United States returned 48 instructors and 543 pupils; 27 universities and colleges, 251 instructors, and 8,660 pupils; 30 institutions for the education of young women exclusively, 281 instructors and 2,899 pupils; 43 seminaries and academies and institutions for both sexes, 258 instructors and 4,757 pupils; and 19 institutions for the colored race and Indians, 154 instructors and 3,776 pupils. In all, 126 educational institutions, 1,092 instructors, and 15,635 pupils.

American Baptist Home Mission Society.—The fifty-third anniversary of the American Baptist Home Mission Society was held in Minneapolis, Minn., May 30. Mr. Samuel Colgate presided. The total receipts of the society for the year had been \$552,814, or \$15,000 more than the receipts of the previous year. Of this sum \$349,797 were returned as contributions from churches, Sunday-schools, and individuals; \$158,257 from legacies; \$17,599 as income from church-edifice loans and invested funds; and \$19,987 from the schools of the society. The Executive Board in making appropriations had adhered to the rule of limiting them to the average of annual receipts of the three years preceding. The expenditures had been \$290,887, of which \$180,666 had been for ministers' salaries, \$59,261 for teachers' salaries, \$41,443 for special educational purposes, \$29,296 in gifts for church-edifice work, and \$31,855 for expenses of administration and agencies. In addition to these expenditures, the indebtedness of the previous year, \$123,429, had been paid off with the results of special offerings. A settlement had been effected with Mr. J. H. Deane, a former treasurer of the society, whose failure in business had involved the society in financial loss (see "Annual Cyclopædia" for 1886), by which he was to pay 50 per cent. of the deficiency in his accounts, or \$66,000 in stated instalments. The summary of the missionary work showed that 678 laborers had been employed in the supply of 1,385 churches and out-stations having a total church membership of 28,898, with 678 Sunday-schools, returning a total attendance of 44,740 persons; also that 129 churches had been organized, and 3,800 members had been added by baptism. The amount of benevolent contributions reported from the mission churches was \$28,539. Besides the stations among American populations, the society had assisted the German Baptist Convention among the Germans of Ontario; had aided the Scandinavian churches, particularly in Minnesota; had labored among the French in Maine, Massachusetts, Rhode Island, Connecticut, and Illinois; and among the colored people in various States of the South

and North; had sustained 12 missionaries to Indians in the Cherokee Nation, among the Delawares, and to Sacs and Foxes of the Indian Territory, and at the Pyramid Lake and Walker river reservations; had maintained missions among the Chinese in California and Oregon; and had supported missions in Mexico. In the church-edifice department, grants had been made to 62 churches in the shape of \$10,818 in gifts and \$13,325 in loans; while receipts were acknowledged to the Loan Fund of \$7,051, and to the Benevolent Fund of \$78,645. The Loan Fund amounted to \$122,047, and was regarded as sufficiently large for all demands that were likely to be made upon it. The educational institutions of the society included 11 incorporated and 6 unincorporated institutions; with mission day-schools, largely supported by the Woman's American Baptist Home Mission Society of Boston, in Salt Lake City, the city of Mexico and Salinas, Apodaca, and Santa Rosa, Mexico, and Tahlequah, in the Indian Territory; and mission night-schools for the Chinese in Oakland, San Francisco, and Fresno, Cal. Fifteen schools for the colored people were supported wholly or in part by the society, while Leland University, New Orleans, with an endowment of nearly \$100,000, had become self-supporting. These schools had employed 122 teachers, 28 of whom were colored, and returned 2,807 pupils. Ministerial training was provided for at several of these schools, industrial education in many of them, with appropriations from the "Slater Fund" at seven, and medical education in the Leonard Medical School, at Raleigh, N. C., and for women at Spelman Seminary, Atlanta, Ga.

American Baptist Publication Society.—The sixty-third anniversary of the American Baptist Publication Society was held in Minneapolis, Minn., May 25, 26, and 27. Mr. Edward Goodman, of Illinois, vice-president, presided. The total receipts and business of the society in all of its departments for the year had been \$624,140. The business of the year had amounted to \$481,997. The Board of Managers reported that a defalcation by two of the bookkeepers had caused a loss to the business department computed at the date of the meeting to amount to \$24,156. One hundred and ninety-four new works had been published, of which 331,500 copies had been issued, and 737,300 copies of new additions of former publications had been printed; while the whole number of books, tracts, and periodicals printed during the year was 26,751,300. The gross receipts of the missionary department had been \$8,084 less than in the previous year. The receipts for permanent investment funds in this department had been \$8,500. The gross receipts in the Bible department had been \$15,972. Seventy-eight missionaries had been employed, under whose labors 710 persons had been baptized, 43 churches constituted, 311 Sunday-schools organized, 501 institutes held and addressed, and 1,822 Sunday-schools and

214 pastors and ministerial students had been aided with grants for their libraries. Grants had been made in the Bible department of Scriptures in 18 languages and 21 versions, to the number of 50,000 copies. Special reports were made respecting the mission to the Armenians in Turkey, which was begun at the request of converted Armenians to be appointed to work among their countrymen, after the American Baptist Missionary Union had declined to act in the matter, in 1888. The Missionary Union had been invited several times to take charge of the work, but had declined on each occasion. Other missionaries had been appointed, and the society had now four missionaries or colporteurs at Constantinople, Arabkir, Erzeroum, and some field to be selected; with 82 members at Constantinople, and two schools for girls with 40 pupils, a church attendance of 1,810, and a Sunday-school attendance of 1,612 at Erzeroum. Another report concerned the relations of the mission with the American Board, with whose Armenian missions the Baptist work appeared to many persons to be in rivalry. It maintained the right and duty of the society to continue and sustain the mission. Resolutions were adopted making this report the expression of the society, and again inviting the American Baptist Missionary Union to assume charge of the work among Armenians, appointing the present missionaries and accepting the money and pledges which had been gathered for their support. The Board of Managers was urged by resolution to publish tracts and treatises bearing upon the subject of temperance and in opposition to the traffic in intoxicating liquors for the purpose of use as beverages.

American Baptist Missionary Union.—The seventy-third anniversary of the American Baptist Missionary Union was held in Minneapolis, Minn., beginning May 27. The Rev. Edward Judson, D. D., presided. The receipts of the society for the year had been \$406,689. The missions of the society to the heathen include the Burman, Karen, Shan, Kachin, Chin, Assamese, Garo, Naga, and Telugu missions in Burmah and India; the Chinese missions in Bangkok, Siam, and in China; the mission in Japan; and the African missions, on the west coast, in the Congo, and "at home." These returned altogether 54 stations, and 974 out-stations, 248 European missionaries, 780 native preachers, 92 Bible-women, and 244 other native helpers—making a total missionary force of 1,859 persons; 624 churches, with 58,108 members, and 3,290 baptisms during the year, 216 Sunday-schools, with 11,841 pupils, and 778 day-schools, with 874 native teachers and 16,560 pupils. The missionary property at all these stations was valued at \$492,077. The contributions of the mission stations were returned at \$38,040. The European missions in Sweden, Germany, France, Spain, and Greece, returned 950 preachers, 641 churches, and 65,422 members, with 6,052 baptisms during the

year. The Board of Managers had been applied to by the Bishop of Rangoon and the British and Foreign Bible Society, for permission to publish the Missionary Union's translations of the Bible into the language of Burmah, substituting ordinary terms or the Greek words untranslated for the more specific terms relating to baptism used in these versions. The request had been declined. The Board of Managers was authorized to accept the direction of the missionary work in Armenia now carried on by the American Baptist Publication Society, such acceptance to be conditioned upon the favorable report of a specially-appointed committee of investigation. A resolution of protest was adopted against permitting the importation of strong drink into the newly-opened Congo Valley in Africa, and a committee was appointed to invoke such help as it might be possible to secure from the Government of the United States to prevent such importation.

Other Baptist Societies.—The American Baptist Historical Society, Philadelphia, has a permanent fund of \$3,600.

The Woman's Baptist Foreign Missionary Society, having its office at Boston, returned its receipts, according to the "American Baptist Year-Book" for 1887, at \$59,709. It sustained in Asia, Europe, Japan, and Africa 27 missionaries and 109 schools, with 4,049 pupils.

The Woman's Baptist Foreign Missionary Society of the West, having its central office at Chicago, reported an income of \$31,595, 25 missionaries, 147 schools, 46 native teachers, and 1,656 pupils.

The receipts of the Woman's Baptist Home Mission Society, Chicago, were \$48,240. It sustained 68 missionaries.

The Woman's American Baptist Home Mission Society of Boston, reported the receipt of \$24,017, and employed 28 teachers.

German Baptists.—The triennial German Baptist General Conference includes five annual conferences, with which are connected, in all, 12,676 members.

Southern Baptist Convention.—The Southern Baptist Convention met in Louisville, Ky., May 6. The Rev. P. H. Mell, D. D., was chosen president. The Board of Home Missions presented a summary of its work during the year as follows: Number of missionaries, 251; of churches and stations, 822; of baptisms, 3,928; received by letter, 2,319; total additions, 6,242; Sunday-schools reported, 318; teachers and pupils, 18,081; churches constituted, 119; houses of worship built, 62; cost of houses and lots, \$60,000.

The Choctaw Indians, under the direction of an agent of the Board, were endeavoring to establish a Baptist school within the nation, and had nearly completed a building for it at Atoka. Three churches had been constituted in Cuba, the oldest of which, at Havana, had 101 members. These churches also returned 6 candidates for the ministry, 4 Sunday-schools,

with 17 teachers and 400 pupils, and 2 day-schools, with about 150 pupils. Report was made concerning co-operation in sustaining churches with the local organizations in various States, and of work among the colored people. The Woman's Missionary Societies had contributed \$2,231 to the funds of the board, had supported three laborers in the field, and had given aid to the Levering-School in the Indian Territory.

The receipts of the Board of Foreign Missions had been \$87,955, and its disbursements, \$87,744. The financial exhibit was the best the board had ever been able to make. The missions—which are in Brazil, Mexico, Italy, Africa (Yoruba Mission, etc.), and China—returned, in all, 116 missionaries, native and foreign; 65 churches and stations; 1,551 members; 228 baptisms during the year; 25 schools, with 587 pupils; and \$3,012 of contributions.

Colored Baptist Organizations.—The colored Baptists of the United States are represented in the American National Baptist Convention, and the Baptist General Association of the Western States and Territories.

The American Baptist National Convention of colored churches in the United States was organized at a meeting held in St. Louis, Mo., August 25, 1886, with William J. Simmons, of Louisville, Ky., as president. Seventeen States were represented by delegates and visitors. Papers were read and lectures delivered on subjects relating to colored Baptists and the interests of the Baptist Church, and an Executive Board was organized, to have its headquarters at Louisville, Ky.

The receipts of the Baptist General Association of the Western States and Territories were \$5,163. The association had sent two missionaries to the Congo Valley in Africa. Steps were taken at its meeting in 1886, for consolidating its work with that of the American Baptist National Convention.

Baptist Congress.—The sixth annual session of the Baptist Congress was held in Indianapolis, Ind., November 15, 16, and 17. Mr. William S. Holman presided. The proceedings consisted in the discussion of the following subjects, in papers and brief addresses: "The Organic Union of Christendom," Rev. G. D. Boardman, D. D., Prof. Norman Fox, the Rev. Dr. Bulkley, and volunteer speakers; "Phases of the Labor Problem," "The Land Question," by the Hon. J. R. Doolittle, and the Hon. Allen Zollars; and "Profit Sharing," by Prof. Moncrief, of Franklin College; "The Proper Functions and the Influence of the Newspapers of To-day," R. J. Burdette, the Rev. Dr. G. W. Lasher, and the Rev. H. L. Wayland, D. D.; "Improvements in Methods of Theological Education," Rev. W. O. Wilkinson, D. D., and Rev. Dr. H. C. Mabie; "Woman's Work in the Church," Rev. Dr. W. M. Lawrence, Rev. M. Willmarth, and volunteer speakers; "The Proper Attitude of the Church toward Amuse-

ments," Rev. M. Watson, Rev. T. I. Eaton, D. D., Rev. Dr. E. A. Wood, and Rev. Kerr B. Tupper; and "The Sin of Covetousness," Prof. Stilder, the Rev. Dr. C. R. Henderson, and Rev. Dr. P. S. Henson.

II. Free-Will Baptist Church.—The "Free-Will Baptist Register and Year-Book" for 1887 gives in the summary of the statistics of forty-eight yearly meetings of the Free-Will Baptist Church, 194 quarterly meetings, 1,542 churches, 1,291 ordained preachers, 5,988 licensed preachers, and 82,323 members. Twelve new yearly meetings united with the General Conference at its last session (six of them mainly composed of colored people), the membership of which is about 6,500. They are all in the Western and Southern States.

The Free-Will Baptist Education Society received and disbursed in 1886, \$3,228. Its funds were: Permanent fund, \$1,000; Library fund, \$2,235; E. True fund, \$9,965. One hundred students were preparing for the ministry in the schools of the Church. The Free-Will Baptist Home Mission Society had received and expended \$9,126, and returned a permanent fund of \$10,355. The special appropriations to missions amounted to \$7,449. The receipts of the Free-Will Baptist Foreign Mission Society had been \$14,781. It returned a permanent fund of \$9,283, a Bible-school fund of \$18,186, and a Bible-school hall fund of \$50. The mission, which is in India (Bengal and Orissa), returned 558 communicants; 16 additions by baptism; a native Christian community of 1,085 persons; 2,904 pupils in Sunday-schools; and 3,563 pupils in other schools. The native contributions amounted to 585 rupees. The educational institutions comprise five colleges (one, Storer College, at Harper's Ferry, W. Va., with a State Normal and Academic Department in operation, largely attended by freedmen), and five seminaries and academical schools. Other benevolent institutions are the Temperance Society, the Sunday-School Union, and the Woman's Mission Society.

III. Seventh-Day Baptist Church.—The position of the Seventh-Day Baptist Church is described by the Rev. A. H. Lewis, D. D., author of "Sabbath and Sunday," and the "Seventh-Day Baptist Handbook," as that of making a plea for the Sabbath (as distinguished from Sunday) "not on merely denominational grounds, nor as a sectarian peculiarity, but rather as a fundamental requirement of God's moral government. We plead for a return to the Sabbath as against the Sunday, because there is no scriptural warrant for the change, and because the verdict of history is, that the reason assigned for observing Sunday, and the method adopted for upholding it, have failed to create conscience toward God, and hence to make of it a sacred day."

Statistical reports to the General Conference from 75 of the 110 churches gave the number of members therein as 8,255. Seventy-nine Sabbath-schools returned 485 teachers,

and 6,557 members. The contributions reported were: for the Tract Society, \$4,216; for the Missionary Society, \$4,860; for educational purposes, \$44,687. The treasurer of the memorial fund reported that the total amount of assets in his hands on account of that enterprise was \$80,688.

The receipts of the Seventh-Day Baptist Tract Society for the year, derived from sales and contributions, were \$16,078. The society publishes one quarterly, one monthly, and two weekly journals in the English language, and monthly journals in the Swedish, Hebrew, and Dutch languages. The "Hebrew Journal," which is printed without points, has been well received by Jews in various parts of the world, particularly in Southern Russia and Asia Minor.

The total receipts of the Missionary Society were \$11,588, and its expenditures were \$10,858. Four foreign missionaries and 20 home missionaries were employed. The mission in China returned 2 foreign and 8 native laborers, with 3 teachers and 54 pupils, and 1 church with 18 members. The medical mission at Shanghai had served 1,407 patients. The mission in Holland returned 55 Seventh-Day Baptists, at 12 different places. The 3 churches at Haarlem, Amsterdam, and Rotterdam included 32 members. Missionary work had been begun among the Jews. The Woman's Board returned receipts amounting to \$5,001.

The Seventh-Day Baptist General Conference met in its seventy-third session at Shiloh, N. J., September 21. A. B. Prentice presided. A committee appointed to correspond with persons interested in the Sabbath cause reported that it was in correspondence with about 100 such persons. The committee on denominational history recommended the opening of a department on that subject in either the "Seventh-Day Baptist Quarterly," or the "Sabbath Recorder." A declaration was adopted in favor of the prohibition of the liquor traffic. A part of the time of the Conference was devoted to the discussion of special topics bearing on the interests of the denomination.

IV. Baptists in Great Britain.—According to the "Baptist Hand-Book" for 1887, there are in the British Isles 2,742 churches, 8,787 chapels, 1,192,274 chapel-seats, 802,615 members—47,170 teachers, and 456,694 pupils in Sunday schools, 4,041 local preachers, and 1,868 pastors in charge.

The "Spring Session" of the Baptist Union of Great Britain and Ireland was held in London, beginning April 25. The Rev. Dr. Culross, of the Bristol Baptist College, was instituted president for the year. The report of the council gave the amount of funds received during the year for all the purposes in which the Union is interested as £20,630. Good results were claimed from the visitation of the churches. It had been resolved to raise a Jubilee fund for the further extension and consolidation of the British and Irish Mission. The value of

the securities belonging to the Annuity fund was estimated to be upward of £117,000; and the number of beneficiary members on the books was 846. The council had applied to be heard before the special committee of the House of Commons in opposition to the bill before Parliament respecting the attendance of registrars at non-conformists' places of worship.

The annual meeting of the Baptist Missionary Society was held April 26. Sir Robert Phayse presided. The receipts of the year had been £69,252, the largest amount ever returned. The expenditures had, however, exceeded the resources of the society by £2,885, and had been £3,341 in excess of the expenditures of the previous year. The increase had been mainly in India, China, and Ceylon, and were incidental to the reinforcements of the missions in those countries, particularly in China, where, within the last few years, the mission staff had been increased from 2 to 21. Nineteen brethren had been accepted for missionary service, 8 of whom had been sent to China, 6 to the Congo, 8 to India, and 2 to Ceylon. The committee had had considerable anxiety in consequence of the transfer by the British Government of the Cameroons, including the Victoria settlements, to the Germans, without inquiring whether the Baptist missionaries were willing to become German subjects. After protracted but fruitless negotiations with the view of inducing the German Government to purchase the mission station and property, the latter had been sold on satisfactory terms to the Basle Mission. Another matter of general interest had been the application of Mr. Stanley to be allowed the use of the steamer "Peace" for the Emin Bey relief expedition. It was found impossible to grant the request without violation of the conditions laid down by Mr. Arthington, the donor of the vessel, who refused to allow it to be employed in any way for military purposes. In India, numerous conversions were reported; forty new Christian schools had been established, and a large number of educated natives were preparing for the ministry and the work of teaching in the schools. In China, an institution had been started for the training of Chinese Christians and of parties of "self-supporting" congregations.

The missions of the society in India, Ceylon, China, Japan, Africa, the West Indies, and Jamaica, and parts of Europe, return 94 ordained and 48 other European missionaries, 66 native ordained missionaries, 800 evangelists, 866 teachers, 45,113 communicants, 26,679 pupils in Sunday-schools, and 16,351 pupils in day-schools.

The receipts of the Baptist Zenana Mission for the year had been £6,422, and the expenditure £6,920. The working-staff of the society in the mission fields consisted of 44 lady zenana visitors, 17 assistants, and 104 native Bible-women and teachers; 1,206 zenanas were regularly visited, 1,800 pupils were receiving daily

instruction, 50 schools and 1,650 pupils were superintended by the mission, and 20,000 patients were cared for in the dispensaries. The work of the society is chiefly carried on in the large cities of India, including Calcutta, Delhi, and Agra.

The autumnal meetings of the Baptist Union were held in Sheffield, beginning October 8. The proceedings consisted chiefly of meetings in behalf of the societies connected with the Union, and addresses on subjects pertaining to the work and interests of the Baptist churches, among which were the address by the President, Rev. Dr. Culross, on "Belief on the Son of God"; "The Churches and the Coming Ministry," by the Rev. O. P. Gould; "The Work of the Church among the Young," by the Rev. S. R. Aldridge; "Christian Fellowship," by the Rev. E. Medley; "The Practical Aspect of Christian Fellowship," by the Rev. Dr. Landels, and addresses to workingmen.

The Rev. O. H. Spurgeon gave notice of his withdrawal from the Baptist Union, by publication in his journal, "The Sword and Trowel," for November, and in a letter to the secretary of the body, dated October 28. As a reason for taking this step, he affirmed that the Union was tolerating error, and permitting a "downward tendency" of ministers in points of doctrine, in that some persons were allowed to remain in it who make light of the atonement, deny the personality of the Holy Ghost, call the fall of man a fable, speak slightly of justification by faith, refuse credence to the dogma of the plenary inspiration of the Holy Scriptures, and hold that there is another probation after death, with possibilities of a future retribution of the lost; while efforts to induce him to reconsider his decision were without avail, he declared that he remained as much a Baptist as ever, his denominationalism not being affected by his relations with the Union; a voluntary, unofficial body.

The Baptist Union of Scotland consists, according to the report made by the secretary to the annual meeting in October, of 85 churches, with 10,880 members. The number of baptisms during the year had been 928. There were connected with the Union 76 Sunday-schools, with 1,015 teachers, and 8,961 pupils.

General Baptists.—The annual meetings of the General Baptist Assembly were held in London, beginning May 31. The Missionary Society returned an income of £7,625, 8 ordained and 9 woman European missionaries, 24 native ministers, 1,286 communicants, and 3,366 adherents. The principal mission is in India.

BEECHER, HENRY WARD, an American clergyman, born in Litchfield, Conn., June 24, 1813; died in Brooklyn, N. Y., March 8, 1887. He was the eighth child of Lyman and Roxana Foote Beecher. His mother died when he was but three years old, and his stepmother was by birth and early education an Episcopalian. Thus the early influences that surrounded Mr. Beecher tended to that catholicity which

was so characteristic of him. For both mother and stepmother he had a profound reverence, which showed itself in habitual reference in his public ministry to the sacredness of motherhood. His home education was of the severe New England type, alleviated by the irrepressible sense of humor in his father, and by the poetic and mystical influence of his stepmother. He was graduated at Amherst College in 1834. His college life was fruitful, though not in the ordinary sense studious; he made his mark chiefly outside the recitation-room, and yet he was a great reader, following the bent of his own inclination rather than the lines laid down by his instructors. He made even then a careful study of English literature, analyzing the elements of style in different writers and orators, submitted himself to a thorough course of training in elocution, took hold of phrenology—not, of course, a college study—with great zest, gave lectures upon it, and upon temperance, and participated in class-room meetings and religious labors in the neighboring country towns. The time was one of great religious ferment; reaction had already set in against the purely intellectual in theology, the literalism in Biblical interpretation, the hardness in spiritual thinking, and the lack of what we may call the humanities in religion, which characterized the early epoch of New England history. The Unitarian defection from the orthodox Congregational faith had already taken place; the first great missionary organization of the Puritan churches—the American Board—had just been formed, and incipient indications pointed to that bitter struggle between the New School and the Old School theology, in both Presbyterian and Congregational churches, which was the most eventful feature in church history during the early years of Mr. Beecher's manhood.

Mr. Beecher himself was thoroughly grounded in the intellectual elements of Congregational evangelical belief; for his father was an intensely polemical and orthodox though liberal divine. In Mr. Beecher's case, the reaction against the excessive intellectualism of a too rigorous Puritanical faith, took the form of a spiritual experience, as it must necessarily have done in one of his emotive temperament; an experience that transformed his entire being, and pervaded all his subsequent life. "I know not," he says, describing this experience, "what the tablets of eternity have written down; but I think that when I stand in Zion, and before God, the brightest thing which I shall look back upon, will be that blessed morning of May, when it pleased God to reveal to my wandering soul the idea that it was his nature to love a man in his sins, for the sake of helping him out of them; that he did not do it out of compliment to Christ, or to a law, or a plan of salvation, but from the fullness of his great heart; that he was a being not made mad by sin, but sorry; that he was not furious with wrath toward the sin-

ner, but pitied him—in short, that he felt toward me, as my mother felt toward me, to whose eyes my wrong-doing brought tears, who never pressed me so close to her as when I had done wrong, and who would fain, with her yearning love, lift me out of trouble." From this eventful May morning dated his consecration to the Christian ministry, a self-consecration, which subsequent intellectual doubts and difficulties, though often serious, never induced him to abandon, even temporarily. He returned from college to his father, who had now moved to Cincinnati, to take the chair of Systematic Theology in Lane Seminary, and entered there upon his theological studies. The same variety of mood and largeness of sympathy that on the one hand had given breadth, but on the other had prevented discipline, in his college life, followed him into the seminary, where, while he pursued his theological studies, he did successful service as editor of a Cincinnati paper, in which he took occasion to give ardent expression to his anti-slavery views: and at the same time he assumed charge of a Bible-class, in the teaching of which he cleared, if he did not absolutely dissipate, his religious doubts, and settled finally, not only his own personal relation to Jesus Christ as a living friend and helper, but his own mission as a preacher of that Christ as the friend of each individual soul, and so the regenerator of society. In 1837 he began his ministry in the town of Lawrenceburg, Indiana, a small settlement on the Ohio river, which at one time had the ambition to be a rival of Cincinnati, but is now a comparatively insignificant village. The parish was not such a one as young men graduating from the seminary in our time are usually eager for. The church consisted of nineteen women and one man; the pastor acted as sexton, filled and lighted the lamps, swept the church, made the fires, opened the church before prayer-meetings and preaching, and locked it up afterward. His pastorate here was of short duration. In 1839 he was called to a Presbyterian church in Indianapolis, the capital of Indiana. Here he delivered his "Lectures to Young Men," which are still in print, and are a remarkable specimen of the power of graphic rhetoric. In them he depicts, as from a personal and practical knowledge, the dangers that threatened the young men of the capital, where all evil influences quickly gathered. With his peculiar skill in drawing men out, he made the acquaintance of one of the most noted gamblers in the city; from him elicited the secrets and methods of his trade, and utilized the knowledge in one of his Sunday evening lectures. His church was crowded, and among his most eager listeners were members of the Legislature, when it was in session. His library was small, and his income meager, but he made himself felt, not only in the city but throughout the State, through which he frequently made journeys, for the purpose of

conducting revival services, then far more common than in our time. He was wont to preach daily for weeks, and even for months at a time; and once this daily preaching lasted through eighteen consecutive months without the exception of a single day. For recreation he took to the study of horticulture, and agriculture, and to writing on those topics for the "Indiana Journal," the agricultural department of which he for a time edited.

In 1847 he accepted a call to Plymouth Congregational church then just organized in Brooklyn, N. Y., on the Heights. His first sermon was delivered on Sunday, Oct. 10, 1847, and contained an exposition of his views with regard to slavery, war, temperance, and other moral reforms, as well as in regard to theology, which in his thought and experience centered wholly about Christ as the revelation and disclosure of the true character of God. In the nearly forty years' pastorate in this church, which made up the rest of Mr. Beecher's life, he never varied from the platform of principles laid down in that opening sermon, except by broadening and extending it. Under his pastorate the church grew steadily both in numbers and in influence; it now contains, in round numbers, twenty-four hundred members. It has a creed, adopted in 1848, which is strictly evangelical; but since 1870 persons uniting with the church are not required to assent to this creed; they simply assent to a covenant of consecration to the service of God, and to acceptance of his Word as the rule of their life. While the additions to the church have been for the most part steady and gradual rather than intermittent and extraordinary, its life has been characterized by some notable revivals of religion; in one of which (1858) three hundred and thirty-five persons made profession of their faith. Except in the summer vacations, and four visits to Europe, Mr. Beecher was rarely absent from his pulpit, even for a single service, for he rarely exchanged; the church throughout the period of his ministry was always crowded, both morning and evening, and with two distinct congregations; for the pastor urged his people to remain away in the evening, and leave their pews vacant for strangers. The original church-building was destroyed by fire in 1849, and the present structure was erected in its place, with accommodations for about twenty-eight hundred persons, and with lecture-room, Sunday-school room, social parlors, and kitchen attached.

While Mr. Beecher's great work was that of a preacher, it was by no means confined to preaching. He began editorial work in Cincinnati, before he was licensed to preach, and retained an interest in journalism in some form throughout the greater part of his life. He was connected with Drs. Richard S. Storrs, Leonard Bacon, and Joseph P. Thompson in the New York "Independent," in the stormy anti-slavery times out of which it was born. He subsequently withdrew from the "Inde-

pendent," and founded the "Christian Union," with which he remained connected as editor-in-chief, until 1881, when the pressure of other public duties and an increasing disinclination to the slow process of the pen led him to withdraw, and devote his energies exclusively to the pulpit and the platform. The catholicity, that in its birth, he imparted to the "Christian Union," was then wholly unknown in religious journalism. It was supposed to be necessary, to have a special church constituency behind each religious organ. Even the great reviews represented each a religious school, and such monthly symposia as the "Nineteenth Century," and the "Contemporary," in which atheists and Roman Catholic churchmen sit down at the same table, were not dreamed of in the public mind.

Mr. Beecher's work as a moral reformer and political instructor has been even more prominent than his work as either a theological thinker or a preacher. Living in the most exciting period of American history, he threw himself with ardor into the anti-slavery conflict, and from the day of his first occupancy of Plymouth pulpit took a front rank on a platform that abounded with orators, and in an epoch that evoked oratory such as has been heard in America at no other time in American history. No other single voice did more than his to arouse the North against the encroachments of the slave power, and the various devices under which its campaign was carried on. Against the abolition of the Missouri compromise, against "squatter sovereignty," against the fugitive slave law and the compromise measures of which it was a part, against the doctrine of secession and all yielding to it, against slavery itself, from which all these proceeded, his voice was heard in eloquent, indignant, continuous protest in pulpit and press and on the platform. Yet in this indignation, he never lost mental balance or a certain moral composure and self-restraint. Believing with the abolitionists that slavery was a crime against humanity and against God, he yet never joined them in either personal execration of the slaveholder or in condemnation of the Constitution or the union of the States, which that Constitution cemented and secured. He took an active part in several of the great presidential elections. In that in which Mr. Lincoln was elected for the second time (1864) he took an active part upon the stump, and his voice exerted a powerful influence in securing the election of Mr. Cleveland in the presidential canvass of 1884. But by far the most remarkable of his political addresses were those delivered by him in Great Britain in 1863—in Manchester, Glasgow, Liverpool, and London, each address distinct, and prepared with special reference to the audience there gathered. The great danger to the national cause in our civil war was from intervention of European powers, England, especially. To these four addresses, more than to any

other one cause, America owes it that the public sentiment of the common people in England was changed from one of apathy or hostility to one of sympathy; and it is not too much to say that Mr. Beecher, by at once instructing and giving voice to the silent moral sentiment of the democracy of Great Britain, not only prevented all danger of intervention, but cemented an alliance between England and America which has gained in strength from that day to this. Subsequent to the civil war and the consequent recession of the great moral issues, Mr. Beecher added to the work of the pulpit that of a popular lecturer; always, however, speaking on serious subjects, and for a serious purpose. His lecture agent is reported as saying, that, as the result of fourteen years of lecturing, he was paid \$240,000 over and above his traveling expenses, an indication not indeed of his moral power as an orator, but of his popularity.

A man so active, so intense, and so outspoken, in times of heated debate, could not but make many and bitter enemies. Throughout his half-century of public life Mr. Beecher was a target of innumerable attacks from men who either from self-interest feared, or from conservative considerations dreaded, the effect of his teaching. Of these attacks one only cast any shadow upon his name. He was accused of immoral relations with the wife of one of his church-members. The accusation at first was allowed to drift into the public press by piecemeal, but rumor at length resulted in definite charges, and finally in a public trial, in which the only evidence offered against him was that of alleged confessions, which he, under oath, explicitly denied, and of letters that were ambiguous in their meaning, to which he, under oath, gave an innocent construction. The jury disagreed; standing nine for Mr. Beecher, against one for the plaintiff, while two voted variously on different ballots. This suit was never tried again; a second suit involving the same issues was brought, but when pushed to trial by Mr. Beecher's counsel, was discontinued, the plaintiff paying all costs. The largest Congregational council ever convened, which included representative men from all sections of the country, and all schools of thought, after a week spent in thorough scrutinizing inquiry, in the course of which Mr. Beecher was himself submitted to a searching cross-fire of questions from the members of the council in an open session, extended to him, without a dissenting voice, the Christian fellowship and sympathy of the churches, and expressed the confidence of the entire council in his integrity. What is known as the great scandal has already drifted with other scandals into the past, and in the future will be no more remembered against the memory of Mr. Beecher than the somewhat analogous episode in the history of John Wesley.

In the spring of 1887, Mr. Beecher was

laboring with exceptional vigor even for himself, adding to his preaching the labors of literary work in the completion of his long-delayed "Life of Christ," which he purposed to follow with an autobiography. On the 2d of March he experienced what at first appeared to be a severe bilious attack, but proved to be apoplexy, under the effects of which he fell into a deep sleep, and so painlessly passed away, dying on Tuesday morning March 8, at half-past nine o'clock in the morning, without a struggle. His wife, three sons, and one daughter survive him. No death ever produced more wide-spread expressions of sorrow throughout the American nation. In pulpits representing every school of thought sermons on his career and character were delivered; in all sorts of organizations, religious and secular, resolutions to his memory were passed; in every kind of journal, from "Turf and Field," to the distinctively religious organs, there was some recognition of his services to this generation. The public exercises held in Plymouth Church the Sunday evening after his death, in which Unitarian, Presbyterian, Lutheran, Swedenborgian, Universalist, Methodist, Baptist, Jewish rabbi, Reformed Dutch, Episcopalian, Congregationalist, Roman Catholic, all took part, were typical of the universality of respect expressed throughout the country, transcending all bonds of sect and party.

Mr. Beecher's genius was distinctively that of an orator. He showed no power in executive or administrative functions. As an editor, he shaped and inspired the journals with which he was connected, but never administered them; as a preacher and pastor he filled his audience with his never-failing enthusiasm, but did not attempt to allot to them individual work; as a public reformer, he touched the hearts and consciences of the nation, but took no part in the administration of either political, moral, or missionary organizations. But as a preacher, whether measured by the power of his utterances, or by the variety of his pulpit themes, he was certainly without a peer in the American pulpit, and probably without a superior in the history of the Christian Church. He was an omnivorous reader. Whatever interested humanity interested him. His library of twenty-five hundred or three thousand volumes embraced representatives of every phase of literature, from technical treatises on medicine, theology, and the various arts, to rare editions of the best English classics; but he was a reader rather than a scholar, and on doubtful and debated points, was accustomed to take as conclusive the opinions of experts. At the same time, he familiarized himself with the great principles involved in the public discussions in which he took a part; and during the anti-slavery discussions "Kent's Commentaries," and "Curtis on the Constitution," stood side by side with the commentaries of Meyer and Alford on his library

shelves. Theologically he belonged to that broad school which is represented in England by the names of Erskine, Maurice, Robertson, Stanley. The truths on which he laid the greatest emphasis were, that God is the father of the whole human race; that he is manifested historically in the person of Jesus Christ; that he is immanent in the hearts and lives of all who will receive him; that the Bible is a record of an inspiration which has been by no means confined either to the epochs or to the people with which it deals; and that, under the direct and immediate influence of the spirit of God, the human race has from the beginning made, and still is making, steady progress toward that consummation of liberty and life, which is the kingdom of God, and which when God's purposes are accomplished will embrace the whole sentient universe. Several biographies have been given to the public since Mr. Beecher's death; the two that possess the largest measure of authority are one, the materials for which were gathered by the Rev. S. B. Halliday, the pastoral helper of Plymouth Church, which was published with Mr. Beecher's sanction during his lifetime; and one now in course of preparation, prepared by his widow, his son William C. Beecher, and his son-in-law, the Rev. Samuel Scoville, which will contain a large amount of autobiographical material gathered from his letters and his various addresses.

Mr. Beecher's publications include: "Lectures to Young Men on Various Important Subjects" (Indianapolis, 1844, revised edition, New York, 1850); "Star Papers; or, Experiences of Art and Nature" (1855); "New Star Papers; or Views and Experiences of Religious Subjects" (1858); "Freedom and War: Discourses suggested by the Times" (Boston, 1863); "Eyes and Ears" (1864); "Aids to Prayer" (New York, 1864); "Norwood; or, Village Life in New England" (1867); "Overture of Angels" (1869), being an introductory installment of "Life of Jesus the Christ: Earlier Scenes" (1871); "Lecture-Room Talks: A Series of Familiar Discourses on Themes of Christian Experience" (1870); "Yale Lectures on Preaching" (3 volumes, 1872-'74); "A Summer Parish: Sermons and Morning Services of Prayer" (1874); "Evolution and Religion" (1885); Also, numerous addresses and separate sermons, such as "Army of the Republic" (1878); "The Strike and its Lessons" (1878); "Doctrinal Beliefs and Unbeliefs" (1882); "Commemorative Discourse on Wendell Phillips" (1884); "A Circuit of the Continent" (1884); and "Letter to the Soldiers and Sailors" (1886, reprinted with introduction, 1884). He has edited "Plymouth Collection of Hymns and Tunes" (New York, 1855), and "Revival Hymns" (Boston, 1858). Numerous compilations of his utterances have been prepared, among which are: "Life Thoughts," by Edna Dean Proctor (New York, 1859); "Notes from Plymouth Pulpit," by

Augusta Moore, (1859); "Pulpit Pungencies" (1866); "Royal Truths" (Boston, 1866), reprinted from a series of extracts prepared in England without his knowledge; "Prayers from Plymouth Pulpit" (New York, 1867); "Sermons by Henry Ward Beecher: Selected from Published and Unpublished Discourses," edited by Lyman Abbott (2 volumes, 1868); "Morning and Evening Devotional Exercises," edited by Lyman Abbott (1870); and "Comforting Thoughts" (1884), by Irene Ovington.

BELGIUM, a constitutional monarchy in Western Europe. The Legislature is composed of a Senate and a House of Representatives. The Chambers meet annually in November, and sit for at least forty days. The members of both Chambers are elected under a property qualification, which excludes twelve thirteenths of the citizens from the voting franchise. The House is composed of 188 members, elected for four years; the Senate of half that number, elected for eight years. The present ministry was appointed on Oct. 26, 1884, and is composed as follows: President of the Council and Minister of Finance, A. Beernaert; Minister of Justice, J. Devolder; Minister of the Interior and of Instruction, J. Thonissen; Minister of War, Gen. C. Pontus; Minister of Railways, Posts, and Telegraphs, J. H. P. Vandenpeereboom; Minister of Foreign Affairs, Prince de Chimay; Minister of Agriculture, Industry, and Public Works, Chevalier A. de Moreau.

Area and Population.—The area of the kingdom is 11,378 square miles. The population on Dec. 31, 1885, was estimated at 5,853,278 persons, of whom 2,923,902 were males and 2,929,376 females. The population of the principal cities at that date was as follows: Brussels, with suburbs, 416,659; Antwerp, 198,174; Ghent, 143,242; Liège, 135,371. The number of births in 1885 was 175,048; of deaths, 117,775; of marriages, 39,910; increase of population, 57,268. The net immigration during the year was 5,075.

The Army.—The army is recruited by conscription and voluntary enlistment. Every Belgian of the age of twenty is liable to service, but substitution is allowed. The legal period of service is eight years, but the men are not usually required to serve more than a third of that time. The peace effective provided for in the budget of 1887 is as follows:

DESCRIPTION OF TROOPS.	Officers.	Men.	Total.
Infantry	1,838	23,611	30,499
Cavalry	863	5,630	6,493
Artillery	569	7,861	8,370
Engineers	89	1,390	1,479
Administration troops ..	74	890	964
Total	2,998	44,382	47,290

The war strength of the army is 103,860 officers and men, 13,800 horses, and 240 guns. There is besides a civic guard, which in 1885 numbered 34,597 men, and the gendarmerie, consisting of 2,084 men with 1,379 horses.

Fortification of the Valley of the Meuse.—During

the war panic in the early part of 1887, when it seemed probable that war would break out before long between France and Germany, the old question of frontier fortifications became an urgent one. Strong hints were received from England, when the sentiments of that country were probed in regard to defending the neutrality of Belgium, that the Belgians could not look for military assistance from that quarter, notwithstanding the international guarantee of the treaty of 1839. The ministry determined on fortifying the Meuse valley and increasing the army. A committee of the Chamber found Gen. Brialmont, Inspector-General of Fortresses, Nicaise, Inspector-General of Artillery, Wouvermans, in charge of the works at Antwerp, Vandersmissen, Commander of the First Military Circumscription, and nine other general officers who were consulted, all in favor of a first line of fortifications in the valley of the Meuse. The Catholic majority opposed augmenting the army by the introduction of universal obligatory military service. Military authorities were found who asserted that the army was sufficiently numerous to man the new forts, proposed in the plan of Gen. Brialmont, and the central citadel at Antwerp with its chain of outlying forts, and still leave a considerable force to maneuver in the field. M. Frère-Orban, supported by other military experts, opposed, not the principle, but the expediency of the projected fortifications, and insisted on the importance of maintaining a large field army. The Government did not abandon the idea of a central fortress for the army to fall back upon, as provided in the plan of 1857, but proposed to strengthen the works in and around Antwerp. The fortification project was adopted by the Chamber on June 14 by a vote of 81 to 42. The forts will be able to resist the new explosives. Their cost was originally estimated at 24,000,000 francs, but it will exceed that figure. To arm and provision them will cost 5,500,000 francs. It was also decided to provide the infantry with a new rifle at an expense of 11,000,000 francs; also to complete the outlying defenses of Antwerp, consisting of a line of forts extending to the Nethe River on one side and to the Senne on the other, which will be a work of four years. The Meuse fortifications were begun, under the direction of Col. Kebers, on August 15, but are hardly expected to be in condition for effective defensive operations before the summer of 1889. Six large and six small forts are to be built at Liège, and five large and four small ones at Namur, while Huy is to be made a fortified post. The plan for the disposition of the available military forces is as follows: army of campaign, 67,782 men; Antwerp garrison, with a flying column 12,000 strong, 85,785; at Termonde, 4,796; at Diest, 2,594; at Liège, 8,997; at Namur, 5,124; at Huy, 541; depot troops and territorial gendarmerie, 5,422; total, 129,191 men. The ministry claim that they can mobilize 100,000 troops in the first

Edm Duchen

line and a reserve of 80,000, while the opposition leader asserts that a mobilization would not produce more than 80,000 men. Of 26 bridges across the Meuse only seven remain unprotected by the new fortifications; and of 19 railroads only three, and two of these lead from Holland. With the protection of the *têtes-de-pont* of Liège and Namur, the Belgians expect to be able to reach without danger any point where an invading army should attempt to cross the river, and resist the passage or force the invaders to detach large forces and delay their march until troops could arrive from France or Germany.

Commerce.—The general commerce in 1884 amounted to 5,450,200,000 francs. The special commerce consisted of 1,425,700,000 francs of imports and 1,337,500,000 francs of exports. The chief articles of import were breadstuffs of the value of 275,007,000 francs; wool and woolsens, 101,479,000 francs; metals and minerals, 99,636,000 francs; textile fabrics, 90,149,000 francs; hides and skins, 73,693,000 francs; live animals, 63,118,000 francs; oil-seeds, 47,666,000 francs; cotton, 52,743,000 francs; timber, 45,807,000 francs; coffee and sugar, 31,583,000 francs; chemicals, 38,076,000 francs; butter, 21,597,000 francs; flax and hemp, 16,227,000 francs. The chief exports were yarns, valued at 181,962,000 francs; breadstuffs, 105,157,000 francs; machinery, 80,353,000 francs; stones, 98,839,000 francs; coal, 76,581,000 francs; wool, 76,481,000 francs; textiles, 70,398,000 francs; hides, 63,368,000 francs; iron, 50,050,000 francs; glass, 48,406,000 francs; zinc, 41,022,000 francs.

France leads in the import trade with 276,858,000 francs, the Netherlands coming next with 187,530,000, and then Germany with 185,423,000, Great Britain with 184,856,000, the United States with 160,673,000, and Russia with 123,878,000 francs. Of the exports 411,964,000 francs went to France, 252,142,000 to Great Britain, 236,240,000 to Germany, 176,205,000 to the Netherlands, and 39,559,000 francs, the next largest amount, to the United States.

Railroads, Posts, and Telegraphs.—The railroads of Belgium have a total length of 4,410 kilometres, or 2,758 miles. There are 3,166 kilometres worked by the state and 1,244 kilometres by companies. The receipts of the state lines in 1885 were 119,772,557 francs, the expenses 70,097,356 francs; the receipts of the companies' lines 37,229,787 francs, the expenses 20,833,582 francs. The capital expended on the state lines up to 1886 was 929,697,462 francs, besides annuities of the capital value of 319,798,631 francs for the purchase of lines already constructed.

The post-office in 1885 transmitted 91,498,150 private letters, 13,917,560 official letters, 26,539,334 postal-cards, 51,473,000 circulars, etc., and 103,559,000 journals. The revenue amounted to 14,393,081 francs and the expenses to 8,609,871 francs.

The length of telegraph lines in 1885 was 3,800 miles, with 17,713 miles of wires; the number of dispatches, 6,807,772; the receipts, 2,666,736 francs; the expenditures, 3,587,659.

Navigation.—Belgium had on Jan. 1, 1885, a commercial navy numbering 64 vessels, of 80,592 tons, including 51 steamers, of 74,667 tons. There were 324 vessels, of 11,474 tons, employed in the fisheries. The aggregate tonnage of vessels entered at Belgian ports during 1884 was 4,072,987, and the total tonnage cleared 4,060,612.

Revenue and Expenditure.—The ordinary receipts of the treasury according to the budget estimates for 1886-'87 amount to 319,625,109 francs, of which 118,897,000 francs represent the railroad receipts, 39,128,000 francs the excise duties, 25,507,100 francs the customs duties, 23,860,000 francs the registration fees, 23,699,700 francs the land-taxes, 19,320,000 francs the succession duties, and 19,100,000 francs the personal taxes. The total ordinary expenditure was estimated at 316,663,411 francs, 102,582,547 francs being the interest on the public debt, 87,245,471 francs the expenses of the railways, posts, and telegraphs, 45,624,100 francs the military budget, and 22,005,421 francs the appropriation for public instruction, etc. The total revenue for 1887-'88 is estimated at 318,661,559, and the expenditure at 307,743,123 francs.

The public debt in 1887 amounted to 1,874,510,824 francs, besides annuities requiring the payment of 12,243,000 francs. The debt was mainly contracted for public works, and large as it is, representing a burden of \$75 *per capita*, the revenue from the railroads alone is more than sufficient to pay the interest.

Cattle Duties.—The Clerical party brought forward in the Chamber a long contemplated protectionist measure imposing high duties on foreign cattle and meat. The Premier himself took strong grounds against the bill. While it was under discussion the price of meat rose 30 per cent. in the retail market. Although meat is too dear a luxury for most Belgian workmen, the proposed law produced a ferment throughout the masses of the people, and when disturbances resulted, the Premier proposed the adjournment of the debate, on the ground that it would be improper to reject the bill as a concession to threats and outrages. The majority were not influenced by the popular excitement, and after adopting an amendment exempting cattle sent through Belgium for re-exportation, carried the bill on May 10 by a vote of 69 to 54, the Premier and the Minister of Railways voting with the minority against their own party. The measure increases the duties on cattle, sheep, and all fresh meat fifty or sixty per cent. The Senate passed it on June 1 by a vote of 36 to 23, after a declaration of the Minister of Agriculture that the ministry would demand the repeal of the duties if any considerable rise in the price of meat resulted. The Chambers also in-

creased the import duty on vinegar, and abolished the stamp-tax on insurance policies.

Labor Strikes.—The vote of the Chamber was the signal for strikes among the workmen all over the country, which had for their object the redress of political grievances. By quitting work the laboring-class not only intended an imposing political demonstration, but expected to force their employers to join them in their demands. Chief among these was universal suffrage, or a wide extension of the franchise. This reform they wished to have immediately accomplished by the dissolution of the Chambers and the convocation of a Constituent Assembly. Another urgent demand was a general amnesty for all who were convicted for offenses connected with the labor disturbances of the year before. The abolition of substitution in the army was also desired, and an income tax instead of duties on consumption, the removal of the high property qualification for the Senate and other reforms were urged. The strikes began in the coal-mines, and spread to the metal-workers of Louvain, Centre, Brussels, and other places, the carpenters, tailors, painters, and other mechanics of Brussels, the quarrymen at Tournai, and the iron-workers in the large foundries of the Seraing, Charleroi, and other districts. Collisions with the gendarmes occurred at La Croyère, where two miners were killed and several wounded; La Louvière, where dynamite was used by the strikers in an attempt to blow up a *café*, and against workmen who would not join them; and Brussels, where dynamite outrages occurred, and where several policemen and rioters were wounded. Later severe collisions between troops and strikers occurred in Ghent, and dynamite outrages were perpetrated in the Centre district and elsewhere. Many agitators, including a French anarchist named Jahn, were arrested. Troops were stationed at Seraing and other places, and two classes of reserves were called out. At Morlanwelz the coal-mine proprietors agreed to unite with their workmen in demanding the adjournment of the cattle-tax project by the Senate, the pardon of the convicted rioters of 1886, and the establishment of councils of conciliation and a laborer's benefit fund. The French authorities closed the frontier within the Department of the Nord, and arrested and conducted to Paris the Belgian socialist leader, de Fuisseaux. Fauvisaux, a noted socialist, was arrested at Quaregnon, and a leader named Loor in the mining districts. After two or three weeks the strikes subsided, and by the 1st of June nearly all had returned to work.

The Progressist and Radical associations in a congress at Brussels on May 29 adopted a programme embodying modification of the senatorial tax qualification, lay education, separation of Church and State, equal military burdens, an income-tax instead of taxes on consumption, responsibility of employers for accidents, councils of arbitration, professional syndicates,

an invalid fund for workmen, the democratic organization of credit, equality of the French and Flemish languages, and the right of voting for all who can read and write. In July the Chamber voted down a proposal for obligatory military service, upon which the Opposition moved a revision of the Constitution for the extension of the electoral franchise. The proposal, which is the third one of the kind since the Constitution was framed, was rejected by 83 votes against 33, all the Liberals voting for it, and all the Clericals in the negative.

Labor Legislation.—A new law for the suppression of drunkenness prescribes the punishment of fine and imprisonment for persons found drunk on the streets and for liquor-sellers who furnish drink to intoxicated persons or to children, and abolishes the right to recover debts incurred in a liquor-shop. An act regulating the payment of workmen's wages provides that two fifths of the pay of workmen and of clerks' salaries, not exceeding 1,200 francs, are inalienable, and one fifth is exempt from seizure by legal process. The Chamber passed a bill, introduced by M. Frère-Orban, instituting councils of industry for the reconciliation of the interests of employers and laborers in cases of conflict. The truck system was abolished by a bill providing for the payment of wages in cash.

Fishery Riots.—Belgian fishermen have for years carried on a warfare against the English steam-trawlers by cutting their nets with grapnels. Finding that their better-equipped competitors were ousting them from their own market, they felt aggrieved because, while foreign fishermen have free access to the Belgian markets, they themselves must pay heavy duties in France, and are excluded from the London market by a combination of middlemen. A British cruiser which was stationed on the fishing-grounds to protect the English boats from piratic outrages was unable to capture the users of the submarine cutting-apparatus; but evidence was produced before Belgian tribunals on which some of the misdemeanants were convicted and fined, a result which further inflamed the minds of the fishing population. The British Government subsequently increased the naval force in the North Sea to five steamers and four sailing cruisers. On August 23, when the crew of three English smacks were landing their cargoes at Ostend a crowd gathered, destroyed a part of the fish, and broke the windows of a proprietor of English fishing-boats. The gendarmerie interfered, and were beaten off, but came again in greater force, and charged the rioters with their bayonets, wounding many of them and killing three. The civic guards were called out, but during the next day fishermen attacked some English smacks in row-boats, and would not leave them in obedience to a formal summons, whereupon the artillery fired, killing two and fatally injuring three. The women took an active part in the disturbances, and

joined in attacks upon porters that were handling English fish.

BIBLE SOCIETIES.—The earliest society for the circulation of the Bible appears to have been the Canstein Bible Society, which was founded at Halle in 1710, by Karl Hillebrand, Marquis of Canstein. The Naval and Military Bible Society existed in London in 1787, for the purpose of furnishing the Scriptures to the navy and army of Great Britain. The Society for the Promotion of Christian Knowledge in London, in 1787, published several thousand copies of the Bible for distribution. A French Bible Society was instituted in London in 1792. The British and Foreign Bible Society was formed in 1804, with the purpose, as declared in its constitution, of adding its endeavors to those employed by other societies for circulating the Scriptures through the British dominions, and also of extending its influence to other countries, "whether Christian, Mohammedan, or Pagan."

American Bible Society.—The first Bible Society in the United States was instituted in Philadelphia, in 1808. The organization of other societies followed, at Hartford, Conn., in 1809, Boston, Mass., New York city, and Princeton, N. J., in the same year, until in 1816, the number of these organizations had risen to between fifty and sixty. The American Bible Society was formed in 1816 by the union of thirty-five of these local institutions, and in the course of the first year of its life added eighty-four societies as auxiliaries. The resolution of organization of this society, expressing the object of the convention at which it was effected, declared that "it is expedient to establish, without delay, a general Bible institution for the circulation of the Holy Scriptures without note or comment." The same provision is embodied in the first article of the constitution of the society, which declares that its "sole object shall be to encourage a wider circulation of the Holy Scriptures, without note or comment." To this, it is added, that "the only copies in the English language to be circulated by this society shall be of the version now in common use." By reason of this provision, the society is not at liberty to circulate the Revised Version of the Scriptures, which has been prepared under the direction of the Convocation of Canterbury. In pursuance of the purpose as further declared, of extending its influence to all countries, whether Christian, Pagan, or Mohammedan, the society publishes versions of the Scriptures in nearly two hundred languages, among which nations and tribes in all quarters of the earth are represented.

The seventy-first annual meeting of the American Bible Society was held in New York city, May 12. The Hon. E. L. Fancher presided. The year's cash receipts of the society for all purposes had been \$493,858, of which \$18,656 had been given for investment. The cash payments had been \$554,490. The receipts were less by \$80,552 than in the previous

year. The invested, or trust funds, of which only the interest was at the disposal of the board of managers, amounted to \$342,750, and had yielded an income of \$11,964. The investments available for general purposes amounted to \$164,691, and had yielded an income of \$11,246. Twenty-six Bible societies had been organized during the year, and recognized as auxiliaries. Progress was reported upon the translation of the Old Testament into the Ponape language; the Muskokee version of the New Testament, which had been completed; a version of the Psalms in Choctaw, which had been accepted and published; the Japanese version, in which all the books had been translated, but were waiting for a final revision; the translation of the Gospels into Kurdish; the revision of the Modern Syriac Old Testament, and typographical correction of the Ancient Syriac New Testament and Psalms; Spanish and Portuguese versions; and the Mandarin, Colloquial, and Classical or Wenli versions in China. The issues from the press in foreign countries had been very large, and included 68,200 Bibles and portions of the Bible in Turkey—in the Turkish, Armenian, and Arabic languages; 856,400 volumes in China; 1,500 copies of the Proverbs in Siam; 2,800 volumes in Japan; and editions at Honolulu, Bremen, and Dorpat (Russia). The whole number of issues for the year, at home and in foreign countries, had been 1,447,270 copies. The missionary and benevolent work of the society included the employment of colporteurs to carry the Bible into destitute neighborhoods, where it is never likely to be brought by the usual channels of trade, and distribution through benevolent societies, and, in foreign countries, through missionary societies. The work of the general supply of the United States had been continued, but not on a scale so extended as in some previous years. Of the auxiliary societies, 824 had made reports, of which 143 were engaged in the canvass of their fields and had employed 155 paid agents. One hundred and fifty-three colporteurs had sold 83,478 copies, and given away 24,659 copies. The combined results of the work of the year were represented by the visitation by the society and its auxiliaries of 639,269 families, of which 71,569 were found without the Scriptures, and 49,908 were supplied; in addition to which, 22,892 individuals were supplied. During the five years in which the work of resupply had been going on, every eighth family visited had been found without a Bible in their home; while nearly 400,000 families had received the book, 150,000 rejected it. The exact numbers were: families visited, 4,468,494; found without the Scriptures, 647,124; supplied, 384,924; individuals supplied in addition, 217,261. The "Table of Foreign Distribution," gave the following summaries: Number of Bibles, Testaments, and portions printed abroad, 482,168; number purchased abroad, 103,360; number issued abroad, 469,665; number sent abroad,

51,691, making a total foreign circulation of 521,356 copies; cash remittances to foreign lands, \$159,986; cash receipts from foreign lands, \$41,611; number of agents and colporteurs employed in the distribution of the Scriptures in foreign lands, 410. The lands in which this work is performed include American and European states, and every country in which Protestant American missionaries labor.

British and Foreign Bible Society.—The eighty-third annual meeting of the British and Foreign Bible Society was held in London, May 4. The Earl of Harrowby presided, and in his address—appropriately to the Queen's Jubilee—gave some comparative statistics respecting the progress of the society during the past fifty years. Fifty years before the income of the society had been £100,000, now it was £225,000; then it had 2,370 auxiliary societies at home, now 5,800; then 260 auxiliary societies abroad, now 1,500. Fifty years ago the annual issues of publications were 600,000 copies, now they are 3,000,000; then the cheapest Bible cost 2 shillings, now it was only 6d.; then the cheapest New Testament cost 10d., now the cheapest was Lord Shaftesbury's 1d. Testament. Fifty years ago the Scriptures were published in 136 languages, now in 280. The full income of the society for the year ending March 31, 1887, amounted to £116,764, and the sum received for Scriptures sold, at home and abroad, was £104,888. These sums, with £104 received on a special account, made a total of receipts of £221,754. The expenditures had been £281,776. The issues for the year had been 3,932,678 copies in Bibles, Testaments, and portions of Scripture. The whole number of issues by the society since its beginning had been 112,258,547. The Queen, at the request of Australian auxiliaries, had written a passage of Scripture—"On earth peace, good will toward men," with the royal autograph, to be placed in fac simile in the Testaments of the school-children of the Australian colonies, as a lasting memorial of the Jubilee year. The income of the society for the year had declined by £81,000.

BOLIVIA, an independent republic of South America. (For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia" for 1888 and 1886.)

Government.—The President of the Republic is Don Gregorio Pacheco. His Cabinet is composed of the following ministers: Foreign Relations, Don Juan Crisóstomo Carrillo, who combines with his office that of Minister of Justice, Public Worship, and Instruction; Finance, Señor García; Interior, Dr. M. M. Dilledina; War, Brigadier-General Don Casto Arguedas.

On April 7 the Bolivian Minister at Washington was recalled, the legation being withdrawn for the present, while the American Minister at La Paz, Hon. William A. Seay, resigned on account of failing health. The Bolivian Consul-General at New York is Don Melchor Abarrio; the Consul at San Francisco,

Don Francisco Herrera, and at New Orleans, Don José P. Macheca; the American Vice-Consul-General at La Paz is Mr. S. Alexander.

Army.—The strength of the regular army is 2,000 men, with eight generals and 1,018 other officers, the annual outlay for the War Department being \$2,000,000.

Finances.—The income of the Government in 1886 was \$2,964,079, but the outlay exceeded it by \$800,000. A concession was granted, near the close of 1886, for a bank at La Paz. The Banco Nacional de Bolivia experienced serious financial distress during the summer of 1887, not being able to pay at sight outstanding notes of its own circulation, even in small amounts. It suspended payment temporarily and telegraphed to Potosi for bar-silver.

Boundary Treaties.—During the autumn of 1886 a preliminary boundary treaty was signed at La Paz by the Peruvian Minister Plenipotentiary and the Bolivian Government, the chief clauses of which were: 1. The present acknowledged limits between the two countries are confirmed, except those southward from Lake Titicaca; 2. The two republics will undertake to negotiate with Chili, if possible, a modification of the treaty of Ancon, so far as it relates to the occupation for ten years of the provinces of Tacna and Arica; 3. Should Chili consent to such modification, Peru and Bolivia are to engage jointly to pay Chili the \$10,000,000 indemnity, offering as a security the national revenues of both countries; 4. Peru agrees to cede to Bolivia the two provinces named against payment by the latter to the former of \$5,000,000; 5. The war expenses of the war on the Pacific, which Peru advanced to Bolivia, are thereby waived by the former. This latter arrangement did away with the debt contracted by Bolivia in virtue of the Reyes Ortiz-Irigoyen protocol of April 15 and June 17, 1879, in which Bolivia bound herself to pay half of the cost of the war, together with the subsidies that Bolivia received from Peru during the Tarapacá and Tacna campaigns.

On Feb. 16, 1887, a treaty was signed between Bolivia and Paraguay, fixing the limits between the two republics on the one hand, and laying down the basis of an agreement facilitating Bolivian navigation down the Paraguay river to the Atlantic, on the other.

Education.—A college is to be founded in the city of Oruro, the number of students not to be fewer than 50, and the annual amount to be spent for instruction to be \$11,130. Don Aniceto Arce undertook in the autumn of 1887 to found at La Paz a college on a grand scale.

The Fugitive Jesuits.—The Jesuits expelled from Peru found their way to La Paz, where they settled comfortably; but a strong opposition to their stay arose during the autumn of 1887, on the strength of a previous decree of expulsion issued in Bolivia by Marshal Sucre.

Railroads.—In November, 1886, Dr. Antonio Quijarro, ex-Minister of State in the Campero administration, returned to La Paz from Buenos

Ayres, whither he had gone in furtherance of the project for a railway from a port of Paraguay river *via* Oruro to the heart of Bolivia.

The Huanchaca Company of Bolivia acquired, in the spring, 1887, the Antofagasta railroad, paying the Nitrate Company \$3,000,000 for it. This railroad from Antofagasta into the interior was completed during the summer as far as El Añil, while work was pushed as far as the Poruña mountains near Santa Bárbara.

The La Paz city authorities granted a concession to introduce a system of tramways.

Public Works.—The Committee on Roads and Telegraphs in the Department of La Paz was actively at work in the spring of 1887 to push to completion the Obrajes and Vizcachain bridges and the wagon-road from La Paz to Oruro, ready as far as Licasica.

New Route.—In May, 1886, the President issued a decree for the opening of a new route intended to give Bolivia an outlet toward the Atlantic down the Paraguay and La Plata rivers, so that when completed the time separating Sucre and Santa Cruz in the center of Bolivia from Buenos Ayres shall be reduced to a fortnight. The new route, beginning at Bahía Negra, traverses the northern Chaco of Bolivia to a place called Carumby, where it forks, and one of its branches penetrates to Santa Cruz and Port Higueroles in the Department of Beni, while the other puts in communication Sucre with Potosí, Huanchaca, Tarija, and Cochabamba. From Sucre to Cobija and Antofagasta the distance is 655 miles, and from Sucre to Puerto Pacheco, on the western bank of Paraguay river, the distance is 580 miles. The Atlantic route will be preferable to the Pacific, as the former does away with the long circuit *via* the Straits of Magellan or around Cape Horn, and besides, the Chaco route is destined to link the tributaries of the Amazon to the Rio de la Plata.

Telegraphs.—In November, 1886, it was resolved to lay a telegraph line between Huanchaca and Ascotan, ultimately to be extended to Calama and Antofagasta. Simultaneously telegraphic communication was opened between Camargo and Potosí. In September, 1887, communication was opened between Bolivia and Chili by means of the Huanchaca Company's line. Telephonic communication was opened at La Paz in May, 1887.

Agriculture.—Bolivia produces all the fruits and vegetables of Europe, while the sugar-cane flourishes on the banks of Paraguay river, and cotton in the Department of Santa Cruz. The coffee from Yungas in the Department of La Paz is celebrated for its flavor. Both tobacco and cocoa are raised. The export of coca-leaves is likely to fall off somewhat, since a beginning has been made with shipping crude cocaine instead to consuming countries. Handsome green coca-leaves were becoming scarce in Europe in consequence. In the Department of Beni, where grazing is also successfully carried on and cattle-farming is extensive, the

gathering and preparing of India-rubber has become an important pursuit, no fewer than eighteen establishments being devoted to it. The traveler, Edward R. Heath, who visited that region in 1881, and explored the Beni river to its junction with the Mamoré, reports that India-rubber trees abound on the banks of Beni river from the Madidi to the Madeira, there being from 500 to 1,000 trees to the square league, and at some points as many as 8,000. At some points toward the south the depth of forests containing rubber-trees is from one to three leagues from the river-banks inland. In the summer of 1887 an immense number of rubber-trees was reported to have been discovered beyond the Carabaya valley.

Cinchona-Bark.—Since 1876 quinquina plantations or "quinales" have steadily gained in extent in the eastern regions of the Andes, spreading over half a dozen districts—Yungas, Songo, Mapi, Guanay, Camata, and Caupolicán—there being, by latest accounts, 3,842,000 trees yielding bark in those districts, 3,000,000 of which are in the Mapi district alone. Adding thereto the new plantations at Challana, the total in bearing may be set down at 4,000,000. Most of the trees are from five to ten years old, and represent in the aggregate an estimated value of \$20,000,000. Europe and America are, however, receiving large amounts of quinine-bark from Ceylon, Java, Jamaica, Venezuela, Mexico, and Western Africa, and the value in the world's markets has been drooping of late, as shown by the import into England during the first seven months of 1887, which was 94,748 cwt., worth £455,951, against 87,048 of the value of £505,430 during the corresponding period of 1886, and 69,678 cwt., representing a value of £491,428, in 1885.

Precious Metals.—Bolivia holds the third rank among the silver-producing countries of the world, and its production is believed to be susceptible of a notable increase, so soon as railroads facilitate and cheapen the transportation of machinery and material. But in spite of obstacles in the way of transportation, the mining industry has made steady headway in Bolivia. Even while the war on the Pacific lasted \$20,000,000 was invested in new mining enterprises, and all this money was raised in the country.

During the summer of 1887 two Americans, James Lynch and John Araya, discovered rich gold placer-mines on the banks of Cielo Aguiria river, in the Songo district. At the depth of a yard and a half the auriferous sand yields 2.35 grains per 12 quintals of sand. Machinery, etc., was to be conveyed thither to undertake gold-washing on a large scale.

Nitrate.—Extensive deposits of nitrate of soda were discovered in the spring of 1887 at Zapa, by an Italian, who forthwith went to Europe for the formation of a company.

Indian Troubles.—There have been repeated risings of Indians in several localities, at Izozo, San Lorenzo del Secure, and on the banks of

the Blanco and Beni rivers. In June a picket-guard sent to the Department of Beni were cut off by them. The soldiers, who had packed their rifles in a cart drawn by Indians, were suddenly attacked and killed, with the exception of a few who reached a small chapel. Here they defended themselves for three days, and finally, when their ammunition was exhausted, endeavored to escape during the night, but were overtaken and clubbed to death. On receiving particulars of this disaster, the prefect sent seven missionaries to the Indians. Of these seven two joined the Indians, four were allowed to return after they had sworn to assist the insurrectionary cause, and the seventh was barbarously murdered. The Government later in the year sent a new prefect to Beni to endeavor to suppress the Indians, who continued in open revolt. Three more tribes joined the movement, and it was apprehended that if the Government did not display greater promptness and energy, all the settlements in Beni would be destroyed.

BRASSEY, Lady ANNIE, an English traveler and author, born in London about 1840, died at sea, Sept. 14, 1887. She was a daughter of John Allnutt, a man well known as a steeplechase rider, from whom she inherited a passion for riding and out-door sports. In 1860 she mar-

ried Thomas Brassey, who was one of the two sons of Thomas Brassey the railway-builder, and inherited half of his immense fortune. Mr. Brassey was a member of Parliament for Hastings, was knighted in 1881, and in 1886 was raised to the peerage as Baron Brassey. He is a Liberal in politics. For several years he has owned a whole fleet of yachts, which he is able to navigate himself, and he and his wife were fond of making long voyages. Her first printed work was "The Flight of the Meteor," an account of two cruises in the Mediterranean and travels in the East (for private distribution only). In 1872 she published "A Voyage in the Eothen," which described their visit to the United States and Canada. In 1876-'77 they made a voyage round the world in their yacht "Sunbeam," crossing the Atlantic from the English Channel to the coast of Brazil, thence around South America, passing through the Straits of Magellan, across the Pacific to Japan, China, and India, and home again by way of the Suez Canal and the Mediterranean. Her account of this voyage, published in London in 1878, had an immediate success, was republished in New York, and seemed to bring her to the familiar acquaintance of large numbers of American readers. It has appeared in several editions, including one to be used as a school reader and one priced at sixpence, which had a very large circulation. In 1880 she published "Sunshine and Storm in the East—a cruise to Cyprus and Constantinople," and in 1888 "In the Trades, the Tropics, and the Roaring Forties." In 1885 Mr. Gladstone accompanied the Brasseys in a trip on board one of their yachts to the coast of Norway. The home of the Brasseys is Normanhurst Castle, near Hastings, Sussex, and Lady Brassey was prominent in many charitable undertakings there and in London. A personal friend writes: "Lady Brassey was a woman of extreme energy; there was nothing she disliked more than to have no immediate object of action before her. So long as she was in health she wished to be up and doing something tangible. She was an active member of the St. John's Ambulance Association, and assisted in forming sundry classes or centers thereof. She passed the South Kensington School of Cookery (scullery department and all), and took a first-class certificate therein; she was a Dame of the Order of St. John of Jerusalem in England. Few ladies of the fashionable world get through as much effort in a week as Lady Brassey often incurred in a single day. We have known her spend a day at Normanhurst thus (as a sample): Correct proof-sheets for printer and interview head servants as to orders for the day before breakfast; hunting with the local harriers for three hours, riding straight as a die over the stiff timber fences of Pevensey Marshes; home to a late luncheon; then drive a waggonette to show some visitors the beauties of the neighboring Ashburnham Park; after afternoon tea an overhauling of fancy costumes for an approaching fancy-dress ball; after dinner a rehearsal of some fancy-dress quadrilles with the various young ladies and gentlemen who were to form her party to the said ball on the morrow. Or, as an illustration of a day in the London season: Down to Chatham (or some such port) in the morning to launch a vessel; to the East End in the afternoon to distribute prizes at a training-ship, and to make a speech to the pupils; and in the evening a reception at her own house." Lord and Lady Brassey were on board the "Sunbeam" with their son and their

LADY ANNIE BRASSEY.

ried Thomas Brassey, who was one of the two sons of Thomas Brassey the railway-builder, and inherited half of his immense fortune. daughters, sailing from Port Darwin, North Australia, for the Cape of Good Hope, when Lady Brassay died of a fever. They were a thousand miles from land, and her body was buried at sea.

BRAZIL. (For details relating to area, territorial divisions, population, etc., see "Annual Cyclopædia" for 1884.)

Government.—The Emperor is Dom Pedro II, born Dec. 2, 1825. The Emperor went to Europe on June 30 for his health, and his daughter, Donna Yzabel, Countess d'Eu, born July 29, 1846, was installed Princess-Regent during his absence. Her Cabinet is composed of the following ministers: President of the Council of Ministers and Minister of Foreign Affairs, Counsellor of State, Senator Baron de Cotegipe; Interior, Senator Baron de Mamoré; Finance, Senator Francisco Belisario Soares de Souza; Justice, Deputy Wallace McDowell; Navy, Deputy Carlos Frederico Castrioto; War, Senator Joaquin Delfino Ribeiro da Luz; Agriculture, Commerce, and Public Works, Rodrigo Augusto da Silva.

The Brazilian Minister at Washington is Baron de Itajubá. The Consul-General of Brazil at New York is Dr. Salvador Mendonça. The American Minister at Rio de Janeiro is Hon. Thomas J. Jarvis; the Consul-General, H. Clay Armstrong.

Finances.—The entire indebtedness of the Government up to March 31, 1887, for the home debt, and up to Dec. 31, 1886, for the foreign debt, was 987,391,610 milreis. Of this amount, 256,951,000 milreis, or £28,552,500, are under the head of gold loans, negotiated in London; 72,209,000 milreis under that of the two internal loans; and 882,608,000 milreis under that of internal consolidated indebtedness in currency, 91,286,000 being besides the floating debt, and 184,355,000 milreis paper money in circulation. The internal consolidated debt consists mainly of five-per-cent. "apolices," or bonds, of which 881,476,000 milreis are in circulation. Of the foreign debt, £6,430,000 represent the loan negotiated in 1886.

According to the report of the Minister of Finance, submitted to Parliament during the summer of 1887, the income during the fiscal year 1885-'86 was 124,328,000 milreis, and the outlay 149,774,000. Until then the budget covered the period from June 30 to July 1; but by the law of Oct. 16, 1886, the financial year is to run from Jan. 1 to Dec. 31. This being the case, 1887 will cover 18 months, and the budget estimate is 202,168,000 milreis revenue and 229,927,000 expenditure.

Army.—The parliamentary vote relating to the army in 1887 maintains its strength at 13,500 men in time of peace. Should unforeseen events arise it may be increased to 30,000. There are 800 cadets in the various military schools. The army is recruited by voluntary enrolment. Besides a premium, those entering the military service are entitled to 109 square metres of public land.

Postal Service.—During the fiscal year 1885-'86 the receipts, reduced to American money, reached \$950,000, against \$875,000 in 1884-'85, being an increase of \$75,000. The expenses exceeded the previous year by \$45,000.

Telegraphs.—In 1887 there were in operation 10,610 kilometres of Government telegraphs, with 18,812 kilometres of wire, the service being done by 171 offices. The service includes 25 kilometres of cable.

Direct cable communication was established in 1887 between Pará and New York by the Pedro Segundo American Telegraph and Cable Company. The company entered into a combination with La Compagnie télégraphique des Antilles, a French corporation, the better to accomplish the objects for which the company was formed. In this manner the exclusive concession was obtained of laying a cable between Cayenne in French Guiana and Brazil, and an exclusive contract for the interchange of business with all the Brazilian land telegraph lines. The French Government guarantees the company a subsidy of \$200,000 a year.

Lotteries.—The amount of money invested in lotteries by the people of Brazil in 1886 was \$9,140,000, not including the province of Pará, from which returns have not yet been received. Out of this amount, \$6,889,000 was paid to holders of lucky tickets, resulting in a loss to the gambling public of \$2,251,000. This loss has been sustained almost wholly by the population of Rio de Janeiro, where not only the tickets of lotteries, authorized by the General Government are sold, but also those drawn in the remotest provinces. The concessions to hold lotteries are given for the benefit of public works and charities, but the profits of the *concessionnaires* in the provinces often largely exceed the money accruing to the institutions. Thus, in 1866, the profits made by *concessionnaires* amounted to \$1,098,200, out of which the institutions to be benefited received only \$670,400. This contrivance has at length provoked interference on the part of the Minister of Finance, who recommends that Parliament pass a law reforming completely the present system of granting lottery concessions.

Commerce.—On June 22, 1887, the Minister of Finance issued the decree giving effect to the new tariff to go into force on the 1st of July. The alterations from the tariff of 1879 are numerous, the valuations of the 1,104 articles having been revised, mostly in the direction of elevation, and the rates of the duties raised on most manufactured articles from 8 to 15 per cent.

The foreign trade movement in Brazil, including specie and bullion, in milreis, was as follows:

	Import.	Export.
1884-'85.....	178,481,000	224,206,654
1885-'86.....	197,501,500	194,961,619

and the home trade was, coastwise, import and export combined, as follows: 1884-'85, 137,552,500; 1885-'86, 136,796,600.

The value of exports from Brazil is represented by the following amounts in thousands of milreis:

ARTICLES.	FISCAL YEARS.	
	1883-'84.	1884-'85.
Coffee	180,082.7	152,488.5
Sugar	89,181.6	80,029.7
India-rubber	9,459.5	10,628.0
Cotton	12.8	10,944.2
Tobacco	4,767.9	6,759.2
Hides	4,408.2	5,189.8
Cocoa	2,387.7	2,374.9
Brazil-nuts	1,885.4	1,800.2
Gold-dust	1,195.9	1,387.6
Horse-hair	943.8	896.2
Diamonds	1,287.6	642.8
Paraguay tea	884.2	688.5

Coffee shipments from the two leading Brazilian ports, Rio de Janeiro and Santos, were as follows, during the twelve months from July 1 to June 30:

TO—	1886-'87.	1885-'86.
	Bag.	Bag.
Europe	8,110,000	2,224,366
United States	2,643,000	2,924,816
Other countries	185,000	121,681
Total	5,898,000	5,272,863

The sugar and cotton exportation from Pernambuco have been as follows:

YEARS.	Sugar.	Cotton.
	Tons.	Tons.
1884	187,808	9,530
1885	118,959	10,595
1886	106,797	18,234

The export of cotton-seed amounted in 1886 to 2,175 tons. During the first six months of 1887 the export of India-rubber from Pará amounted to 6,381 tons, of which 2,810 tons went to Liverpool, 289 to Havre, and 3,282 to New York. The India-rubber crop of the fiscal year 1886-'87 yielded 18,390 tons, being 390 in excess of the previous fiscal year.

Maté Exportation.—The export of maté, or Paraguay tea, from Brazil, is assuming large proportions. The movement from these provinces was as follows:

FROM—	Kilogrammes.	Value in American money.
Paraná	16,600,000	\$1,800,000
Santa Catharina	2,584,954	212,000
Rio Grande do Sul	604,147	48,000
Total	20,189,101	\$1,560,000

The annual average export of the preceding three seasons was only 12,440,000 kilogrammes, worth \$712,000.

The American trade with Brazil exhibits these figures:

FISCAL YEAR.	From the United States to Brazil.	From Brazil to the United States.
1885	\$7,258,085	\$45,268,660
1886	6,480,789	41,907,532
1887	8,071,658	52,959,176

Coffee.—In May, 1879, Dr. Martinho Prado bought a coffee-plantation at Ribeirão Preto, in the province of São Paulo, then only having 20,000 coffee-shrubs on it, and there organized free labor. In 1886 and 1887 the same estate produced between 900,000 and 1,600,000 kilogrammes of coffee per annum. The men employed number 1,000, and are for the most part Italians.

Trade-Marks.—During 1886 the "Junta Commercial," of Rio, registered 139 industrial and 72 commercial trade-marks, together 211, of which 126 were entered by Brazilians and 85 by foreigners. Of the latter 28 came from England, 27 from France, 8 from the United States, 4 from Germany, 8 from Italy, 8 from Portugal, and from Switzerland and Holland one each.

Railroads.—On May 1, 1887, there were in operation in Brazil 7,929 kilometres of railway, 1,832 kilometres thereof being the property of the Government. There were 1,631 kilometres building, and additional concessions for 3,656 kilometres had been granted. During the first four months of 1887, 280 kilometres were thrown open to traffic. The Brazilian railroad system is in part the property of the General Government, partially of provinces and partially of Brazilian and English companies, only one company being French. The Minister of Public Works has adopted and submitted to Parliament the plan of his predecessor in office to complete the Brazilian railroad system. As the latter exists at present, most of the lines run from the coast in a westerly direction inland. The Prado plan proposes to fill certain gaps from the north southward, and to use, wherever feasible, the navigable rivers, so that, when the extensions and branch lines shall have been built, there will be communication by rail and water between the northern and southern extremities of the empire.

The five tramway lines of the city of Rio conveyed in 1886 altogether 40,496,000 passengers, being at the rate of 111,000 a day, or about one third of the population of the capital. There are also three suburban lines which, in 1886, conveyed 155,000 passengers.

The apparatus and rolling-stock for an electric tramway is expected at Rio. The trials made with it at Brussels proved entirely successful. Accumulators of the Julien patent are used; the speed will be 18 kilometres an hour, and each car is to convey 50 passengers.

The Princess-Regent, on July 2, opened the exhibition of Brazilian railroads.

Steamer Lines.—The Government subsidizes 14 steamship lines, one of which plies between Rio de Janeiro and New York. The Government aid extended to the 14 lines named involved, in 1886, an expenditure of \$719,000.

Lighthouses.—Brazil possessed, early in 1887, 59 lighthouses; one of them inland on the Amazon river. The finest of them is on Raza Island, at the entrance to the Bay of Rio de Janeiro, measuring 96 metres in height, and

its light being visible at a distance of 24 miles. It has an electric light.

Emancipation.—The census completed throughout Brazil on March 30, 1887, showed that there are now fewer than 700,000 slaves in the whole empire. On March 31, 1873, 1,530,000 were still registered. Deputy Alfonso Celso consequently introduced, during the summer, a bill for immediate emancipation, the fate of which remains uncertain, there being considerable opposition to its passage among conservatives and slave-holders.

Immigration.—The number of immigrants landed in 1886 at Rio, was 22,286, of the following nationalities:

Italians	11,554	Poles	146
Portuguese	6,287	British subjects	98
Germans	1,718	Other nationalities	464
Spaniards	1,189		
Austrians	644	Total	22,286
Frenchmen	318		

There were 7,439 that remained at Rio permanently, while 14,847 left for the provinces. At the same time 7,503 third-class passengers went abroad, so that the net gain of population by immigration amounted to 16,975.

The Government made a contract for the introduction in 1887 of 5,000 immigrants from Northern Europe at reduced rates of passage from either Hamburg, Bremen, or Antwerp to either Rio or Santos, the maximum passage money for adults to be 60 marks; for children between the ages of 8 and 12, 30 marks; and 15 marks for children between 3 and 8 years. To certain immigrants the Government will grant a free passage. The steamers employed will enjoy all the privileges of mail-steamers.

Penal Settlement.—Brazilian convicts are sent to the island of Fernando de Noronha, in the province of Pernambuco, if condemned to hard labor. Besides the convicts there is a free population consisting of Government officers, soldiers, and their families. There were 3,955 inhabitants on the island in 1887, 1,434 of them being convicts.

Various Industries.—A coal-mine of considerable depth and extent was discovered early in 1887 in the municipality of Santa Clara, province of São Paulo. The chief coal-deposits in Brazil are those of Tubarão, in the province of Santa Catharina, and of the Arroyo dos Ratos, Rio Grande do Sul, the latter producing 6,000 tons a month, and being the property of an English company. Its product is consumed in the province. The company is extracting coal from two shafts and 32 galleries, and employs 100 miners, who, with the aid of powerful machinery, are capable of taking out 250 tons of coal a day. The "briquette" and washing-works are furnished with two steam-engines, of 120 horse-power each, and can turn out 60 tons of washed coal and 70 tons of brick-coal daily. A railroad of 17 kilometres connects the mine with the navigable Jacuhy river. A Brazilian company owns besides a large mine of bituminous peat at Taubaté in Parahyba, said to be very profitable.

There are in the province of Minas-Geraes 110 iron-works, occupying 1,100 workmen; an industry capable of considerable development, in view of the extensive iron-ore deposits in the Espinhaço mountains, estimated to contain 2,000,000,000 cubic metres of ore.

There were in operation in Brazil, in 1887, 62 cotton-spinneries and weaving-factories, with 5,084 horse-power, and 5,712 looms; the number of yards of cotton fabrics turned out being 48,175,000, representing a value of \$8,400,000. Fourteen of the concerns were in Minas-Geraes, with a joint capital of \$1,600,000, 13 in São Paulo, 12 in Bahia, 9 in the province of Rio de Janeiro, and 6 in the city of Rio de Janeiro.

There are in operation in Brazil 52 central sugar-houses, 33 of which have the interest on their capital (\$10,900,000) guaranteed by the Government. They are distributed very unequally, 22 of them, as follows: Pernambuco, 11; Bahia, 6, and Rio de Janeiro, 5. The guaranteed interest is 6 per cent. in most cases; a few receive 7 per cent. because the capital in each case amounts to \$1,200,000.

English capitalists propose building flour-mills in Rio de Janeiro, and, under concessions from the Government, they intend to import wheat from the Argentine Republic free of duty. This would create a competition with American flour now so extensively consumed in the empire.

The province of Rio Grande do Sul has taken the necessary steps to introduce the growing of wheat on a large scale. A hundred families of wheat-growing peasants, procured in Europe, were landed at Pelotas. Ninety years ago wheat was cultivated successfully in the province, but when the rust appeared this branch of culture was abandoned.

The municipality of Itatiba, in the province of São Paulo, produced, in 1887, 160 pipes of wine, or 768 hectolitres, one of the viticulturists alone turning out 550 hectolitres. Viticulture is rapidly on the increase in the locality, giving returns as remunerative as coffee at present high prices, and requiring but half the number of field-hands.

The raising of cattle and breeding of horses is one of the principal pursuits in the province of Rio Grande do Sul. On a single *estancia*, that of the Curral das Pedras, there are 30,000 head of cattle, 4,500 mares, 2,000 stallions, and 3,000 sheep. The *estancia* is divided into seven farms. Vines and European fruits are also cultivated. Only whites and freedmen are employed, the number of hands being 75.

New Plants.—There grows abundantly and spontaneously in the province of Ceará a plant of the *Malva* kind, whose botanical name is *Oreana lubata*, hitherto looked upon as a mere weed of no commercial value. It has recently been discovered that, with a very simple treatment, not involving much expense, it can be made to furnish a valuable textile fiber, having properties akin to those of the jute of British

India. European manufacturers have begun to order large quantities of the dried plant, one French firm alone receiving 890 bales of it.

Early in 1887 two valuable new plants were discovered in the municipality of Jaboticabal in the province of São Paulo. One belongs to the family of *Euphorbiaceae*, and furnishes India-rubber; while the other belongs to the family of *Frazinelea*, the resinous secretions from which resemble the Italian manna.

Explorations.—Two Brazilian engineers, Dr. Paulo de Frontin and Dr. Julio Paranaguá, explored during the summer the Rio das Velhas, one of the chief tributaries of the San Francisco river, and its basin. The Rio das Velhas through the greater portion of its course is obstructed by waterfalls and rapids, 200 of which the explorers passed in a canoe during the nine days of their navigation to a point where the Velhas flows into the San Francisco. The object of the trip was to ascertain whether by means of a series of blastings these obstacles could not be removed. In March, 1887, the members of a German scientific exploring expedition arrived at Rio, intending to explore the Xingú river, a tributary of the Amazon. See "Brazil," by C. O. Andrews (New York, 1887).

BUFFALO, OR BISON, EXTERMINATION OF THE. At the conclusion of the civil war in 1865 the range of the bison, or buffalo, as they are more commonly named (*Bos Americanus*), extended from well within the British possessions on the north to the Staked Plains of Texas on the south. They were found as far east as Kansas, and westward to the Pacific slope, and their numbers were estimated at from six to ten million, an estimate which in the light of subsequent statistics does not appear to have been excessive. The general introduction of breech-loading firearms, and the opening of the Union Pacific Railway across the continent in 1869, began the most wantonly wasteful slaughter of valuable wild animals that has ever occurred through human agency. Sportsmen are responsible for but a small portion of this destruction, though they too should bear their share of the blame, since many of them killed merely for the sake of killing. The real exterminators of the bison were the fur-traders, who saw their opportunity of marketing countless hides at small initial outlay. They organized hunts on a large scale. The best hunters on the plains were engaged to kill as many and as rapidly as possible, and with the aid of repeating-rifles the slaughter was carried on during all the months when the hide was in a marketable condition. The hunters were systematically followed up by a corps of men with the necessary tools and wagons, who, with the aid of mules, literally pulled off the skin, which was at once salted and packed for transportation. In this way the skinners and packers could keep up with the hunters, who, mounted on fleet horses, hung upon the flanks of the great herds and kept up a ceaseless fusillade with the best of modern firearms.

The Union Pacific Railway divided the great continental herd of bison into sections, which were thereafter known respectively as the northern and southern herds. The former ranged over Montana, the town of Glendive marking about the center of the range, and the latter sought the Staked Plains of Texas. The completion of the Atchison, Topeka, and Santa Fé, and of the Kansas and Northern Pacific railroads opened the whole buffalo country, and enabled their enemies to attack the prey in flank and rear.

In 1872-'73 the Atchison, Topeka, and Santa Fé road transported 459,468 buffalo-hides, and the Kansas Pacific and Northern Pacific railroads probably transported each as many more—exact figures are lacking—making a total of more than a million and a quarter hides. Mr. T. W. Hornaday, of the Smithsonian Institution, says, that during these early years of the war of extermination, the hunters and packers were so careless that not more than one hide in three was delivered to the railroads. In other words, the total of buffaloes slaughtered numbered 4,000,000. From 1874 onward the hunters took more care with skins, since they were getting scarce, so that every 100 marketed represented only 125 dead buffaloes. Taking the lowest estimate for three years, 1872-'74, based on the hides actually shipped, it is found that the total number of buffaloes killed by the hide-hunters was 8,158,780. To this number must be added those buffaloes killed by the Indians during the same period. This number was about 1,215,000, making, when added to the white hunter's record, a grand total of 4,373,780 buffaloes killed in the Southwest in three years. The remnant of the southern herd fled to that great barren waste known as the Staked Plains, and thither a few hide-hunters followed them, until as late as 1880, when their numbers had decreased so that hunting them for profit ceased entirely.

In 1876 the northern herd greatly exceeded the southern herd alike in numbers and in the extent of its range. The traders of Miles City, Montana, estimated that there were at that time more than 500,000 buffaloes within 150 miles of that place, and that all told the northern herd numbered something like a million head. The Northern Pacific Railroad was opened for traffic eastward from Glendive in 1881. "I am told by the hide-buyers," says Mr. Hornaday, "that in that year it carried 160,000 buffalo-hides out of the country, and an equal number the year following. The number shipped by steamers on the Missouri river is at present unknown. In 1883 the number of hides shipped fell to 25,000 and the catch of the next season amounted to but one car-load of hides, which were shipped from Dickenson, Dakota. In 1885 not a single hide was in the market, and the buyers announced that the end had come."

"The northern herd, then, survived the extinction of the southern herd by about ten

years, and its extermination is to-day so nearly complete as to be regarded as an accomplished fact. To-day what remains of the millions of twenty years ago? Two or three little bands of trembling, terror-stricken fugitives, vainly endeavoring to find shelter from blood-thirsty man in the wildest and most desolate country, pursued hither and thither, and shot at by every cow-boy whose glance falls upon them, and to be pursued with increasing vigor and recklessness until the last one falls. As the result of a careful investigation, I am convinced that there are now not more than 200 wild buffaloes alive in the United States territory, outside of Yellowstone Park. Of this number there are, as has been said, about 100 or fewer in the Panhandle of Texas, about 80 more in the country where our collecting was done (near Little Dry, Montana), and perhaps 75 more in the neighborhood of Bear's Paw mountain, Montana. Strange as it may seem, there are still half a dozen head in Southwestern Dakota, and I am told there are a few straggling bison in Clark's Fork region near the National Park. In the latter reservation there are between 100 and 125 head, and they are increasing at the rate of ten per cent. annually."

This statement is no doubt more recent than the report of the Park superintendent cited elsewhere, and it is to be hoped, though not as yet confidently affirmed, that it is the more correct of the two.

In 1886 the Smithsonian Institution awoke to the fact that the bison was nearly extinct, and the National Museum still without specimens. Mr. T. W. Hornaday, one of the most accomplished naturalists and taxidermists of the staff, was directed to organize an expedition which visited the Bad Lands of Montana, near Little Dry, 75 miles north of Miles City, Montana.

While the expedition was on its way toward the hunting-grounds, its members saw thousands of bleaching skeletons scattered over the prairie in every direction. After passing the Red Buttes they were hardly ever out of sight of these white memorials of man's short-sighted rapacity, and at times twenty or more were in sight at once. In one place seventeen skeletons were counted grouped together in a space of not more than two acres. The skeletons were often in a remarkable state of preservation, and eight absolutely perfect ones were secured, bleached to a snowy whiteness. The hunters remained in the Bad Lands till the blizzards of December warned them to retreat, and reached Washington early in 1887 with the fruits of what must be regarded as the last buffalo-hunt. They killed altogether twenty-five animals, but the hide of one of the finest was stolen by hostile Indians. A fine group has been set up in the National Museum at Washington under Mr. Hornaday's superintendence, representing six bison, from a calf of three months old to a magnificent bull nearly six feet high. When

it is remembered that these animals would no doubt have been wantonly shot, and perhaps left for the wolves to devour, their sacrifice to the interests of science is excusable. On its way back the expedition secured fifty-one perfect skulls from among the thousands upon the prairie, for now that the living buffalo is gone, even his bones have acquired a commercial value, and the more accessible portions of the "buffalo range" are stripped of everything that is worth carrying away.

It has been said that an effort is being made to preserve and protect the bison in the Yellowstone National Park. A troop of United States cavalry is permanently quartered there charged with protecting it; but fifty or sixty men, even with the best intentions, must needs find their hands full to guard 8,500 square miles of forest and mountain yearly invaded by tourists, and perpetually subject to the inroads of scarcely less predatory Indians and white marauders.

In his report for 1887, Mr. P. H. Conger, the Park superintendent, says: "A small number of buffaloes still remain in the Park; but after as careful and thorough an investigation as is practicable, I am unable to state their numbers with any approach to accuracy. My impression is that they have heretofore been somewhat overestimated, and that at the present time they will not exceed one hundred in number. They are divided into three separate herds. One of these ranges between Hellroaring and Slough creeks; in summer well up on these streams in the mountains outside the Park limits, and in the winter, lower down on small tributaries of the Yellowstone, within the Park. If the reports made several years ago can be relied on, this herd has rapidly diminished, and it is doubtful if it now exceeds some twenty or thirty in number. Whether or not this decrease has been due to illegal killing by hunters, or to other causes, I am unable to say, though I do not believe that many have been killed within the past two years. Another herd ranges on Specimen mountain, and the waters of Pelican creek. The herd was seen by reliable parties several times last winter, and was variously estimated at from forty to eighty. A traveler on the Cook City road claimed to have counted fifty-four near the base of Specimen ridge. A scouting party which I sent out during the month of May found but twenty-seven head of this herd, with four young calves. It is possible that the herd at this time was broken up, and that but one portion of it was found. The third herd ranges along the Continental divide, and is much scattered. A band of nine or ten from this herd was seen several times this spring in the vicinity of the Upper Geyser Basin. It will take close observation for several years to determine with any certainty the number of these animals, or whether or not they are diminishing in numbers. It is practically certain that none have been killed within the Park limits within the last two years, and yet there is an

equal certainty that the present numbers do not approach those of past estimates."

The Yellowstone Park buffaloes differ from those that formerly abounded on the Great Plains, and even from those known as the mountain buffalo, that ranged in the Colorado parks. It is probable that they are a cross between the two. They are described as somewhat smaller, of lighter color, less curly, and with horns smaller and less spreading. They have smaller shoulder-humps, and larger, darker brisket-wattles. It is said that they are more hardy, fleet, and intelligent than the larger variety of the plains, and their hides are more valuable, being covered with a softer quality of hair.

Besides these wild preserves there are scattered through the country several small private herds which confirm the universal testimony as to the possibility of domestication. In the British possessions an attempt in the same direction is making on a larger scale. In 1879, Mr. S. L. Bedson, warden of the Manitoba penitentiary, at Stony mountain, in that province, foreseeing the approaching extermination of the wild bison, secured a bull and four calves with a view to breeding pure stock as well as crossing with domestic cattle. The increase was so surprisingly rapid, that in a few years he had a considerable herd, and was a prime mover in the organization of "The Northwest Buffalo Breeding Company," having for its object the cultivation of buffalo grade-cattle. Mr. Bedson writes that there is seldom much difficulty in crossing the buffalo with the domestic cow. It has no particular breeding-season, calves being dropped at all times of the year, and with apparent impunity, even in the rigorous climate of Manitoba. Owing to the hereditary traits of the animal it needs but little care, requiring no housing, even in winter; and they forage a great deal of their own food at all times. At the date of writing the herd numbered eighty-two head, all told, of which fifty-two, namely twenty bulls and thirty-two cows—are pure-bred Manitoban buffalo. It is estimated, judging from Mr. Bedson's actual experience, that in five years, with average good fortune, the company will control a herd of near three hundred head.

The flesh of the buffalo is nearly equal to beef in its nutritious and savory qualities. The fresh hide is now worth \$35, and there is every probability that a few years of training will make the wild ox of North America a tractable servant of man.

BULGARIA, a principality in Eastern Europe, created into an autonomous province, tributary to and under the suzerainty of the Sultan of Turkey, by the Treaty of Berlin. The legislative powers were committed to a single assembly, called the *Sobranje*, the members of which are elected directly by universal suffrage, in the proportion of one to every ten thousand of the population.

Eastern Roumelia by the same instrument

was made an autonomous province of Turkey, remaining under the direct political and military authority of the Sultan. In the revolution of Sept. 17, 1885, the Governor-General was deposed, and the union of the province within Bulgaria proclaimed. Prince Alexander of Bulgaria immediately placed himself at the head of the revolution, and soon afterward issued a ukase for the assimilation of the civil, military, and judicial systems of the two provinces. A conference of the treaty powers was held in Constantinople toward the close of 1885, and in accordance with their suggestions, the Sultan, on Jan. 31, 1886, appointed Prince Alexander Governor-General of Eastern Roumelia, and issued a firman on April 6, 1886, recognizing a personal union of the provinces under the Prince of Bulgaria. The Mussulman districts of Kirjali and the Roupchous, or Rhodope, were to be ceded to the Porte. The same firman provided for the revision of the organic statute by a Turco-Bulgarian commission, which met in Sofia, but did not conclude its labors, owing to the Bulgarian revolution of Aug. 20, 1886. The administrative union of the provinces had already been accomplished. The customs line of Bulgaria was extended to the Turkish frontier. A legislative union was also established by the admission of Roumelian delegates to the *Sobranje*.

Alexander I, who was elected Prince of Bulgaria by the Constituent Assembly on April 29, 1879, was seized by revolutionists on the night of Aug. 20, 1886, and conveyed across the frontier. He subsequently returned, and formally abdicated on Sept. 7, 1886, having first selected a regency to administer the government pending the election of his successor. The regents, who, in accordance with an amendment of the Constitution made in 1883, were three in number, were Karaveloff, Stambuloff, and Mutkuroff.

Area and Population.—The area of Bulgaria is 24,860 square miles, and its population in 1881 was 2,007,919. Eastern Roumelia has an area of 13,500 square miles, and had in 1885, according to a census taken Jan. 18, over 975,050 inhabitants, of whom 681,784 were Christian Bulgarians, 200,495 Moslem Bulgarians and Turks, 58,028 Greeks, 27,190 Gypsies, 6,982 Jews, 1,865 Armenians, and 3,733 foreigners. Sofia, the capital of the united provinces, had in 1881 a population of 20,501 souls. Philippopolis, the capital of Eastern Roumelia, has 38,442. The Mussulman population of Eastern Roumelia was reduced by the recession of the canton of Kirjali and twenty villages of the Rhodope to 160,000.

Commerce.—The value of imports into Bulgaria in 1884 was 46,851,280 lei, or francs; of exports, 48,867,235 lei. The leading articles of export are wheat and wool. The chief products of Eastern Roumelia are grain, wine, tobacco, wool, hides, timber, a coarse woollen cloth, and woollen braid, which are exported to Turkish countries, and timber, which is ex-

ported to Asia Minor. The total value of the imports in 1888 was 54,749,868 piasters, and of the exports, 64,099,964 piasters.

Railroads.—Bulgaria has a line of railroad running from Rustchuk to Varna, a distance of 140 miles. A line, 74 miles in length, is in process of construction from Vakarel to Tsaribrod, to connect with the Turkish system.

Finance.—The Bulgarian budget for 1886 estimated the receipts at 48,000,000 lei, and the expenditure at 85,780,324 lei. The revenue of Eastern Roumelia was reckoned by the European commission of 1879 at 800,000 Turkish pounds per annum, and the tribute to be paid to the Porte was fixed at three tenths of this sum, or 240,000 Turkish pounds. The actual revenue has not exceeded 600,000 Turkish pounds, and the Provincial Assembly in 1882 voted to reduce the tribute to 180,000 Turkish pounds. Since the overthrow of the Eastern Roumelian Government in 1885 no tribute has been paid. The Treaty of Berlin provided that Bulgaria's share in the public debt of Turkey and the annual tribute that she should pay should be fixed by agreement between the signatory powers, but the amounts have not yet been settled upon. The revenue of Eastern Roumelia in the budget of 1885-'86 was estimated at 672,550 Turkish pounds, and the expenditure at 676,650 pounds.

Diplomatic Negotiations.—The Russian Government, after proposing the Prince of Mingrelia as a candidate for the Bulgarian throne, sent a note to the powers complaining that the regency had summoned the Sobranje, contrary to its advice, and, instead of forming a coalition government, had introduced a more radical element. To this the regents replied early in January, 1887, pointing out that a proposition made to Zankoff to form a coalition ministry had been rejected by the counsel of Gen. Kaulbars. A suggestion was made that Russia should enter Bulgaria as the madatory of the powers, and compel the observance of the Treaty of Berlin, but the Ozar declined to accept a European commission to intervene in the principality. Russia, before proposing another candidate, demanded the retirement of the regents and their supporters in the government, and the election of a new Sobranje for Bulgaria only. Negotiations on these bases were carried on between Russia, Austria, and the Porte, and between the Porte and Bulgaria. In January, Zankoff went to Constantinople, and submitted to the Grand Vizier the demands of his party, which included the portfolio of Foreign Affairs and the Interior, the appointment of a Russian as Minister of War, the election of the Prince of Mingrelia, a general political amnesty, and the disbandment of the existing army. The regency offered to resign if so advised by all the powers, and all of them except England approved this step. Grekoff and Stoiloff were sent to Constantinople as envoys of the Bulgarian Government, and the Porte discussed with them Zankoff's pro-

gramme, except the propositions for appointing a Russian Minister of War, disbanding the army, and recalling the exiled officers, and the points relating to the immediate resignation of the regency, the summoning of a new Great Sobranje, and the election of the Mingrelian prince to the vacant throne. When the Bulgarian delegates met Zankoff, the latter proposed that the ministerial offices should be divided between the party in power, the adherents of Karaveloff, and the Zankoffists. Finally, after Zankoff had made various impracticable propositions, the Porte, on Feb. 22, accused him of bad faith, and refused to treat with him longer. Dr. Vulkovich, the Bulgarian agent in Constantinople, agreed, on behalf of his Government, that the regency should resign, and a new one be appointed with one Zankoffist member; that a new Cabinet should be constituted, having two Zankoffist members and a Russian Minister of War, but the latter should be responsible to the Assembly, and no Russian officers should enter the Bulgarian army, except in the capacity of instructors; and, finally, that the Sobranje should be dissolved immediately, but on condition that a Great Sobranje should be convoked for the election of a prince within thirty days, and that some other candidate should be presented by the great powers besides the Prince of Mingrelia, and Prince George of Leuchtenberg, who had been more recently suggested for the place by the Russian Government.

Revolutionary Conspiracies.—While the diplomatic discussion was proceeding, a plot was laid for carrying out the Russian plan, as proposed by Zankoff, by means of a military revolution. Col. Nicolaieff, the Minister of War, and Major Popoff, commander of the 1st infantry regiment, received through a merchant named Papasoglou and his wife, offers of large bribes if they would join in the conspiracy. The woman went to Sofia to make the arrangements with Nicolaieff, who pretended to enter into the plot. She was arrested in the latter part of January, and in the judicial examination charged M. de Nelidoff, the Russian ambassador at Constantinople, with being the prime mover in the conspiracy.

After the final rejection of Zankoff's terms, a serious military outbreak occurred at Silistria and Rustchuk. The mutiny was planned from Roumania by Grueff, Bendereff, Dimitrieff, Dikoff, Kavaloff, and other cashiered and exiled officers of the Bulgarian army. The opposition leaders, Karaveloff, Zankoff, and Zankoff, were privy to the plot. At Silistria the revolt was headed by Col. Kristeff, the commander of the garrison.

The Government had taken precautions against a general insurrection of the Zankoffists, which had been planned for the 8d of March, the anniversary of the signing of the Treaty of San Stefano. The rising in Silistria was begun prematurely by Kristeff, on learning that messages from Bendereff had fallen

into the hands of the Government. He summoned the troops on Feb. 26, announced that the regents had resigned, and proposed that Zankoff should be proclaimed regent. A part of the garrison marched away, and prepared under Capt. Krivandoff to resist the revolution, while the others followed their commander. In the evening an engagement was fought, in which the disloyal troops were successful. On the following afternoon, after the militia and others of the population had joined the troops who were faithful to the regency, he sallied from the fortress, but was driven back. He then cannonaded the town in order to awe the people, but only exasperated them. On Feb. 29, he marched his force into the town, and while he was away Krivandoff overpowered the guards that were left at the fortress, and took possession of it. Kristeff made an attempt to rouse the population against the Government, and, failing in that, left the town to escape the troops who were rapidly approaching from Rustchuk, Varna, and other places. After vainly seeking to gain adherents among the country population, the leader of the revolt returned, bearing a flag of truce, but was shot while riding through the streets. Several hundred persons were killed during the disturbances. The mutinous soldiers who were not killed fled into Roumania, and were arrested by the authorities of that country and sent to Bucharest.

During the absence of a great part of the Rustchuk garrison, a revolt was raised in that town. The officers who were implicated were in correspondence with Nabokoff, a Russian subject, who was the author of the revolt at Bourgas, and had since lived as a refugee in Constantinople. Two officers named Cardjeff and Panoff, rode through the city proclaiming the Metropolitan Clement as regent. The battalion of engineers stationed there in the night of March 2 attacked the troops of the line who took refuge in the barracks, and were about to surrender, when the militia and townspeople surrounded the mutinous troops. An engagement ensued which lasted from early morning till near evening, when the rebels fled and attempted to cross the Danube in boats, but were compelled by a heavy fire to leave their boats and take refuge on an island, where they were captured. Major Onzounoff and Col. Filoff, the leaders of the insurgents, were severely wounded. The participants were punished with exemplary severity. Numbers escaped into Roumania, where they were sent to Sugo-vista.

After the suppression of the uprising, Karaveloff, Nikisoroff, Zanoft, and twenty-two other prominent persons were placed under arrest. A court-martial condemned to death sixteen officers and civilians for having been the leaders in the revolt at Rustchuk. Of these nine were shot on March 6, while the sentences of the others were commuted. A captain of engineers named Bolmann, who

was a Russian subject, was handed over to the German consulate. Another court-martial tried the minor conspirators. The private soldiers of the mutinous battalion who were new recruits were pardoned, but 120 of them and 11 non-commissioned officers were sentenced to imprisonment with hard labor. One of the leaders of the insurrection, an editor named Staveneff, had previously supported the regency, and Ouzounoff was formerly a warm adherent of Prince Alexander. Nikisoroff complained that he was maltreated by his jailers, in a letter to the French diplomatic representative. The Bulgarian Government ordered an investigation, and reported that he refused to show any marks of ill-usage. It has, nevertheless, been credibly asserted, that he was severely flogged by a high military officer, and that many politicians of the Zankoff party were subjected to the same treatment. The French *chargé d'affaires* at Constantinople joined M. de Nelidoff in protesting to the Grand Vizier against the military executions and the alleged cruel treatment of Karaveloff and other prisoners at Sofia. In a circular to the powers, Russia proposed an inquiry at Sofia, but most of them, including Turkey, declined to interfere in the internal affairs of Bulgaria. On March 12, Karaveloff, Zanoft, and Nikisoroff were released on bail. Shumla, Trn, Plevna, Varna, and other places, were placed under martial law. The Bulgarian Government complained of the supineness of the Roumanian authorities, in allowing the refugees to plan disturbances across the border. After the insurrection had been suppressed, Grueff, Bendereff, and other conspirators, as well as the fugitive insurgents, were arrested, and were subsequently expelled from Roumania, while no Bulgarian refugees were allowed longer to reside near the frontier. The Bulgarian authorities dismissed many officials, cashiered many officers in the army, while others resigned, and by their rigorous measures produced depression and discontent in the country. The leaders of the Opposition were re-arrested, and on April 8, were again admitted to bail, but were still kept under surveillance. Troops were sent to Widdin, Plevna, Vratza, and Tirnova, to disarm the reserves, who showed an insurrectionary spirit, but while those of Tirnova submitted, the reservists of the other districts resisted the order, and at Vratza, the troops sided with the mutineers. Refugees in Bucharest attempted to murder Mantoff, the prefect of Rustchuk, and Capt. Andreff, who had presided over the court-martial. The Roumanian Government, after those events, ordered all Bulgarians who were not domiciled or engaged in business, to leave the country.

Financial Difficulties.—The Zaribrod-Vakarel line was to be completed by Sept. 15, 1887, and for that and other purposes the Government found it necessary to seek a foreign loan. Until the Bulgarian branch of the Turkish

junction lines should be completed, the Servian line, which was already finished, could not be opened to Salonica, because the Conférence à Quatre had decided that both railroads were to be opened for traffic simultaneously, in order that neither of them should have the commercial advantage of first getting into operation. When the delegates of the Sobranje visited England, in the latter part of 1886, they opened negotiations with a financial group for a loan of 25,000,000 francs, to be issued at 94, bearing interest at 6 per cent. English capitalists would not take the risk of lending to a Government which Russia refused to recognize, and in May, 1887, signified their final refusal. An Austrian bank offered to lend the sum at 6 per cent. with issue at 90, but this was considered usurious by the Bulgarians, who could have borrowed at 5 per cent. with issue at par before the deposition of Prince Alexander.

Mission of Riza Bey.—The mediatory negotiations of the Porte were transferred to Sofia in order that they might be governed by a better knowledge of the conditions in Bulgaria. Riza Bey, the Turkish commissioner, arrived just before the suppression of the insurrection. He advised the Bulgarian Government to refrain from retaliatory measures in order to preserve the good-will of the powers and avoid further bloodshed. He gave offense to the Government by proposing that an international commission should investigate the charges of cruelty to prisoners. The ministry refused to discuss longer the admission of Zankoffists into the regency and the Cabinet. M. de Neli-doff, in a confidential communication to the Porte, proposed that a Turkish army corps should occupy Eastern Roumelia, but the Turkish Government refused to proceed to such a measure. A proposition to appoint a regent and send a Russian and a Turkish commissioner to Bulgaria was likewise not entertained. Riza Bey's report was favorable to the regency. The Porte on May 21 sent a circular to the powers urging them to nominate one or two candidates for the post of prince, in order to put an end to the crisis. Informal proposals were made by Russia for a simultaneous intervention of the Turks in Eastern Roumelia and of the Russians in Bulgaria, but these overtures were repelled by the Turkish Government. When all efforts failed to induce Russia to abandon her obstructive attitude, or to bring about concerted action of the other powers in opposition to Russia, the Bulgarians were impelled to solve their difficulties by independent action. When the question of the election of a prince arose there were unequivocal manifestations all over the country in favor of the re-election of the Battenberg prince. There was much popular dissatisfaction with the Government, not alone on the part of the Opposition, the members of which had been arrested and grossly mishandled by the police officials during the recent crisis, but even in the Patriotic party. There

was jealousy between Radoslavoff, the Prime Minister and nominal leader of the party in power, and Stambuloff, who, with the support of his colleagues, Mutkuroff and Zukoff, the successor to Karaveloff, actually governed the country. Radoslavoff and Colonel Nicolaieff, the War Minister, were strong partisans of Prince Alexander. The regents toward the end of May decided, with the concurrence of a part of the ministry, on proposing Prince Ferdinand of Saxe-Coburg-Gotha for the throne, but the military party threatened to proclaim Alexander as sovereign, and were only restrained by that prince himself who conjured his friends not to persist in a policy that would bring ruin to Bulgaria. He did not, however, at once renounce his candidature, but proposed that Aleko Pasha or Goltz Pasha should be chosen regent, and thus keep the place open for him. The feeling in favor of his restoration grew stronger, and the army was only appeased by assurances that it was in the end inevitable. Quarrels between the members of the Government and the feverish political condition of the country at last constrained the regency to summon the Great Sobranje.

The Election of a Prince.—The Great Assembly was convoked for July 8. The members of the Government had been in communication with various possible candidates for the throne. The Bulgarian delegates to the courts of Europe had eight months before asked Prince Alexander of Coburg if he would accept, and he then made it conditional on the approval of Russia and Germany. Prince Oscar, of Sweden, was tendered the place in like manner, but by the command of his father declined. Prince Waldemar, of Denmark, was still spoken of, and Aleko Pasha was a candidate. Stambuloff was opposed to the recall of Alexander, and when compelled to yield to the popular sentiment was ready to acquiesce in a formal vote in favor of the late prince, but expected him to decline. Radoslavoff and the Radicals desired that Alexander should be elected, and that a new provisional government, with a single regent, should be formed until the favorable moment arrived for him to return. They had, for the event of his refusal, another candidate in the person of Prince Bernard, of Saxe-Weimar, while the regents had settled on the Coburg Prince. Besides Prince Bernard, Prince Frederick of Hohenzollern and Prince Ferdinand of Schleswig-Holstein-Sonderberg-Glücksberg were mentioned as nominees of Prince Alexander, whose election would not preclude his ultimate return. Stambuloff wrote a firm letter to Alexander, in which he submitted that it was necessary for the country to know what hopes could be built on the prince, who replied that his weak state of health would not permit his immediate acceptance, and that so long as he was opposed by the two most powerful men in Europe, meaning the Czar and Prince Bismarck, his restoration would bring disaster and loss of independence to Bul-

garia. The Sobranje convened at Tirnova, the ancient capital, on July 4. The strength of the two factions in the Government was measured by the vote for president, Dr. Tontcheff, a candidate suddenly proposed by Stambuloff, receiving 275 votes, against 74 for the regular nominee of the ministry, and a like number for the candidate of the Opposition. On July 7, Prince Ferdinand of Saxe-Coburg-Gotha was elected Prince of Bulgaria by acclamation. After receiving Ferdinand's conditional acceptance, and choosing a deputation to make the formal tender to the prince-elect, the Sobranje adjourned on July 9.

Change of Ministers.—After the election of a Prince, the quarrel between members of the Cabinet and Stambuloff was brought to an issue by the latter's insisting that Nicolaieff, who objected to the regent's giving direct orders to the army, should resign. The whole Cabinet resigned, and a new one of moderate liberal character was constituted as follows: Stoiloff, President of the Council, Minister of Justice, and Minister of Finance *ad interim*; Nachevich, Minister of Foreign Affairs; Dr. Tchomakoff, Minister of Public Instruction; Dr. Stransky, Minister of the Interior; Major Petroff, Minister of War. The new Government at once directed that all persons under arrest for political reasons should be released. Dr. Stransky, the leader of the Eastern Roumelian revolution, was, when called into the Cabinet, diplomatic agent at Belgrade. Major Petroff was chief of staff during the Servo-Bulgarian war. Stoiloff and Nachevich were the conservative members of the late Cabinet.

Installation of the Prince.—Prince Ferdinand telegraphed his acceptance of the invitation of the Great Assembly, subject to the approval of the Porte and the great powers. To the deputation of the Sobranje which waited on him at Ebenthal, in Austria, on July 15, he said that he should hasten to Bulgaria if he followed the impulses of his heart, but that treaties must be respected, and he hoped by showing his respect for them to justify the confidence of the Porte, regain the good-will of Russia, to whom Bulgaria owed her emancipation, and secure the approval of the other great powers. He announced his conditional acceptance to the representatives of the powers in Vienna. The Porte sent a circular to the powers asking an expression of their views in regard to Prince Ferdinand's election, and all gave a qualified consent except Russia, which replied that, as the Assembly which elected him was an illegal one the St. Petersburg Cabinet could pay no attention to its acts. The Bulgarian deputies urged Prince Ferdinand to come at once to Tirnova and take the oath of office. He intended first to visit St. Petersburg, and enter Bulgaria if possible with the approval of the Czar, but the Russian Government informed him that his election could not be recognized on any pretext. After waiting till the patience of the Bulgarians was al-

most worn out, and finding the European Governments apathetic, he decided to go to Bulgaria without their consent, but not, perhaps, without secret intimations from controlling quarters. When he started, the St. Petersburg Government addressed a circular to the powers expressing the hope that they would not tolerate this infraction of the Berlin Treaty, and declaring that Russia could not constitute herself the sole guardian of its stipulations, now threatened with final subversion. On arriving at Widdin, August 11, the prince issued a proclamation promising to consecrate his life to the happiness of his dear people. He took the constitutional oath at Tirnova before the Sobranje, assembled in special session, on August 14. The proclamation with which he assumed the Government made no allusion to Russia, or to the suzerain power, or to international treaties, and ended with the words, "Long live Bulgaria, free and independent!" The ministry resigned their portfolios into his hands, and the Sobranje was prorogued. On arriving at Widdin, Prince Ferdinand sent a telegram to the Sultan presenting his homage. The St. Petersburg Cabinet, in a dispatch to the Porte, formally protested against Prince Ferdinand's action, and Riza Bey was recalled from Sofia, yet diplomatic relations were not broken off, Artin Effendi receiving the nominal appointment of high commissioner to Bulgaria. In answer to a circular of the Porte, England and the other powers in an identical note expressed their sense of the illegality and impropriety of Prince Ferdinand's proceedings. Russia proposed to denounce the Berlin Treaty, and sounded the Turkish Government on the question of the occupation of Bulgaria by Russian and Eastern Roumelia by Ottoman troops. The Turkish occupation of the Balkans, accompanied with a peremptory demand that Prince Ferdinand should quit the country was then discussed; also the sending of a Russian commissioner to Sofia, Gen. Ernroth being mentioned for the place, accompanied by Artin Effendi, who should act in the same capacity for Turkey. The latter plan was supported by France and Germany, but the Porte, following the counsels of the other powers, declined to take part in such a proceeding. When Prince Ferdinand arrived in Sofia, on August 22, none of the foreign diplomatic agents participated in his reception. Dr. Vulkevich, the Bulgarian political agent at Constantinople, attempted to explain away the declaration of Bulgarian independence contained in the Prince's manifesto. The Turkish Government in a dispatch to Prince Ferdinand informed him that the Porte and the powers considered his conduct illegal. Prince Ferdinand asked permission to go to Constantinople to do homage to the Sultan, but it was refused.

The New Cabinet.—There was much difficulty in the formation of a ministry, but on August 31 one was constituted at last, made up of the following members: Stambuloff, Prime Minis-

ter and Minister of the Interior; Dr. Stransky, Minister of Foreign Affairs; Nachevich, Minister of Finance; Mutkuroff, Minister of War; Zivkoff, Minister of Instruction; Stoiloff, Minister of Justice.

BURMAH, formerly the kingdom of Ava, in Farther India, now a province of the British Empire, administered by a Chief Commissioner under the Viceroy of India. Lower Burmah, hitherto known as British Burmah, comprises the provinces of Arakan, Irrawaddy, Tenasserim, and Pegu, the first three of which were conquered in 1824, and the last named in 1852. Upper Burmah was formerly incorporated in the British Empire by the proclamation of the Viceroy, on Jan. 1, 1886, after the defeat of the King's forces on the Irrawaddy, the capture of the capital, Mandalay, and the deposition of Thebaw, the last King of Ava. The area of Lower Burmah is 87,220 square miles. Its population in 1881 was 3,786,771. Upper Burmah has an area of about 210,000 square miles, and in the neighborhood of 4,000,000 inhabitants.

The Subjugation of Burmah.—Only about 10,000 troops composed the expeditionary force that broke through Thebaw's river-defenses with ease, captured the capital, and led the King into captivity. The cost of the expedition did not exceed \$750,000. For a month after the British were seated in Mandalay the country was tranquil, and the conquest was generally regarded with complacency, because it had rid the country of an incompetent and unpopular monarch. The absence of all central authority soon resulted in an increase of village robberies and dakoity. The disbanded soldiery of the King had no way of living except by plunder. The disturbance and devastation of the invasion had reduced many of the villagers to the same necessity. The Alaungpra princes, who had been released from confinement by the British, gathered small armies, and attempted to set up their rule in parts of the country that were not held by British troops, appointing civil governors and collecting taxes. The English civil commissioners, of whom three were left, each with a small military force, at different points on the Irrawaddy below Mandalay, were successful at first in introducing order in their districts and in securing the submission of the local Woon or governors; yet, as soon as the Alaungpra pretenders appeared in the field, the allegiance of the native officials was given to them, the British were everywhere attacked, and the rule of the district officers was circumscribed within the cantonments of their soldiers, who now vied with the Burmese marauders in ravaging the country. At this point the Ming-woon, or central council, was reinstated in authority at Mandalay, and instantly there was a cessation of disorder, but it soon broke out again when the British still delayed appointing a successor to Thebaw, the members of the Ming-woon themselves secretly embracing the cause of one

or the other of the pretenders. The policy of hesitation had the effect of dividing the allegiance of the Burmans between the different aspirants to the throne, each of whom hoped by gaining a large following and establishing his power over a wide district to induce the conquerors to select him for the succession. The abolition of their sacred monarchy, and the subjection to a foreign yoke, did not enter into the conception of the Burmans. When at last British sovereignty was proclaimed, the rival factions were unable to unite under the standard of any one prince, and the English were able to cope with the universal revolt by attacking the leaders in their separate districts, many of them weakened by intestine wars.

In the valley of the Irrawaddy, below Mandalay, a robber chief named Bo-Swe or Boshway, who had long been a source of annoyance to the British on the river and along the frontier, gathered the strongest body of insurgents. By the end of August, 1886, he held the entire country west of the Irrawaddy, except a small strip on the river. The deputy commissioner of the district, Mr. Phayre, was killed in action. East of the Irrawaddy, bands of robbers infested British as well as Upper Burmah. Naval launches on the Sittang river was attacked, villages were plundered, Englishmen killed, and even in the large trading town of Ningyan robberies were committed and houses burned almost under the eyes of the British soldiers. In the fertile and populous region between Yemethen and Mandalay, the Minzaing or Myen-tsein prince, a brother of Thebaw, unfurled his banner. Not only did the people in this district, which has been called the garden of Burmah, accept the rule of the youthful pretender, and pay him tribute, but insurgent leaders in other parts of the country fought in his name, and he even counted among his adherents members of the central council and the governors of many districts. The chief, Boh-cho, who received from the pretender the title of governor of Pugan, contested with the English deputy-commissioner the control of that district, which had at first been most submissive to the conquerors. He collected revenue from many villages, and burned those that were friendly to the English. A chief named Tok-kyan, with a following of 2,000 men, carried his raids into the same district, in which also a marauder named Nga-kway, with a band of 1,500, also levied contributions, and another leader named Aung-din practiced dakoity. In the south of the district an area of 1,000 square miles was held by Waya-byin, a partisan leader, while on its borders hovered the Kanhle prince with 2,500 fighting men. North of Mandalay, in the country between the Chindwin and the Irrawaddy, the brigand Hla-oo held undisputed sway, except in some of the towns, like Mingin, where the captive employes of the Burmah and Bombay Trading Corporation were delivered up to the British by the Woon. In the same region a number of Along-

pra princes who fled from Mandalay raised bands of adherents. The Bhamo district in the north was one of the least disturbed, though robberies were committed by wild Kachyens from Katran and by dakoits, who, in November, 1886, attacked the town and set fire to some buildings. The Sawbwa of Woontho, a Shan state west of Bhamo, who had been a loyal vassal of Thebaw, refused to recognize the rule of the British, although they offered to leave undisturbed the privileges he had hitherto enjoyed, and promised not to interfere in the internal administration of the state. The Shans farther north, where mines of jade and amber and India-rubber forests are found, manifested a friendly disposition.

On Oct. 1, 1886, the army of occupation consisted of 1,328 British infantry, 15,684 native infantry, 2,278 native cavalry, and 991 artillery. The measures adopted for the pacification of the country were the establishment of troops at various posts, and the formation of movable columns; the organization of a Burmese and Indian police; the establishment of armed steamers on the rivers; amnesty to all who would cease hostility and the general disarmament of the people; division of the country into administrative districts; freedom of trade and of religion; codification of the laws; moderate taxation; and improvement of communication, especially the extension of the railroad from Toungoo to Mandalay. For purposes of government, Upper Burmah was out up into four main divisions, and subdivided into seventeen districts. The Indian code was extended to the conquered country, but with certain important limitations. The deputy-commissioners were given juridical powers, and could sentence criminals to imprisonment, and even to death, subject to an appeal to the commissioners. In most cases those who were caught in acts of hostility were shot as dakoits by their captors, without trial. The fierce Mohammedan troops struck terror into the hearts of the Burmans by their cruelty, not less than by their prowess. The so-called native police was composed of Sikhs and Ghoorkas, who cast off all restraints of discipline, and plundered at will. The fanatical Mohammedans, when they entered the monasteries, were accustomed to destroy the statues of Buddha. The climate was scarcely less trying to the Indian than to the European troops. During the year ending Oct. 31, 1886, 930 men died, not reckoning 91 who were killed, and 2,082 were taken sick.

When Sir Frederick Roberts, commander-in-chief of the Indian army, assumed command of the forces in Burmah in October, 1886, after the death of Sir Herbert MacPherson, the army of occupation was greatly strengthened for a vigorous winter campaign against the insurgents. When cold weather came there were more than 30,000 troops in the field. This force was increased by Sikh military police, who were to take the place of the soldiers

after the formidable bodies of rebels were overthrown. But, since the Sikhs were themselves unruly, and their behavior provocative of discontent, Sir Frederick Roberts pronounced in favor of organizing a Burmese police, and conceived the idea that the militant part of the population, from which were recruited the bands of the rebel leaders and the gangs of dakoits, would afford excellent material for a constabulary.

A successful campaign was prosecuted in 1886 against the most important of the Alaungpra pretenders, the Minzaing prince. His bands were successively routed, and he was driven from every post, until he had to take refuge with the Sawbwa of a small Shan state. Here he died in August, 1886, and his adherents, after quarrelling over the division of his property, and killing the Sawbwa who had given them an asylum, dispersed, and were not heard of more as an organized force.

Flying columns scoured the valley of the Irrawaddy, and the outposts were advanced into the interior after the rains had dried off the plains and cool weather set in. The regular troops were invariably successful in their encounters with the large bands of rebels, and when the latter attempted to make a stand in their stockades, they were driven out with ease and killed by hundreds. The smaller bands were not easily caught, and were often able to inflict losses on the columns of infantry, which could not protect their flanks while moving through the jungle, and were too much encumbered to be able to pursue their assailants. The most effective service was performed by the cavalry, which moved with impunity in the bush and through ravines, where the Burmese could have inflicted serious damage, but were restrained by their common dread of mounted troops, especially lancers.

A large detachment of the re-enforcements from India were sent against Boshway, while river-pirates were suppressed by the naval brigade in steam-launches. Columns of troops soon swept the low country west of the Irrawaddy of Boshway's bands, driving them and their leader back into the Arakan hills. In the Pagan district the agricultural and trading classes had, to a large extent, returned to their peaceful occupations before the beginning of the cold season. The English district officer was unable, however, to defend those who accepted British rule from the vengeance of the rebels, who murdered native officials, and sacked and burned friendly villages. Once Bo-cho surrounded the deputy commissioner and his guard with 900 men, and fired at them all day, without, however, inflicting any damage. When the troops took the field the district was soon cleared of hostile bands. Before the end of cold weather Bo-cho was a fugitive with only 30 followers. He raised a new band by uttering a prediction that the 16th of April, which is the end of the Burmese year, would terminate the British dominion, but could mus-

ter only about 100 men, who were soon dispersed. Tok-kyan's large force was also crushed, and himself driven to flight with only 60 followers left. Nga-kway lost 200 of his 1,500 men in battle, 60 being slain in one fight, and after his band was broken up, offered to accept the promised amnesty. The Kanhle prince lost 200 men in a single combat, and was finally driven from his teak-stockade, and after collecting a fresh force, was again defeated, and compelled to flee from the district. The villagers in some cases beat off marauding bands without assistance from the troops, and sometimes dakoits were captured and sent in by the head men of the villages. Many of the robbers after surrendering were enlisted in the new Burmese police force, and their leaders were made officers. Waya-byin surrendered and delivered up his arms, and was restored to his former official position. Dakoits had formerly impoverished whole villages by driving off all the cattle and selling them for their hides and meat, and sometimes for their hides alone. Large numbers of draft-oxen were also taken for military purposes. The distress that was caused by robbery and the devastation of guerrilla warfare was, to some extent, relieved by giving the people labor at good wages on new roads, and on the Toungoo Railroad. The robbery of cattle was rendered unprofitable by preventing the exportation of hides.

In the north columns were placed in the field against Hla-oo as soon as the troops arrived from India. After numerous encounters, his forces were completely broken, and at length he offered to surrender on condition that he should not be banished, but the British would not agree to his remaining in the district. On April 15, when his band was reduced to 40 men, who were suffering for want of food, this insurgent chief was murdered in his hiding-place in the jungle, near Moneganea, in the Sagain district, by one of his own followers. In January an expedition was sent into the northern Shan country. The Sawbwa of Woontho had been accorded a year of grace in which to make his submission. When the troops appeared he fled northward, and his town was occupied by Gen. Cox. Other Sawbwass of the neighborhood submitted, and were confirmed in their offices by the British. The Woontho-Sawbwa afterward returned with a considerable force, and threatened the British. Re-enforcements were sent, and about the 1st of March, while the British were preparing an attack in force, he agreed to their terms, delivered up a quantity of arms, and after undertaking to pay a tribute of 80,000 rupees, received from them investiture as Sawbwa. A garrison was left in Woontho until the revenue should be paid in full, and other posts were held in Katha, on the north. The full amount of the tribute was paid by the Bombay and Burmah Trading Company for the Sawbwa, but his submission was only nominal, and he subsequently refused to meet the Commission-

er of Mandalay, and fired on British troops. The Sawbwa of Gouksouk, with the assistance of a number of chiefs who had been supporters of the Limbin prince, carried out an attack on a British column that was sent into the eastern Shan states in January, but was defeated. The Shan confederacy began to break up in March, and many of the followers of the Limbin prince deserted him. In May this prince, who was the last of the Alaungpra pretenders in the field, gave himself up, and was taken as a prisoner of state to Rangoon. Sekyamise, another prince of the royal family, raised his standard in the summer, but was joined only by inconsiderable bands, which were continually hunted and harassed by the mounted infantry and police. Still another Alaungpra prince plotted an insurrection in Mandalay, but was captured in a house in that city with 60 other conspirators.

Sir Frederick Roberts returned to India in February, being succeeded as commander-in-chief in Burmah by Gen. Arbuthnot. The most important service of Gen. Roberts for the pacification of Upper Burmah was securing the co-operation of the Buddhist priesthood by recognizing the ecclesiastical authority of the regular head of the hierarchy, whereas formerly in British Burmah preference was shown to a schismatic sect. Before leaving, the general made a tour in Lower Burmah with the Buddhist archbishop. A proclamation had been issued at Mandalay, signed by the archbishop, who counseled submission and obedience to British rule, and by the commander-in-chief, who offered a full pardon to all who should deliver up their arms before February 16, and promised work to those who submitted. Sir Charles Bernard, the civil commissioner, was recalled about this time, being succeeded by C. H. T. Crosthwaite, formerly commissioner at Rangoon. The separation of the two provinces had already ceased, Upper and Lower Burmah being placed under the same civil administration. The strength of the military garrison in Upper Burmah for the ensuing season was fixed at 16,000 men, with about the same number of the new police. The police force already organized consisted only of 5,000 Sikhs and others from Northern India and 3,500 Burmese, but until it could be brought up to the required strength enough soldiers were retained to supply the deficiency. When the military force was reduced to its summer strength Gen. Arbuthnot turned over the command to Maj.-Gen. White. In May it was decided to increase the military police to 23,000 men, of whom 6,000 should be Burmans. About 11,000 men had already been raised in the Punjab. Some severe encounters took place in May and June between the troops and the Burmans in the district where Boshway was still at liberty. There were also fresh disturbances on the other side of the river along the frontier of British Burmah, but the civil officer was here able to cope with the insurgents, and removed the cause of trouble by

giving the people work on the roads. There was a scarcity of rice, which rose to a very high price, but supplies were brought from Lower Burmah, and the large sums paid out in wages on the public works prevented a famine, except in some districts. The Shans, who refused to work, suffered great distress.

The Civil Administration.—Mr. Crosthwaite remedied certain evils that had existed under the administration of his predecessor. The Chinese had grievances which brought them into disputes with the authorities and threatened to increase the frontier difficulties. In January the deputy commissioner at Bhamo went so far as to impose fines on the Chinese community and imprison their head man. The new chief commissioner met a deputation of Chinamen at Mandalay on March 24, and agreed that the duty on jade should be paid at Mogoung, and that Chinese leases of the India-rubber forests should be recognized. The barbarous practice of decapitating dakoits and exhibiting their heads, which had been permitted as a means of inspiring terror, was discontinued by his orders, after the subject had been brought up in the British Parliament. In the beginning of March the Kobo valley, on the frontier of the Indian province of Manipoor, was annexed to the British possessions.

The Government revised the leases held by the Bombay and Burmah Corporation, for a supposed infraction of whose contract rights the war against Thebaw was begun. The leases were recognized, but instead of paying the yearly rental specified in the contract, the company will be required to pay a fixed price for every log of teak extracted.

In the spring and summer the claims against the late Burmese Government were considered. They amounted altogether to 64½ lakhs. The bulk of them were for articles furnished by merchants, mostly Frenchmen, to Thebaw. These were excluded under a decision that the Indian Government would not be responsible for the personal debts of the King, but only for the liabilities of his Government. This distinction, which was an entirely arbitrary one, and had never been recognized in Burmese jurisprudence, seemed particularly unjust, because the Indian Government had confiscated the contents of the King's palace and had sold for its own benefit many of the very articles for which payment was now refused.

The Ruby-Mines.—Northeast of Mandalay, at some distance back from the Irrawaddy river, is a ruby-producing tract, the only one known to exist. The mines were the property of the kings of Ava, who derived a considerable revenue from letting the right to dig for rubies. The last lease made by Thebaw expired in July, 1886. At the close of that year a military expedition was sent from Mandalay to take possession of the mines for the new Government. It set out on December 19, crossed a mountain pass, and descended upon Mogouk, the principal town of the mining district. Merchants

and miners who were working the mines contributed their means to raise a military force to resist the British occupation, and secured the co-operation of the Shan Sawbwas of the region. Strong stockades were erected and formidable preparations were made to meet the invaders, but as soon as the troops approached, the Shans and Burmese hirelings fled to the hills, after first robbing their employers of all their wealth. A garrison was left at the mines, but their possession was not secure because the Sawbwa of Mainlung and other Shan chiefs refused to submit to British authority. A column was sent against Mainlung, and was fired on when approaching the town, which was strongly stockaded. Sir Frederick Roberts visited the mines in January and arranged the disposition of garrisons and selected healthy quarters for troops during the hot season. Mr. Streeter, a junior member of a great London firm of jewelers, accompanied the original expedition to the mines, and was allowed to purchase rubies, thoroughly examine the mines, and make experiments in mining. After his inspection an offer of four lakhs of rupees per annum was made for a five years' lease of the mines. The Indian Government provisionally accepted this tender, but when the facts became known the secret bargain was denounced in Burmah, India, and Europe. Merchants of Bombay, Calcutta, and Rangoon asked permission to examine the mines, but the authorities refused to furnish them with an escort, or to allow them to visit the mines without an escort. A syndicate of Parisian jewelers, who were supposed to represent the banking-house of Rothschild, made an offer of twelve times the price proposed by Messrs. Streeter. Those who were acquainted with the subject asserted that the mines, with the aid of machinery and explosives, would pay a profit on a rent many times greater than the English jewelers offered to pay. Mr. Crosthwaite went to inspect the ruby-mines in April. While he was there the Sawbwas of Momeik and Mainlung offered their submission and agreed to pay tribute. Other Shan chiefs still held aloof. The Government finally decided to retain the monopoly of the mines in its own hands, throwing them open to be worked by the old methods, and exacting the usual duty of 80 per cent. of the value of every stone.

Petroleum Fields.—There are two places in Burmah where earth-oil has been produced in quantities for some years. At Akyab, on the coast of Arakan, in British Burmah, wells have been sunk and are worked by two English companies on the American system. The oil obtained here is light and clear, and has the advantage over American oil of being less explosive, though its illuminating power is less. The production, however, is so costly that the works have yielded no profit. The other oil-field is at Yenangyoung, on the Irrawaddy, in Upper Burmah. Here there are no bores. The oil is obtained by digging holes in the earth,

and allowing it to ooze up and collect. It is a dark, heavy liquid, like the Baku product when the wells there were worked in the same way. There are other parts of Upper Burmah where oil of the same kind is obtained by the same process. Great expectations are enter-

tained regarding the petroleum-fields of Upper Burmah, yet nothing is yet known of the depth of bore necessary to reach a flow of oil, of the strata of rock, of the probable productivity of the wells, or of the quality of the oil when obtained by scientific methods from below.

C

CALIFORNIA. State Government.—The following were the State officers at the beginning of the year: Governor, Washington Bartlett, Democrat; Lieutenant-Governor, R. W. Waterman, Republican; Secretary of State, W. O. Hendricks, Democrat; Treasurer, Adam Herold, Democrat; Comptroller, J. P. Dunn, Democrat; Attorney-General, G. A. Johnson, Democrat; Surveyor-General, Theodore Reichert, Republican; Superintendent of Public Instruction, Ira G. Hoitt, Republican; State Engineer, William H. Hall, Democrat; Railroad Commissioners, A. Abbott, P. J. White, J. W. Rea; Supreme Court: Chief-Justice, Robert F. Morrison; Associate Justices, E. W. McKinstry, J. D. Thornton, J. R. Sharpstein, Jackson Temple, T. B. McFarland, A. Van R. Patterson. The death of Chief-Justice Morrison in March, caused a vacancy on the supreme bench, which was filled by the appointment of Miles Searle. On Sept. 12, Governor Bartlett died, and the State government again came into the hands of the Republicans, by the promotion of Lieutenant-Governor Waterman.

Legislative Session.—The Legislature assembled Jan. 8, and adjourned March 12. One of its earliest acts was the election of George Hearst, Democrat, to be United States Senator for six years, by a vote of 65 against 52 for Henry Vrooman. The measures of prime importance discussed at this session related to the disposition of mining *débris*, and to irrigation. Legislation was had on the latter subject only. As the Supreme Court of the State had decided in favor of the ownership of the riparian proprietor in the streams of the State, the irrigation problem consisted in devising some means of permitting the withdrawal of water without violating that right. It was enacted that "whenever fifty or a majority of freeholders owning lands susceptible of one mode of irrigation, from a common source, and by the same system of works, desire to provide for the irrigation of the same, they may propose the organization of an irrigation district." An election shall then be held, in which the voters of the proposed district decide whether such district shall, in fact, be organized. If the proposal is favored, certain district officers and a board of directors are chosen for a term of two years. The board of directors shall have the right to acquire, either by purchase or by condemnation, according to law, all lands and waters and other property necessary for the construction, use, supply, repair, or improvement of canals, or other works needful for irriga-

tion purposes. It shall have power to manage and conduct the business of the district, make all necessary contracts, take conveyances, maintain suits at law or in equity to carry out its powers, and generally to accomplish the purpose of the act by constructing canals, apportioning the flow of water, and otherwise. It may issue bonds of the district in payment for lands or waters purchased or taken. These bonds shall be paid by an annual assessment on the real property of the district. The use of all water required for irrigation in any such organized district, together with the rights of way for canals and other property required for the purpose of this act is declared to be a public use. Under this act several districts were created during the year, but no test of its constitutionality has yet been made.

Another important measure authorizes the annual levy of a tax of one cent on each \$100 of property, for the exclusive support and improvement of the University of California, the money thus collected to be called the State University fund.

The insurance laws were extensively amended in matters of detail, and numerous changes made in the organization and regulation of the militia. The uniformed militia of the State is named the National Guard of California, and is not to exceed fifty companies.

An act regulating the hours of labor fixes eight hours as a day's work, unless otherwise stipulated by the parties. Twelve hours of labor, shall, however, constitute a day's work for drivers, conductors, and grip-men, on street-cars, and any contract for longer hours shall be void at the option of the employé.

Towns, cities, and municipal corporations, are permitted to issue bonds and incur indebtedness for extensive public improvements only when two thirds of the legislative branch of the town or city and the executive thereof approve and two thirds of the voters at a special election signify their assent.

The laws regulating government of counties and the duties of county officers were also thoroughly revised.

An appropriation of \$5,000 was made for a monument to James W. Marshall, the discoverer of gold in California, to be erected at his grave in Coloma, Eldorado County. Other acts were as follow :

To prevent fraud and imposition in the matter of stamping and labeling produce and manufactured goods. Appropriating \$250,000 for the erection of additional buildings for the chronic insane.

To encourage and provide for the dissemination of a knowledge of the arts, sciences, and general literature, and the founding, maintaining, and perpetuating public libraries, museums, and galleries of art, and the receipt of donations and contributions thereto when established.

To prohibit the sophistication and adulteration of wine, and to prevent fraud in the manufacture and sale thereof.

To authorize certain officials of cities to levy taxes for the maintenance of public parks of over ten acres within their respective limits.

To provide for permanent improvements at the California Home for the care and training of feeble-minded children; also an act to provide for the government and management of said Home.

To grant to the United States certain tide-lands, belonging to the State of California, for the purpose of improving the harbor of Humboldt Bay.

To provide for the completion of all unfinished county, city, and county, town, and township buildings in the several counties, cities, and counties, cities, and towns throughout the State.

To enlarge the county of San Benito, by including therein portions of the counties of Fresno and Merced; to redefine the boundaries of Del Norte and Siskiyou counties.

To protect life and property against the careless and malicious use or handling of dynamite and other explosives.

To authorize executors and administrators to make mortgages and leases of the real estate of decedents in certain ways.

For the better protection of settlers on the public land of the United States within the State of California, and for the protection and encouragement of persons desirous of settling thereon.

To amend the law relating to mechanics' liens. Regulating the use of trade-marks.

To regulate the vocation of fishing, and to provide therefrom revenue for the restoration and preservation of fish in the waters of the State, requiring every person engaged in such vocation on the public waters of the State, who shall use a boat and net, to obtain a license for such fishing.

Appropriating \$10,000 to prevent the introduction of contagious and infectious diseases.

Providing for the incorporation of any church or other religious association.

Constitutional Amendments.—Three amendments to the State Constitution were submitted by this Legislature and voted upon by the people at an election held April 12. Two of these, relating to the Supreme Court of the State, failed of adoption. The third and successful amendment gives to cities containing a population of over 10,000 the same right to frame their own charter as that enjoyed under the Constitution by San Francisco and other cities of over 100,000 inhabitants. This right is exercised by the election of 15 freeholders of the city, who submit a draft of a charter, which must be approved by a majority of the voters of the city, voting at a general or special election, and by a majority of the State Legislature, before becoming law.

Finances.—In accordance with a provision of the Legislature of 1883, a portion of the State debt, represented by the State Capitol bonds of 1872, amounting to \$250,000, and maturing July 1 of this year, was discharged at that time. This payment reduced the bonded indebtedness of the State to \$2,703,500, of which the sum of \$2,698,000 in funded-debt

bonds of 1873 is interest-bearing. These bonds, with the exception of \$384,000 held by individuals, are all held in trust by the State treasurer for the support of the common schools and for the State University. They mature in 1893, and bear 6 per cent. interest.

The Controller's report shows that the State expenditures for the thirty-sixth and thirty-seventh fiscal years exceeded the two preceding years by \$2,622,591.74, necessitating an increase in the rate of taxation from 45.2 cents in 1884, to 56 cents in 1886. Yet, even at this increased rate the disbursements for the last two fiscal years exceeded the receipts by \$374,185.37. No less than fifty deficiency bills were passed by the Legislature of this year, as a result of this over-expenditure in various departments. The same body directed a levy of \$9,800,000 by taxation for the thirty-ninth and fortieth fiscal years, as against \$8,152,512 for two previous years.

The long-continued dispute between the State and the railroads, over the payment of taxes, is still unsettled. A test case, which was appealed to the United States Supreme Court in 1885 to determine the constitutionality of the assessment, was advanced upon the calendar, and heard in the latter part of that year. A decision adverse to the State was then given on a technical point raised by the defendants, leaving the main issues still to be decided. At the beginning of this year the State claimed from the Central and Southern Pacific roads and their branches, the sum of \$2,347,618.59 in unpaid taxes. Of this sum \$416,252.28 are due for the years 1880, 1881, and 1882; for 1883, \$222,251.23 of the sum of \$555,628.46 assessed are yet unpaid; for 1884 the assessment was \$653,373.12, of which the sum of \$323,852.49 is due; for 1885 and 1886 nothing has been paid, the taxes for these years being \$720,703.31 and \$664,559.18 respectively. A suit brought in the State Superior Court to collect the taxes for 1886 was decided in May against the State, on the ground that the provision of the State code prescribing a form of complaint to be used by the people to recover railroad taxes was unconstitutional. The railroads have thus far successfully evaded all attempts to force payment, and the State suffers great inconvenience and loss by this withholding of nearly 5 per cent. of her revenue.

Development.—The Governor, in his message at the beginning of the year, says: "The manifold industrial, mechanical, and commercial interests of the State are in a highly-prosperous condition; immigration is pouring in, property values are being enhanced, rich resources developed, and fields for labor are multiply-ing."

The following figures will show the condition of the chief industries: The product of wheat for 1886 is estimated at 1,070,000 tons; the total production of wool for 1886 was 47,225,160 pounds. This staple has shown some fluctuation in the last few years, the total for

1884 being 37,415,380 pounds, and for 1885 50,439,840 pounds.

The raisin industry has grown from a product of 180,000 pounds in 1881 to 14,060,000 pounds in 1886. Nearly all of this comes from three districts, the Fresno, the Riverside, and the Orange and Santa Ana. The total dried-fruit crop for 1886 was 20,745,000 pounds, against 5,070,000 pounds for 1883. In this total are included, besides raisins:

	Pounds.		Pounds.
Prunes	2,125,000	Pears	50,000
Apples	800,000	Grapes	175,000
Peaches	1,050,000	Apriots	600,000
Plums	583,000	Nectarines	50,000

Shipments of oranges from the State aggregated, in 1886, 25,966,830 pounds. Of this amount 21,513,880 pounds went from Los Angeles, 4,267,850 from Oolton, 81,300 from Sacramento, and 43,800 from San Francisco.

The product of extracted honey for the same year amounts to 6,000,000 pounds, besides 800,000 pounds of comb, and 80,000 pounds of bees-wax.

The vintage of 1887 was 15,000,000 gallons, or nearly the same as in 1884. It reached 17,000,000 gallons in 1886.

The salt-water fisheries have flourished, but of the principal inland-fishing industry, the Commissioners of Fisheries say: "It is a matter of serious regret that our choicest and most valued fish, the Quinnot salmon, is annually decreasing, and the supply for exportation and home consumption is diminishing. On account of the small run, and decreased take of salmon, more than half of the canneries that were operated in 1883-'84 were closed in 1885-'86. The number of cases packed in 1885 was 90,000, as against 120,000 for 1883, and 200,000 for 1882. In 1882 nineteen canneries were in successful operation, while in 1885 only five or six were running."

By the report of July, 1882, made to the Bank Commissioners, the deposits of the savings-banks of San Francisco amounted to \$46,869,689.91. The report of the same banks for January, 1887, shows a deposit of \$57,586,741.81, a gain of \$11,117,051.40, or of \$2,779,262.85 per year. The savings-banks outside this city gained in the same period \$1,770,349.86. The total gain for the whole State in four years was \$12,887,400.76, and the total deposits at last report was \$66,196,189.54. The population of California is put at a million, and the deposits in her savings-banks, which are largely the surplus earnings of her wage-workers, equal \$66 to each man, woman, and child in the State.

The assessed value of railroad property is slightly over \$7,000,000. There were operated in 1886 in the State 2,425 miles of broad-gauge, and 426 miles of narrow-gauge road. The total assessed valuation of the State was for 1885, \$761,271,449; for 1886, \$768,395,600.

Education.—The State supports a normal school at San José, and a branch normal school at Los Angeles, both of which are flourishing;

the former having in 1886 an average of 430 pupils, and the latter 252. Provision was made by the Legislature of this year for the establishment of a second branch school in Northern California.

The public schools are supported by income from State bonds, by the State school fund, and by local taxation. In 1885 the Superintendent of Public Instruction apportioned to them from the State fund \$1,845,883; in 1886, \$2,012,235; in 1887, \$1,528,641. The State University and the normal schools are supported by special appropriations. The school law forbids the use of the school fund for the support of any schools other than of the primary and grammar grades, but permits districts or municipalities to maintain high-schools by a local tax. An amendment to the State Constitution, adopted in 1884, created a State board to prepare a series of text-books to be exclusively used in the common schools of the State; and several elementary books, compiled by leading educators of the State, have been published. The present Legislature appropriated money for a continuation of the series, and directed that a suitable treatise on the injurious effect of alcoholic liquors should be included in it.

The total valuation of school property for 1886 was \$8,920,984, a gain of \$493,797 over 1885, and of \$984,864 over 1886.

Mention has already been made of the generous provision of the Legislature for the State University. Higher education in the State will be still further advanced by the founding of Stanford University, the corner-stone of which was laid at Palo Alto, with appropriate ceremonies, on May 20. The founder, Senator Stanford, contemplates the establishment of an institution of the highest standard, richly equipped and endowed.

Charities and Prisons.—In the last two fiscal years the State expended for the orphan asylums, \$448,526.33; for aged persons in indigent circumstances, \$123,145.56; for the Veterans' Home, \$20,918.60; and for the Home for Feeble-Minded Children, \$37,189.44, making a total for charitable institutions of \$624,724.93.

It also supports a school for the deaf, dumb, and blind, at which 186 persons have received instruction during the last two years. A separate institution for the adult blind was provided for by the Legislature of 1885, but unfortunate management has partially defeated the purposes of the act.

There are two insane asylums, the one at Stockton having 1,486 patients in 1886, an increase of over 185 per year during the last two years. The asylum at Napa held in 1886 1,486 patients, and two years previous 1,819, showing an increase of 117, or less than half that of Stockton. An asylum for the chronic insane in Santa Clara County was completed in 1887.

The State Prison at San Quentin contained

at the close of the fiscal year, 1886, a total of 1,247 prisoners, or 85 more than in 1885. At Folsom there were 644 prisoners, an increase of over 80 in one year.

Southern California.—A recent writer says: "That California can much longer remain one State, is not probable. The project of a division has been widely discussed, and it is now conceded that the work of separation can not be delayed beyond a very few years. The reasons are based upon causes so deep-seated, and dependent upon geographical and topographical, as well as climatic differences so radical, that the union already works serious detriment to the southern portion of the State and retards its progress. Between the two lies a great transverse range of mountains, the lowest passes of which vary from 4,000 to 5,000 feet above the sea. It is this range, with the absolute division it makes in the lines of trade and travel, which, more than any other one cause, is forcing them apart."

The most wonderful growth of recent years in California is exhibited in and around Los Angeles. This place is a century old (it celebrated its centennial in 1881), and exhibits a curious combination of the ancient and the modern. It is from 350 to 500 feet above sea-level. In 1854 the population of the town was about 4,000, of whom only 500 were Americans; the population is now about 70,000. Wine has been produced here for many years, and some fine samples were sent to President Buchanan in 1857. Now the county contains 22,000 acres devoted to grapes for wine-making, and produces 5,000,000 gallons yearly. Other fruits grown in abundance are oranges, lemons, figs, limes, almonds, peaches, apples, cherries, guavas, melons, olives, pomegranates, and quinces. The city owns the Los Angeles river, and sells the water for irrigation of orange-groves. It has cable street-railways, an opera-house, a crematory, twenty-nine churches, numerous schools and benevolent institutions, and a free public library. It is the seat of the University of Southern California, founded in 1880. There are eleven banks, nine iron-foundries, two flouring-mills, five planing-mills, a pottery, brick-yards, and establishments for the manufacture of soap, cigars, ice, brooms, artificial stone, mattresses, furniture, beer, pickles, candy, jewelry, hats, lithographs, leather, and street-cars. Fifteen lines of railway, either completed or in course of construction, pass into or through the city. There are two harbors, one thirteen and the other twenty miles distant. The assessed valuation of property in the city in 1887 was \$40,000,000, the real value being over \$100,000,000.

Immense quantities of honey, wheat, and barley are produced in this part of the State, besides corn, castor-beans, English walnuts, and other crops. Most of the towns are growing rapidly, numerous health and pleasure resorts are being established, and there is

a constant influx of settlers and capital. It is estimated that by 1890 Southern California will have 1,000,000 orange-trees of bearing age. In the production of grapes, the most important of which is the raisin-grape, the following is the acreage in the five counties comprising Southern California in the present year compared with that of last year:

COUNTIES.	Acreage, 1886.	Acreage, 1887.
Los Angeles	15,560	17,180
Santa Barbara	900	1,125
Ventura	830	456
San Diego	774	1,090
San Bernardino	3,470	4,090
Total	21,556	24,885

Improved land for the business of cultivating raisin-grapes is valued at from \$100 to \$500 per acre, the third year yielding \$25 per acre, the fourth year \$50 per acre, the fifth year \$100 per acre, and when the vines are in full bearing, from \$100 to \$300 per acre. The vineyards of California yield from six to eight tons per acre in full bearing, while in Malaga, the yield is less than two and a half tons to the acre. Statistics show that California is furnishing for home consumption a little more than a third of the amount of raisins imported.

The petroleum and asphaltum supply of Southern California are among the largest and richest in the world. A single well in the Pico Cañon has produced within the past nine years about \$1,000,000 worth of oil, and is still producing steadily. The peculiar feature of the oil-wells of this section is their permanence. Petroleum and asphaltum were discovered here by the first Spanish settlers more than a century ago, but no attention was paid to the oil, while asphaltum was melted and used as roofing. The oil region of Southern California extends from the northern part of Santa Barbara County, along the coast through that county, thence a few miles inland through Ventura and Los Angeles Counties, 160 miles. From the San Fernando wells the oil is carried in a pipe to Newhall station and refinery, on the Southern Pacific Railway, and also down the Santa Clara valley to the sea, at the ports of Hueneme and San Buenaventura. The oil from Santa Paula is conveyed in the same way to Newhall and to the sea. The amount of capital invested in the business of production and development is about \$3,000,000. (See "California of the South," by Walter Lindley and J. P. Widney, New York, 1888.)

CANADA, DOMINION OF. The fifth Parliament of the Dominion was dissolved on Jan. 15, 1887, and in the elections that followed the government of Sir John Macdonald was sustained, but by a greatly reduced majority. The sixth Parliament met on April 13, elected Lt.-Col. Joseph Alderic Ouimet speaker, and was prorogued on June 24. The Government, when it met Parliament, was composed as follows: Premier, President of the Privy Coun-

oil, and Superintendent-General of Indian Affairs, Rt. Hon. Sir John Macdonald, G. O. B.; Minister of Finance, Sir Charles Tupper; Postmaster-General, A. W. McLelan; Minister of Public Works, Sir Hector Langevin; Minister of Railways and Canals, J. H. Pope; Minister of Customs, Mackenzie Bowell; Minister of Militia, Sir Adolphe Caron; Minister of Marine and Fisheries, G. E. Foster; Minister of Agriculture, John Carling; Minister of Inland Revenue, John Costigan; Minister of the Interior, Thomas White; Minister of Justice, J. S. D. Thompson; Secretary of State, J. A. Chapleau; without portfolio, Frank Smith. Sir Charles Tupper resigned temporarily the office of Canadian High Commissioner in London, in order to become Minister of Finance. During the session, John J. O. Abbott, Mayor of Montreal, entered the Cabinet without portfolio and became the leader of the Senate, and Edward Blake resigned the leadership of the Opposition on account of failing health, being succeeded by Wilfrid Laurier. The sanction of Parliament was obtained for a radical reorganization of the Dominion Cabinet, but the carrying of the changes into effect was postponed. Provision was made for uniting the two departments of Customs and Inland Revenue, as the Department of Trade and Commerce. When the law comes into force, the offices of Minister of Customs and Minister of Inland Revenue will cease to exist, but each of the departments then united will still have a parliamentary head, who will hold office and retire with the Government, but will not necessarily or probably be a member of the Cabinet. The duties of these officers, who will be called, respectively, the Controller of Customs and the Controller of Inland Revenue, will be analogous to those of the Under Secretaries in the Government of Great Britain. Provision was also made for the appointment of a Solicitor-General, who will occupy a similar position in the Department of Justice.

Finance.—The ordinary revenue for the fiscal year ending June 30, 1886, was \$38,177,040, and the ordinary expenditure \$39,011,612, thus leaving a deficit of \$5,834,572. The deficit is partly accounted for by payments during 1886 on account of the Northwest rebellion of 1885, amounting to \$3,177,220. The ordinary revenue averaged \$6.92 per head of the population, and the expenditure \$8.18. The gross amount of taxation was \$25,226,456, or \$5.26 per head. The gross public debt on June 30, 1886, was \$273,164,841, an increase during the year of \$3,460,734. The net debt was \$223,159,107, an increase of \$26,751,415. The expenditure on public works since confederation has been as follows: Railways, \$97,056,423; canals, \$29,876,800; light-houses and navigation, \$8,284,580; acquisition and management of the Northwest Territories, \$5,356,086; Government buildings and miscellaneous works, \$18,680,829; total, \$154,254,667. Prior to confederation \$52,944,175 had been expended on

railways and canals, and \$10,690,917 on other public works.

Trade and Commerce.—The imports for the year ending June 30, 1886, amounted to \$104,424,561, and the exports to \$85,251,814, a decrease in the imports from the previous year of \$4,516,925, and in the exports of \$3,987,047. The commerce of the Dominion was thus distributed:

Iron.—The most important legislation accomplished was the extension of the national policy with a view to fostering the manufacture of iron, and the new tariff was graded in proportion to the presumed value of the labor involved in producing iron in its various stages of manufacture in Canada. As a general principle, the rate of duty is about equal to two thirds of the amount of the duty payable in the United States. This principle was not adhered to in the case of the higher grades of steel manufactures, because it was thought that no amount of protection would insure the manufacture of these grades in Canada, nor in the case of locomotive tubes and boiler-plates, because it was especially desired to encourage railway development in Canada. Nova Scotia and British Columbia are the only Canadian provinces in which iron and coal are found in close proximity, but the Government hope to see re-established under the new tariff the charcoal-iron manufactures, which were once the chief industries of Ontario and Quebec. The imports of iron and steel and manufactures thereof into the Dominion for home consumption in recent years have been: 1879, \$7,962,295; 1880, \$10,128,660; 1881, \$12,955,855; 1882, \$17,199,488; 1883, \$20,080,274; 1884, \$14,790,727; 1885, \$11,415,713; 1886, \$11,053,865. The Dominion pays a bounty of \$1.50 a ton on all pig-iron manufactured in

Canada, and this bounty will continue until June 30, 1889. From that date until June 30, 1892, the bounty will be \$1 a ton. The amount of bounty paid during the fiscal year ending June 30, 1886, on pig-iron manufactured in Canada was \$39,269.56. The amount paid for bounty between July 1, 1886, and May 1, 1887, was \$32,667.65.

Treaty-Making Power.—Sir Charles Tupper, in his budget speech, announced that the Imperial Government had decided to allow the Dominion to negotiate its own commercial treaties with foreign countries; negotiations to be conducted conjointly by the representative of Canada and the minister representing Her Majesty's Government, the former being clothed with plenipotentiary powers and placed upon an equal footing with the latter. He quoted the following extract from a letter sent by the Foreign Office to the Colonial Office, dated July 26, 1884, and referring to proposed commercial negotiations between Canada and Spain:

If the Spanish Government are favorably disposed a full power for these negotiations will be given to Sir Robert Morrier (then British Ambassador at Madrid) and Sir Charles Tupper jointly. The actual negotiation would probably be conducted by Sir Charles Tupper, but the convention, if concluded, must be signed by both plenipotentiaries, and be entered into between Her Majesty and the King of Spain, with the special object of regulating Canadian trade with the Spanish territories specified in the convention.

Irish Home Rule.—The following resolutions were passed by the House of Commons on a division of 135 against 47:

That the Parliament of Canada in the year 1889 adopted a humble address to Her Most Gracious Majesty the Queen expressing the hope that a just measure of home rule would be granted to the people of Ireland; and

That in the year 1886, by resolution of the House of Commons, the sentiments of said address to Her Most Gracious Majesty were earnestly reiterated and the hope again expressed that such a measure of home rule would be passed by the Imperial Parliament; and

That such measure of home rule has not been granted to the Irish people, but, on the contrary, there has been introduced into the Imperial House of Commons by Her Majesty's Government a bill enacting the most stringent coercive measures for Ireland, by which the Irish people will be deprived of rights most dear to all British subjects.

That this house has learned with profound regret of the introduction into the Imperial House of Commons of the Coercion bill above mentioned, and earnestly hopes that a measure so subversive of the rights and liberties of Her Majesty's subjects in Ireland may not become law.

That this house again expresses the hope that there may speedily be granted to Ireland a substantial measure of home rule, which, while satisfying the national aspirations of the people of Ireland for self-government, shall also be consistent with the integrity of the Empire as a whole.

That the granting of home rule to Ireland will fittingly crown the already glorious reign of Her Most Gracious Majesty as a constitutional sovereign, will come with special appropriateness in this her Jubilee year, and, if possible, render Her Majesty more dear to the hearts of her already devoted and loyal subjects.

Inter-Provincial Conference.—In October, delegates duly accredited by the governments of Quebec, Ontario, Nova Scotia, New Brunswick, and Manitoba met at Quebec to consider propositions for the amendment of the British North America act of 1867, of the Imperial Parliament, which embodies the constitution of the Canadian Confederation. Since this act, which was based upon a series of resolutions formulated by a similar conference, was passed, difficulties have from time to time arisen between the Federal and provincial governments and legislatures as to its interpretation, necessitating appeals to the Privy Council in England to decide upon the constitutionality of acts of the Dominion Parliament and Legislatures. Most of the provincial governments of the present day belong to the Liberal party, while the Dominion Government is Conservative, and the issue between the advocates of provincial autonomy and the advocates of centralization of governing power at Ottawa has naturally assumed great importance. As a matter of fact, most of the resolutions adopted by the Conference were in favor of increasing the powers of the provincial authorities. The delegates were, for Ontario: Oliver Mowatt, Prime Minister; O. F. Fraser, Commissioner of Public Works; A. S. Hardy, Provincial Secretary; A. M. Ross, Provincial Treasurer; G. W. Ross, Minister of Education. For Quebec: Honoré Mercier, Prime Minister; D. A. Ross, Arthur Turcotte, Joseph Shehyn, Provincial Treasurer; C. A. E. Gagnon, Provincial Secretary; James McShane, Commissioner of Public Works; George Duhamel, Solicitor-General; F. G. Marchand, Speaker of the Legislative Assembly. For Nova Scotia: W. S. Fielding, Prime Minister; J. W. Longley, Attorney-General; A. MacGillivray. For New Brunswick: Andrew G. Blair, Prime Minister; and David McLellan, Provincial Secretary and Receiver-General. For Manitoba: J. Norquay, Prime Minister; and O. E. Hamilton, Attorney-General. Twenty-two resolutions were adopted (subject to the approval of the several provincial legislatures) as the basis upon which the British North America act should be amended. The resolutions provide for amendments to the following effect:

That the power of disallowing provincial statutes be taken away from the Dominion Government and placed in the hands of the Imperial Government, to be exercised in regard to provincial legislation upon the same principles now recognized in regard to Federal acts.

That, to prevent the Federal Parliament assuming powers belonging exclusively to the provincial legislatures, equal facilities be afforded to the Federal and provincial governments for testing the validity of Federal or provincial statutes. That constitutional provision be made for obtaining judicial determination on such acts, as well before as after they are enforced, the decisions to be subject to appeal as in other cases in order to obtain final adjudication.

That, to prevent uncertainty and litigation, the constitutionality of statutes should not be open to question by private litigants, except within a limited time (say two years) after their passing. After the lapse

of that period the constitutionality of a statute to be questioned only at the instance of a government, and, if it is then declared unconstitutional, the act to be regarded as if originally enacted by and to be subject to amendment or repeal by the legislature or parliament having the jurisdiction to enact it.

That half the Senators of the Dominion be chosen by the provinces, and that all the Senators hold office for a limited term of years, not as now, for life.

That the British North America act should expressly declare the lieutenant-governor of each province to have the same executive authority as the governors and lieutenant-governors of other British colonies. Hitherto this right has been assumed, but it is deemed necessary to maintain it and place it beyond question by an express provision.

That the Federal authorities shall no longer have the power of withdrawing from provincial jurisdiction, local works (railways, for instance, situated entirely in one province), merely by declaring them "to be for the general advantage of Canada."

That the provincial legislatures should control the Dominion franchise; the electoral lists prepared for the elections to the legislative assemblies to be used in elections to the Dominion Parliament.

That all doubts be removed as to the right of the provincial authorities to appoint all magistrates and other officers under the control of the provincial legislatures.

That the provincial legislatures be authorized to legislate with regard to fees payable on legal proceedings, and to apply the revenue therefrom to provincial purposes.

That, to remove doubts now existing, it be expressly declared that lieutenant-governors have the power, subject to provincial statutes, to issue commissions to hold courts of assize and nisi prius,oyer and terminer, and general jail-delivery. At present the uncertainty is such that by arrangement between the Federal and provincial authorities independent commissions expressed in identical terms are issued by the governor-general and by the lieutenant-governor of each province.

That the provincial legislatures should have the same powers to define the privileges and immunities of their houses and of their members individually that are now enjoyed by the Dominion Parliament.

That Her Majesty may by proclamation abolish the legislative council of any province upon an address in favor of that step, concurred in by at least two thirds of the members of the House of Assembly of that province.

That the claim made by the Federal Government to all crown lands as to which there was no treaty with the Indians before confederation, be declared invalid.

That in the absence of a Dominion insolvency law each province be allowed to legislate upon the matter, subject to any future insolvency law that may be passed by the Parliament of Canada.

That the pardoning power for the infraction of provincial laws be reposed in the lieutenant-governor in council of each province.

That the boundaries between Ontario, Manitoba, and the remainder of the Dominion, as far as determined by the Privy Council, should be established by Imperial statute, and that the whole northern boundaries of Ontario and Quebec be determined without further delay.

That the annual subsidies payable by the Dominion to the provinces be increased, and the increased amount be declared by Imperial enactment to be final and absolute, and not within the power of the Federal Parliament to alter. The annual subsidies provided by the British North America act were as follow: Ontario, \$80,000; Quebec, \$70,000; Nova Scotia, \$60,000; New Brunswick, \$50,000, with a further annual grant equal to eighty cents a head of the population as ascertained by the census of 1861, with special provision for Nova Scotia and New Brunswick. The Conference suggests that the subsidies be

as follow: Where the population is under 150,000, \$100,000; where the population is 150,000, but does not exceed 200,000, \$150,000; where the population is 200,000, but does not exceed 400,000, \$180,000; where the population is 400,000, but does not exceed 800,000, \$190,000; where the population is 800,000, but does not exceed 1,500,000, \$220,000; where the population exceeds 1,500,000, \$240,000, and an annual grant of eighty cents a head, to be based upon the population of each province as ascertained at each decennial census, until the population exceeds 2,500,000; and of sixty cents a head for so much of the population as exceeds 2,500,000. Special provision is made for British Columbia and Manitoba.

That the provincial legislatures should take steps to secure the enactment by the Imperial Parliament of amendments to the British North America act, in accordance with the resolutions embodying the foregoing suggestions.

The Conference also dealt with certain matters in respect whereof no amendments to the British North America act are required, passing resolutions making recommendations to the following effect:

That the provincial legislatures should enact that no action shall lie against any judge or officer for any act done under the supposed authority of any statute subsequently declared *ultra vires* of the parliament or legislature enacting it, provided the action would not lie if the statutory provision had been within such legislative jurisdiction.

That the laws of the several provinces for the enforcement of debts should be assimilated as far as may be consistent, with the different legal systems prevailing; and that such assimilation should include provisions against preferences by insolvent debtors; for the examination of debtors, and for taking speedy possession of an insolvent's estate for the benefit of his creditors, so far as these subjects can be dealt with by the provincial legislatures.

That legislative provision be made in all the provinces for rendering effectual in all of them probates and letters of administration granted in any one of them.

That similar laws be passed in all the provinces with respect to probates and letters of administration granted in the United Kingdom, to go into effect when probates and letters of administration granted in the Dominion are by Imperial legislation made effectual in the United Kingdom.

The foregoing resolutions were concurred in by all the delegates. A resolution condemning the disallowance by the Federal Government of the Red River Valley Railway charter was passed, the New Brunswick delegates dissenting. A resolution was also passed in favor of commercial union with the United States, but as this subject is not within the jurisdiction of the provinces, the chief importance of the resolution lies in the fact that it commits the Liberal party to the policy of commercial union so far as the party can be committed, by the formal declaration of so many of its chiefs. The Conference adjourned on October 28.

CAPE OF GOOD HOPE, a British colony in South Africa. The legislative authority is exercised by a Legislative Council, consisting of twenty-two members, elected for seven years, and a House of Assembly of seventy-four members, elected for five years. By a law passed in 1882, speeches in the Cape Parliament may be made in either English or Dutch. The Governor of the Cape of Good

Hope and High Commissioner for South Africa is Sir Hercules George Robert Robinson, appointed in 1880. The Prime Minister is Sir Gordon Sprigg.

Area and Population.—The area of Cape Colony proper is 199,406 square miles, and including its dependencies, 281,276 square miles. The population of Cape Colony proper in 1881 comprised 269,725 persons of European origin, and 541,725 others. The estimated population of the colonies and its dependencies in 1885 was 1,252,347. The dependencies are Griqualand West, with an area of 17,800 square miles, and 16,927 white and 32,174 colored inhabitants; the Transkei, area, 2,585 square miles, population 820 whites, and 118,782 others; Griqualand East, area, 7,480 square miles, population, 3,066 whites, and 98,114 others; and Tembuland, area, 8,320 square miles, population, 8,320 whites, and 114,818 others. The capital of the colony is Cape Town, which has about 60,000 inhabitants. A large proportion of the white people of the colony are descended from the original Dutch, French, and German settlers. The immigration in 1884 was 292.

Basutoland, with an area of 10,290 square miles, and 128,000 inhabitants; Bechuanaland, with 180,000 square miles, and 478,000 inhabitants; and Pondoland, with 200,000 inhabitants, are British possessions, directly under imperial jurisdiction.

Commerce.—The total value of imports in 1885 was £4,772,904, and of exports, £3,159,487, exclusive of specie and diamonds. The export of wool was valued at £1,426,108; ostrich-feathers, £585,278; hides and skins, £424,755; copper-ore, £395,675; Angora hair, £204,018; wine, £17,245. The value of diamonds exported was £2,489,659. Including gold and diamonds, the total value of exports was £5,811,444.

The railroad mileage at the close of 1885 was 1,599. The gross earnings for the year were £1,087,859, and the expenses, £672,489. The number of letters carried in the mails in 1885 was 6,244,169, and of newspapers, 8,986,124. The telegraph lines at the end of 1885 had a total length of 4,329 miles; the number of messages for the year was 798,468; the revenue, £52,458; the expenditures, £45,080.

Finances.—The revenue for the year ended June 30, 1887, was £3,155,000, which was balanced by the expenditure. The estimated revenue for 1887-'88 is £3,186,000, and the estimated expenditure £3,147,000. The finances of the colony are steadily improving.

Disfranchisement of Natives.—When responsible government was granted to Cape Colony in 1858, the Constitution was framed so as to secure equal political rights to whites and blacks. The idea of political equality of the races is obnoxious to the Afrikaner population, although the natives have not abused the privilege of voting, have made scarcely any use of it, and are not able, if they should all vote, to

influence the results of elections, except in a few constituencies. In 1887 the Cape Legislature passed a bill to deprive of the franchise all natives whose qualifications are derived from communal occupation, the effect of which will be to disfranchise nearly all natives who can now exercise the right of voting. A petition to have it disallowed by the Imperial Government was made through the English society for the protection of aborigines, but was not entertained.

Proposed Customs Union.—Cape Colony and Natal have entered into a competition with each other for the increased trade of the Dutch republics resulting from the gold discoveries in the Transvaal. The customs duties were almost entirely abolished by the two colonies, to the detriment of their revenues and the benefit of the Transvaal and the Orange Free State. A proposition for a conference to discuss a customs union of all the South African countries, and the question of railroad connections was favorably received in the republics, but the British colonies find it difficult to harmonize their reciprocal interests, since the free admission of sugar from Natal into Cape Colony would entail a heavy loss of revenue on Cape Colony, and the sacrifice of a profitable trade with Mauritius, without any resulting benefit. The Cape Government is extending the Kimberley railroad to the Vaal river, and railroads from the east coast into the Free State or the Transvaal are under discussion. In the mean time the Delagoa Bay Railroad project is being carried out by the South African Republic, which found a Belgian syndicate ready to take the concession.

Annexation of Zululand.—By a convention concluded on Oct. 22, 1886, between the British Government and the Boers who had established a new republic in Zululand on the borders of the Transvaal, and had proclaimed a protectorate over the entire Zulu nation, the partition of the country between the Zululand Republic and the Zulus was agreed to, the Boers, in return for the recognition of their republic, giving up all rights over Eastern Zululand, and surrendering a part of the territory that they had already occupied. A large proportion of the valuable lands in Zululand were included in the Zulu Reserve, over which a British protectorate had been established, and the greater part of those that were left were contained in the New Republic. Eastern Zululand, the section still retained for the possession of the natives, consisted to a large extent of marshes and fever-scourged areas, yet enough of good land remained, in the opinion of the British negotiators for the maintenance of the diminished Zulu nation. In the district of Kwamagaza, east of the boundary-line, 400 Boers had settled on 80 farms, and the British promised that their titles should be respected. Within the borders of the New Republic lived about 40,000 Zulus. The district of Umgojana, north of the Umkusi river, forming a wedge

between Eastern Zululand and Swaziland, and another tract on the south, next to the Reserve, and jutting likewise into Eastern Zululand, were added to the bounds of the republic as a compensation for lands that were given back to the Zulus in the center. This arrangement was made for the sake of securing to the English the main trade-route. The Boers agreed to allow free passage for goods across the territory of the New Republic, without payment of license or transit dues, into the South African Republic or Zululand. The area of the New Republic is 2,700,000 acres, or about half of Zululand outside of the Reserve, leaving the Zulus one third of their former country, and not more than one fifth of its habitable portions. The Natal Legislative Council complained against being excluded from the negotiations. The people in Natal were as desirous of securing grazing-farms and collect a hut-tax in Zululand as the Boers. Resolutions were passed in favor of the immediate extension of British authority over the whole of Zululand, except the Boer republic, and proposing its annexation to Natal. When the demarkation was begun, on Dec. 14, 1886, Dinizulu, who pretended to be King of the Zulus, with other chiefs, instigated by their white friends, attempted to upset the convention and have the Boers either driven out of Zululand altogether, or deprived of a large slice of the territory that had been conceded to them. They were rebuked for their desire to reopen the question. The boundary survey and demarkation was completed on January 26, and on the 28th the British boundary commissioner, Mr. Osborn, summoned Dinizulu and the other chiefs to ratify the settlement. They were not permitted to bring any of their white advocates to the meeting, or to communicate with their friends in Natal. They had previously sent a deputation to Sir Arthur Havelock, but could only induce him to negotiate with the Boers for the preservation of the burial-ground of their kings at Makosini. The Zulu chiefs refused to concur in the boundary, in the alienation of any part of their country to the Boers, or in the proposed extension over the rest of it of British sovereignty, but were informed that the arrangements were final and could not be altered.

A British protectorate was first proclaimed over Eastern Zululand. Mr. Osborn, the Resident Commissioner, sent messages in February, 1887, to the chiefs. Umyamana, one of Cetewayo's former counselors, was the only one who returned an acquiescent answer. Dinizulu and the rest made no reply. Subsequently the demand for annexation grew so strong among the English, that Eastern Zululand and the Reserve were declared to be a British possession from the 19th of May, 1887. Sir Arthur E. Havelock was appointed Governor of Zululand, and given authority to establish courts and legislate by proclamation, with the assistance of an advisory council, composed of

delegated members of the Legislative Council of Natal. The Queen's sovereignty was formally proclaimed on June 21 by Mr. Osborn, at Ekowe. Dinizulu and other chiefs refused pensions from the British, and on August 24 the late King left Eastern Zululand to establish his residence in the Boer republic, but subsequently returned to his former home, and, on renewing his demands, was threatened with punishment.

Swaziland.—The convention between Great Britain and the Transvaal Republic contained a stipulation that the British should not interfere in Swaziland. The discoveries of gold in Swaziland and the neighboring parts of the Transvaal quickened the interest of the English in this remote region, and furnished a new motive for the annexation of Zululand. The Swazi King, Umbandine, had sold the lands where gold was found to Boer graziers, but the diggers who flocked in paid him for mining rights, and he accepted the British doctrine that he still controlled the minerals, though most of his people sided with the Boers, who claimed the minerals under the soil. Theophilus Shepstone was sent as confidential adviser and commissioner to Umbandine, and was installed on Feb. 18, 1887. The Boers threatened to send a commando into the country in the winter, but were not upheld by the Transvaal Government. Mr. Shepstone called on all the farmers and miners to have their claims registered, and established a tariff of £20 for every mineral concession, and £5 for every trading license.

Amatongaland.—Preliminary steps were taken for establishing a British protectorate over Amatongaland. The Tonga Queen was persuaded, through fear of Portuguese encroachments, to petition for British annexation. In July, a treaty was concluded by which she bound herself not to make any treaty or cede any territory to a foreign power without the consent of the British Government. The Portuguese had come into conflict with the Tongas by asserting their claims to the territory north of the Maputa river, and 26° 30' south latitude, which was awarded to them by the President of the French Republic in the Delagoa Bay arbitration on July 24, 1875.

CARNOT, MARIE FRANÇOIS SADI, President of the French Republic, born in Limoges, Aug. 11, 1837. He is the grandson of Lazare Nicolas Carnot, Minister of War in the first republic from 1798 to 1797, whose genius and energy in raising and maintaining the army that repelled the allied enemies of the republic earned for him the title of the "Organizer of Victory." The son of the great Carnot, Lazare Hippolyte, inherited the instincts of republicanism. He became a St. Simonian, but turned from the socialists of that school when they adopted *Enfantin's* views of marriage. From 1839 till 1848 he was a deputy, and voted with the Extreme Left. Under the second republic he was Minister of Education, and after the fall of the

empire acted with the Extreme Left. Since 1875 he has been a life-senator. His son, to whom he gave the Persian name Sadi while interested in the study of Oriental languages and literature, was educated as an engineer. He entered the *École Polytechnique* in 1857, passing fifth in his class, led the class in the *École des Ponts et Chaussées*, and completed his professional education in 1863. After being for some time assistant secretary to the council for roads and bridges, he was appointed engineer at Annecy in 1864. He introduced improvements in railroad and bridge construction, and planned, among other important works, the great bridge over the Rhône at Collonges, near the Swiss frontier, where he applied a new system of tubular foundation of his own invention. On Jan. 10, 1871, he was appointed prefect of the department of Seine-Inférieure, and at Havre organized the national defense in Normandy, being nominated commissary-extraordinary for the departments of Seine-Inférieure, Eure, and Calvados. On February 8 he was elected by 42,000 votes as the representative of the department of Côte d'Or in the National Assembly. He took his seat with the Left, was chosen secretary of the group of the Republican Left, and voted for all the measures tending to the definitive establishment of the republic and in favor of all the constitutional laws. He was a member of various special committees on public works and industry, and advocated the bill relating to explosives. In the general election of Feb. 20, 1876, he was a candidate for deputy in the second circonscription of the arrondissement of Beaune, and was elected by a large majority over the combined vote of his two competitors. He was chosen secretary in the new Chamber, and was also a member of the budget committee. He was re-elected over the official candidate in the election of Oct. 14, 1877, took a prominent part in all the discussions relating to public works, especially railroads and canals, was several times appointed on the budget committee, and in 1878 was chosen to report the budget of Public Works. On August 12 of that year he was appointed under-secretary of state in the Ministry of Public Works. In the Ferry Cabinet of 1880 he was the head of that ministry, and prosecuted important works, on the development of which he had been engaged while Secretary of State. He was for a time Minister of Finance in 1882. In 1885, M. de Freycinet again called him into the Cabinet. He first took the portfolio of Public Works, but, on the retirement of M. Clamegeran, became Minister of Finance. In that office he had the same trouble with the budget as his predecessors, and was unable to induce the budget committee of the Chamber to adopt his general recommendations. Among other propositions that were defeated was one that he made to allow the Panama Canal Company to issue lottery bonds. He gained much credit for refusing to refund 75,000 francs of stamp duties that

the banker Dreyfuss claimed were illegally exacted, retiring from the ministry in December, 1886, when President Grévy insisted on the restitution. On Oct. 4, 1885, he was again elected deputy for the Côte d'Or. Sadi-Carnot has hitherto made himself conspicuous only by his professional accomplishments, and has never been a political leader, but he has won exceptional esteem by reason of his unquestionable integrity. On the retirement of President Grévy, the two great Republican orators, Ferry and Freycinet, were the principal candidates for the succession. In the first trial ballot of the Republican senators and deputies on the morning of Dec. 3, 1887, the former received 200 and the latter 193 votes, Brisson coming next with 81, and then Sadi-Carnot with 69. The election of Ferry threatened to produce a popular disturbance, and Freycinet's supporters, when they saw that his chance was hopeless, decided to give their votes to Carnot. When the Congress met in the afternoon, Sadi-Carnot received on the first ballot 303 votes, Ferry 212, Gen. Sausier 148, Freycinet 76, Gen. Appert 72, Brisson 26, and other candidates 81. M.M. de Freycinet and Ferry then withdrew in favor of Sadi-Carnot, who was elected on the second ballot by 616 votes, Gen. Sausier receiving from the Conservatives 186. President Carnot's wife is a daughter of Dupont White, who translated John Stuart Mill's works into French. Their family consists of four girls. M. Carnot has himself published a translation of Mill's essay on "The Revolution of 1848, and its Detractors" (Paris, 1875).

CARRIERS, MECHANICAL.—The term "store-service," first appeared in the Patent-Office "Gazette" in 1879, in connection with the invention of Joseph O. White, of New York, hereafter described, and two years afterward William S. Lamson, of Lowell, Mass., patented a "cash-carrier." Since that time about 800 patents have been issued in the United States alone bearing upon devices for the ready transmission of cash and small parcels in retail shops or other establishments where such service is required. At present one or another system is in use in a great many of the large mercantile houses where there is likely to be a rush of customers at certain hours or seasons. Almost every ingenious boy has at one time or another constructed some sort of rudimentary carrier, if only a match-box running upon a thread and pulled back and forth between the adjacent desks of school-room intimates. More complete structures are often seen stretching between the windows of neighboring houses in the country, and sometimes across city streets. But to Mr. Lamson apparently belongs the credit of having first brought skilled mechanical construction to bear upon the problem, and introduced cash-carriers as part of the necessary equipment of modern retail stores. Several companies now exist for the manufacture of these carriers, and the business is of such

magnitude as to justify some account of the various systems.

Carriers as used in store-service naturally divide themselves into two classes—cash-carriers, which are intended merely to expedite the making of change, and parcel-carriers, which do double duty, carrying the money to the cashier and the goods purchased to an “inspector,” who checks off the items of the purchase, and wraps the parcel for delivery. In large establishments, particularly in great cities, the advantage of such service is obvious, as it does away with the necessity of much running to and fro of messengers, which must necessarily interfere with the convenience of customers. The less costly systems are coming into use in small stores, and are found of almost equal advantage. The systems at present in use are, if not as numerous as the patents themselves, at least too many for description here; but the general mechanical principles involved are common to nearly all of them, the difference being in minor details of construction, which, however, are often of vital importance in enabling a merchant to de-

A PRIMITIVE CARRIER.

cide which system is best adapted to his special requirements. A large retail establishment in New York has lately spent about \$15,000 in setting up a store-service system; and where such an amount of money is involved, great care is naturally exercised to adopt only the best and simplest devices.

The rudimentary type of carrier is the school-boy contrivance already referred to, namely, a box or a basket sliding back and forth upon a horizontal cord. The first improvement is the substitution of a smooth wire for the cord, with the basket or car running upon wheels, and an arrangement for keeping the wire permanently tight. Such a system is indicated in Fig. 1. A B is the wire passing over a fixed pulley at A, and kept taut by the weight W. C is the car hanging on the wire ready for use, and C' an end view of the same showing the shape of the wheel attachment. Hand-power is used, a smart push or pull sufficing to send a properly-constructed car fifty or sixty feet. Such contrivances are used to advantage in

stores of moderate size where there is not apt to be an overwhelming rush of customers. The hand propulsion is, however, awkward and uncertain, and the next step is the introduction of the gravity-car, which appears in different forms and at frequent intervals throughout the Patent-Office reports. Fig. 2 shows it in one

A REVERSIBLE GRADE.

of its simplest forms. A B is the wire, C the cashier's desk, and S the salesman's station. At B the main wire is attached to an endless band running over two pulleys, and provided with a tension-spring at C. Obviously, by revolving the band B D upon the pulleys the point B can be raised or depressed as much as is necessary to change the angle of inclination of the wire and cause the car to run in either direction. In practice it is found that a rise of $\frac{1}{4}$ of an inch to each foot is enough to carry a properly-constructed car. Much ingenuity has been expended in devising methods of changing the level of wires. Fig. 8 shows one of the simplest and most effective (patent No. 271,895). The triangles (which may be simply arms) are pivoted at O C, and wires A B are stretched from one to the other. By reversing

REVERSIBLE DOUBLE WIRE.

the position of the triangles or arms, the inclination of the wires is changed as indicated by the dotted lines.

In Fig. 4 (patent No. 804,585) the necessity of raising and lowering the car is recognized. The wire A B passes over a fixed pulley at C,

and over a stationary rest at D. By pulling upon A the car E is raised almost vertically until it is high enough to clear D, when the angle of general inclination is reversed, and

LOWERING, HOISTING, AND REVERSING.

the carrier moves toward B. By this or a similar arrangement, the main line from C to B may be kept high enough to be out of the way, while the carrier alone is lowered to the counter.

The engraving shows only the mechanical principle. In the different systems used there are many ingenious appliances to render the operation of hoisting and lowering certain and easy. (See Figs. 8 and 9.)

Fixed rails for the transit of gravity-cars in store-service were patented by Joseph C. White, of New York, in 1879 (patent No. 221,488), under the title "An apparatus for facilitating payments and delivery of goods." The principle of the invention is shown in Fig. 5, C being the cashier's desk, and SSS the stations of salesmen. The cars were of the usual easily detachable type, so that the salesman could lift his car off from the rails if he

FIXED TRACKS.

saw it coming, but the necessity of making each car announce its arrival at its own particular station was at once apparent, and the inventor provided for it by means of projections upon the cars so placed and adjusted that each car

would ring a bell and derail itself at its own particular station. This was effected by setting the peg or projection at a different height on each car, and providing an inclined plane to correspond at each station. This is indicated in Fig. 6. A B is the inclined track, C and C' are cars, and the round black dots are the projections on each car. D and D' are small inclined planes fixed just below the main track. Car C in descending the incline will carry its projection clear of D', but will engage D,

DERAILING DEVICE.

while car C will be stopped by D'. In this way a considerable number of cars can be made to derail themselves, each falling into or against a suitable receiver. The inventor subsequently broadly claimed "Traveling carriers propelled along ways leading from store-counters to cashier's desk and back to counter through mechanism distinct from the carriers proper." The drawing in the Patent Office shows an endless belt running on suitable sup-

BALLS AND DIVERGENT RAILS.

ports in a horizontal plane, each car being hung upon the belt and detachable at pleasure. Under this patent the system of stoppages foreshadowed in the earlier claim was further elaborated.

Another phase of the gravity system was the early use of ball-carriers. This was the system adopted by Mr. Lamson before referred to, and alleged to have been the first actually in use. It contemplates in general the transmis-

sion of cash alone to and from the cashier's desk. Each carrier consists of two hollow hemispheres fastened together by any of the simple mechanical devices, and provided with interior springs which hold the coin and bills near the center of gravity after the two hemispheres are joined together. The balls are of as many different sizes as there are stations to be served, varying perhaps $\frac{1}{4}$ of an inch in their successive diameters. The railway consists in its simplest form of two slightly divergent rails (see Fig. 7) laid at a sufficient angle of inclination from the cashier's desk O, past the salesman's stations S S' S''. Now, suppose the three balls to be started on the incline from the cashier's desk, number 3 will fall between the rails at S, number 2 will follow suit at S', and number 1 will go on to the end of the line. Under the rails at each station is a net or pocket into which the balls drop convenient to the salesman's hand. For the return of the balls to the cashier a set of parallel rails is provided, inclined in the contrary direction, and various devices are resorted to for hoisting the balls to the rails where they are out of reach. Several systems provide baskets of different kinds, which are hoisted by pulley into position, and release the balls through various mechanical devices. One system adopts a flexible tube, large enough to receive the balls. The loaded ball is dropped into the open end of this tube which is hoisted, until the ball rolls out upon the rails, and goes its way. (See dotted lines in lower section of Fig. 7.)

Another plan provides a system of tubes communicating with a main tube leading to the cashier's desk, which must usually be on

BALL-CARRIER SYSTEM.

the floor below the salesroom. The small tubes rise through the counter, and the salesman merely drops in the balls destined for the cashier. They are returned to the salesman through a separate tube, or upon rails to which they are necessarily hoisted mechanically.

VOL. XXVII.—7 A

This is distinct from the pneumatic systems described farther on.

The best ball-carrier systems, as used at present, are either modifications of the divergent track, or use a parallel track with automatically-opening switches or traps, for the operation of which many most ingenious de-

GRAVITY PARCEL-CARRIER.

vices are employed. The fundamental idea of most of these is the impact of a moving ball against a trigger so placed that only a ball of a certain size can touch it. The trigger releases a catch, which allows a trap to fall open, or disengages a switch, like those of an ordinary railway, which turns the ball off upon a little side platform or cage that can be lowered to the counter if not within reach, or hoisted to the return track when desired. Fig. 8 shows a ball-carrier system in operation. The arrows indicate the direction of the balls going and returning. C is the cashier, and S the station with the automatic appliances for stopping the balls and lowering them to the counter.

Parcel-carriers have the advantage of doing double duty, since they serve as cash-carriers as well. A simple and effective one is shown in operation in Fig. 9. The hoisting-apparatus at the station S (similar to that shown in Fig. 4) raises the car to the wire, the wheels automatically adjusting themselves. Then the same apparatus hoists the wire itself till the grade is sufficiently changed. This system requires a separate wire for each salesman's station.

More elaborate systems use but a single fixed rail instead of a wire. Switches are provided at each station, and a simple hoisting-apparatus enables the salesman to lower the carrier or hoist it to either of the rails overhead. The switching devices used for carriers having wheels are similar to those described under ball-carriers, but are somewhat more direct and certain in operation. In Fig. 10, for instance, A is a frame set over the track, and B an attachment to a carrier. Each of these frames is pierced with holes, which register upon radii of the same circle. C is a pin, which can be set in any hole on the carrier,

and D is a lever connected with the switch. C can be shifted to register with D wherever placed, and thus a large number of carriers can run upon a single track, each turning off at its proper station, leaving the track clear. A similar arrangement, with the adjustment bars straight instead of curved, may be employed though the number of possible switches is considerably reduced in that case, owing to the limitations of space, and the unavoidable oscillations of a single-track car. With a double track, as in a cable system (Fig. 11), a nicer adjustment is practicable. The ends of the carriers in a single-track system are shaped with reference to possible collisions and are provided with buffers so that only a momentary delay results from a chance encounter. The carrying capacity varies, of course, with the strength of construction, but the ordinary retail business, where many customers carry away their purchases, seldom calls for a capacity of more than twelve or fifteen pounds.

The carrier-systems thus far described have depended for motive power mainly upon the always available force of gravity, but gravity is too slow for modern ideas and other means have been adopted. First among these, because simplest, is the "Spring Carrier." It consists of a single taut wire beneath which a small cash-carrier is suspended so as to be readily opened from below without detach-

SWITCHING DEVICE.

ing the car from the wire. The wire stretches from a salesman's station to the cashier's desk, and at each end is a spring either of rubber or wire operated by a handle and a releasing-clutch. The carrier can be sent almost instantaneously from end to end of the wire up to a distance of 150 feet. The longest line in operation in New York is 180 feet. This system commends itself for inexpensiveness and simplicity, and is especially adapted for use in shops of moderate size.

One of the most elaborate of the modern cash-carriers is precisely similar in general construction to cable railways as described in the "Annual Cyclopædia" for 1886. The minor

details involving automatically-acting switches are different and merit a description.

The cable is simply an endless wire running over drums at the ends, and bearing upon sheaves wherever necessary in passing curves or the like. The cable runs between light rails

A CABLE-CARRIER.

upon which the carriers slide, and a guide-rod provides against accidental derailment in transit. In Fig. 11 the arrows show the direction of motion in the cable. A is the carrier, and B a lever acting upon the cable-grip C. The salesman has several of the carriers within reach, and when he wishes to send one to the cashier he raises the lever B, and sets the carrier upon the rails in a position it necessarily assumes. Placing his finger upon the lever B, he presses it downward; the grip C closes upon the moving cable, and the carrier disappears so swiftly that the eye can hardly follow, perhaps plunging down through an opening in the floor to the cashier's department, whence it is returned at a like rate of speed, and switches itself off upon a little platform at the proper station. The switching device is unlike any of those described, in that a thin curved piece of metal is fixed at each station in such a position that it engages projections set on top of the carrier and derails it at the proper point. First, however, the cable-grip is automatically released by an inclined fixture against which the lever B strikes just before reaching the switch. At the switch there is a break in the guide-rod D, so that the carrier is free to leave the rails and falls into a suitable receptacle. The whole structure of rails, guide-rods, and supports occupies very little space, and can be so disposed as not to be in the least unsightly or inconvenient. The motive power can be derived from any available source—steam, electricity, water, or the like.

It remains to notice the pneumatic systems which are operated through tubes of glass or metal, either by exhaust-engines or by means of compressed air. These systems necessitate a special tube for each salesman's station, all converging at the cashier's desk. The tubes are about two inches in diameter, and the carriers are cylindrical, fitting the tube loosely,

but provided with an elastic attachment which fills the tube and prevents the passage of air. In the exhaust or vacuum systems the air is drawn from the tube in front of the carrier, and the motive force is derived from the natural atmospheric pressure of about fifteen pounds to the square inch. The air current has to be kept up constantly in order to afford a uniform and trustworthy service, and the circulation of air is an important consideration in a crowded establishment.

In the systems operated by compressed air the current is in motion only when actually required. In stores of moderate size, foot-power air-pumps are used, with highly satisfactory results. The fixtures at either end of such a line are shown in Figures 12 and 13, the tubes being carried under the counters or floors, or overhead if more convenient. A salesman (Fig. 13) is represented in the act of sending a carrier. After dropping the carrier into the receptacle he turns the small handle at the side, closing a valve within the tube, and then steps upon the air-pump lever. A slight pressure only is necessary to deliver the carrier in an instant at a distance of 150 feet. Releasing the handle, the valve opens automatically, and the tube is ready for the return carrier. If the valve at either end is closed, the operator at the other end is instantly aware, from the

CASHIER, PNEUMATIC SYSTEM.

resistance of the air-pump, that the tube is not clear. At the delivery end the carrier is shot out, falling upon a cushion, as shown in the engraving of the cashier's desk (Fig. 12). In

large establishments a central air-compressor is worked by machinery, and no foot-power is required, the compressed air being furnished from a central receiver, and turned on by salesmen or cashier as required at each station.

Cash and parcel carriers are generally rented

SALESMAN, PNEUMATIC SYSTEM.

out to merchants at so much a station, the price ranging from \$15 to \$30 per annum. Each station is supposed to be equivalent or superior in efficiency to the average cash-boy, without any of his mischievous propensities. The saving, therefore, in wages and responsibility is very considerable where a good store-service system is introduced.

CHEMISTRY. Chemical Philosophy.—The determination and graphic representation of the constitution of matter, is the subject of one of the most notable of recent papers in this department of chemical science. The article appeared in "Nature," and begins with the declaration that the growth of the science of organic chemistry is to be measured, not so much by the innumerable new compounds which it has brought to light, as by the unfolding of its doctrine of constitutional formulæ, this being the particular contribution which it has been able to make toward solving the central problem of all chemistry—the constitution of matter. That as a whole these formulæ

stand for representations of what is real is attested by the fact that the most successful experimenters of the day confess to having been guided by them at almost every step of their researches. A modern constitutional formula takes the various atoms of a compound in the proportions indicated by the empirical formula, and in the absolute number prescribed by the molecular weight, and arranges them in the way which, within the limits of the law of valency, will best account for the reactions of the compound. The doctrine of these formulæ originated in the difficulty of explaining isomerism under Dalton's law of atomic weights, and of indicating it by his empirical formulæ. The phenomena of isomerism did not militate against the theory of atoms, but really gave it support; for while they were incongruous with the other theories of matter, they were susceptible of explanation under the hypothesis that it consists of atoms variously arranged. From this point of view it was necessary to determine, so far as possible, the mode of arrangement of the atoms in the different compounds. The results of this attempt are embodied in the constitutional formulæ. The method resorted to in solving this problem was similar to that which had been employed in determining the ultimate composition of compounds. Just as when, after isolating from a compound, or introducing into a compound, some particular kind of elementary matter, chemists concluded that the compound actually contained that kind of matter, so when in a reaction a particular group of atoms was eliminated bodily from a compound, or introduced bodily into a compound, they concluded that this group existed as such in the compound. This conclusion, however, is not always so warrantable in the case of atomic groups as in the case of elements. The reaction, for example, by which an atomic group is eliminated from a compound involves the destruction of the parent compound, and in the process it is easy for the atomic groups to undergo rearrangement. The development of the idea of the molecule as distinct from that of the atom and the discovery of a means of determining the molecular weight of bodies, led to the division of isomerides into two classes—those in which the proportions of the various atoms were the same, but the number of atoms in the molecule was different, constituting cases of polymerism; and those in which both the proportions and the whole number of the atoms were the same, or isomeric bodies proper. The knowledge of the molecular weight aided in the construction of constitutional formulæ by determining the exact number of atoms in the molecule, and thus facilitating the task of arranging those atoms by stating precisely how many had to be arranged. The law of valency exercised an important influence by limiting the number of legitimate arrangements. The validity of a constitutional formula is attested by its correctly predicting reactions which

were not contemplated during its construction. It is not probable that there is anything like the constitutional formula—in the sense of its being a picture—in the molecule itself, but quite possibly there is something corresponding with it. A comparison of the physical properties of similarly-constituted compounds shows that in many cases very definite relations can be traced between constitution and physical properties. They are found in such features as the melting-point, boiling-point, specific gravity, behavior toward light, and molecular volumes at boiling-points.

Sir Henry E. Roscoe devoted his presidential address before the British Association at Manchester, chiefly to the general discussion of the present development and prospects of the science of chemistry. Dalton's theory of atoms had become established after fifty years of research, and that had been accomplished, at least to a certain extent, respecting it which he had declared impossible—the atoms had been measured. What are the exact relations between the atomic weights of the different elements—whether or not they are multiples of some ultimate unit—has still escaped painstaking investigation. But it appears to have been determined that “while the atomic weights are not exactly either multiples of the unit or of half the unit, many of the numbers expressing most accurately the weight of the atom, approximate so closely to a multiple of that of hydrogen, that we are constrained to admit that these approximations can not be a mere matter of chance, but that some reason must exist for them; what that reason is, and why a close approximation, and yet something short of absolute identity exists, is as yet hidden behind the veil.” Another set of relationships between the elements and their atomic weights has engaged Lothar Meyer, Mendelejeff, and Carnelly in the investigation from which they have agreed in placing all the elementary bodies in a regular sequence, and thus bringing to light a periodic recurrence of analogous chemical and physical properties. Under this system chemists have ventured to predict the atomic weights and qualities of undiscovered elements, and in several cases—gallium, scandium, and germanium—these predictions have been fulfilled. Such results, although they by no means furnish a proof of the supposition that the elements are derived from a common source, clearly point in this direction. Evidence regarding this inquiry is furnished by the action of heat, and consists in the fact that distinct chemical individuals capable of existing at low temperatures, are incapable of existence at high ones, but split up into new materials possessing a less complicated structure than the original. Not only compound bodies have been decomposed by this method, but Victor Meyer has proved in the case of iodine, that the molecule—which the author defines as a more or less complicated aggregation of atoms—is broken into

atoms, and J. J. Thomson has shown that this breaking up of the molecule can be effected by heat-vibrations, and by the electrical discharge at a comparatively low temperature. But none of our present atoms have been as yet split up. The spectrum has been thought at times to indicate something of the kind, but the phenomena so regarded may be more rationally referred to the presence of impurities or defect of observational power. So that neither the earth nor the stars have as yet given any evidence of a resolution of any element. Crookes has, however, added a remarkable contribution to the question of the possibility of decomposing the elements, in his observations of the peculiar and characteristic lines in the phosphorescent lights emitted by certain chemical compounds, especially the rare earths, under an electric discharge in a high vacuum; but the explanation of these phenomena does not necessitate atomic decomposition. Thermal chemistry is even yet in its infancy, but "an infant of sturdy growth, likely to do good in the world"; while great advance is promised in the region of electrical chemistry. By the theory of the constitution of matter by molecular arrangement, we are able not only to explain the differences in isomeric substances, but also to predict the number of distinct variations in which any given chemical compound can possibly exist. "This power of successful prediction constitutes a high-water mark of science, for it indicates that the theory upon which such a power is based is a true one." With this doctrine, associated with that of valency, organic chemistry has become synthetic, and Liebig and Wöhler's prediction fifty years ago, that sugar, morphia, and salicine would be artificially prepared, has been fulfilled. With the success achieved in this line of experimentation, "the belief in a special vital force has disappeared like an *ignis fatuus*, and no longer leads us in the wrong direction. We know now that the same laws regulate the formation of chemical compounds in both animate and inanimate Nature; and the chemist only asks for a knowledge of the constitution of any definite chemical compound found in the organic world, in order to be able to promise to prepare it artificially." Yet the barrier which exists between the organized and unorganized worlds is one which the chemist at present sees no chance of breaking down. "Protoplasm, with which the simplest manifestations of life are associated, is not a compound but a structure built up of compounds. The chemist may successfully synthesize any of its component molecules, but he has no more reason to look forward to the synthetic production of the structure than to imagine that the synthesis of gallic acid leads to the artificial production of gall-nuts." Liebig's classification of food-substances into those which serve for maintaining the heat of the body and those which are needed for repairing muscular waste, has not held good. The

nitrogenous constituents of food do doubtless go to repair the waste of muscle, while the function of the non-nitrogenous food is not only to supply the animal heat, but also to furnish, by its oxidation, the muscular energy of the body. We thus come to the conclusion that it is the potential energy of the food which furnishes the actual energy of the body, expressed in terms either of heat or of mechanical work; and to this must be added the action of the mind or the body not yet accounted for. Liebig's assumption that plants derive their carbon mainly from the atmosphere rather than from the ground, has been confirmed by the forty-four years' experiments of Lawes and Gilbert; but his theory that the whole of the nitrogen required by the plant is derived from atmospheric ammonia, is shown by the same experiments to be inadequate. Some light is given upon the origin of this nitrogen by Berthelot, who has shown that under certain conditions the soil has the power of absorbing the nitrogen of the air and forming compounds which can subsequently be assimilated by the plant. The microscope has contributed to our knowledge of fermentative processes by showing, in contradiction of Liebig's purely chemical view, that they are produced by the growth of new organisms; but chemistry steps in again at this point with the discovery that these organisms act by developing definite chemical compounds, the nature of which, and their function in provoking disease, it is for that science to determine.

Investigations of the spectra of various rare earths have led Mr. William Crookes to declare that there are elements, the existence of which is revealed by the spectrum lines, but which still remain to be separated. This view is confirmed by his own fractional separation of the earths of yttrium and by the parallel researches of Dr. Auer von Welsbach, M. de Boisbaudran, and M. Demarcay. Under these researches, yttrium indicated that it was composed of five constituents, and the two elements into which the didymium had been separated appeared each to consist of several. Other researches, by Drs. Krüss and Nilson, upon rare earths in Scandinavian minerals, have yielded still more interesting results, the main outcome of which appears to be that, instead of holmium, erbium, thulium, didymium, and samarium, we must, if we follow these authors, recognize the existence of at least twenty-two new elements. If we add to these the results previously obtained by Mr. Crookes with respect to yttrium, instead of six, we shall find ourselves in the presence of twenty-seven elements, and realize a gain of at least twenty-one such bodies.

Dr. T. Sterry Hunt proposes a new theory of the process of chemical union or combination, which he defines as integration. It may take place either among unlike or like species, and is in the latter case a homogeneous integration, constituting what is called polymeriza-

tion, while depolymerization is a homogeneous disintegration. These two forms of the chemical process are respectively metamorphosis by condensation and by expansion. As between unlike species they constitute heterogeneous integration and heterogeneous disintegration, or chemical metagenesis, and give rise to species differing in centesimal composition from the parents. The chemical species to those agencies which do not effect its disintegration, is a complete entity or integer. This, in the case of homogeneous integration of gases and vapors, is generated by the condensation into a single volume of two or more volumes of less condensed species; as where the atoms $H+H$ became the molecule H^2 . A number of substances are named which are double or dyad integers at normal temperatures, while others, tryad, tetrad, hexad, etc., at ordinary temperatures become dissociated by intense heating into equivalent numbers of dyads. As the specific gravity is known to vary with the equivalent weight in the case of gases and vapors, so a similar direct relation is indicated in liquids and in solids; and the hardness and chemical indifference of solid species are in like manner functions of their atomic weights. Further, the author advances that the gas or vapor of a volatile body constitutes a species distinct from the same body in its liquid or solid state, the chemical formula of the latter being some multiple of the first; and the liquid and solid species (probably always) constitute two distinct species of different atomic weights, whence it follows that all condensation of gases and vapors by cold or pressure, and all fusion, solidification, and vaporization, are chemical metamorphoses. This is in accordance with Henri Sainte-Claire Deville's views on dissociation. It is also in harmony with a suggestion by Prof. J. P. Cooke, that certain alloys are to be regarded in part as examples of a progressive series of isomorphous compounds of antimony and zinc of high equivalent, differing from each other nZn . This term is not to be considered a deviation from the law of definite proportions, but "only an expression of that law in a higher form."

Chemical Physics.—In his report on the subject of solution made to the meeting of the British Association, in 1885, Prof. W. A. Tilden particularly referred to the question whether the phenomena of that name are to be considered chemical or mechanical. At what point in the curve of the evolution of heat which takes place during the process of solution can we set up a distinction between the effect due to chemical combination and that due to other causes, such as the change of volume consequent on dilution, or the possible loss of energy from the adjustment of the motion of the molecules of the constituents to the conditions requisite for the formation of a homogeneous liquid, or the decomposition of the compound by the water? In the action of the solution of solids in water, the volume of the solution is

always, with the exception of some ammonium salts, less than the sum of the volumes of the solid and its solvent. Similarly, the addition of water to a solution is followed by contraction, which may be due to mechanical fitting of the molecules of the one liquid into the interspaces between those of the other; or to a readjustment of molecular motion. The heat evolved or absorbed during the admixture of any substance with water is a continuous function of the quantity of water added. Similarly, the contraction which ensues on diluting an aqueous solution proceeds continually, and the molecular volume of a salt in solutions of different strengths is continuously greater the larger the amount of salt present. So that no indication is observed of the formation of compounds of definite composition distinguishable by characteristic properties. As to the question whether the solvent and the substance dissolved in it, or any portion thereof, exist independently of one another the view seems preferable that save, perhaps, in excessively dilute solutions, the dissolved substance is attached in some way to the whole of the water. As to what determines the solubility of a substance, the following propositions seem to be true: Nearly all salts which contain water of crystallization are soluble in water, and for the most part easily soluble; insoluble salts are almost always destitute of water of crystallization, and rarely contain the elements of water. In a series of salts containing nearly allied metals, the solubility and capacity for uniting with water of crystallization generally diminish as the atomic weight increases. The fusibility of a substance has much to do with its solubility. Neither fusibility alone nor chemical constitution alone seems sufficient to determine whether a solid shall be soluble or not, but it may be taken as a rule that when there is a close connection in chemical constitution between a liquid and a solid, and the solid is at the same time easily fusible, it will also be easily soluble in that liquid. Salts containing water of crystallization may be considered as closely resembling water itself, and these are, for the most part, both easily fusible and easily soluble in water. No definite explanation of supersaturation has been generally accepted. In the opinion of the speaker it is identical with superfusion. The conclusion seems inevitable that chemical combination is not to be distinguished by any absolute criterion from mere physical or mechanical aggregation; and probably chemical combination differs from mechanical combination—called cohesion or adhesion—chiefly in the fact that the atoms or molecules of the bodies concerned come relatively closer together, and the consequent loss of energy is greater.

From experiments on more than forty elements, Mr. James Blake supposes that the action of inorganic substances upon living matter depends on their isomorphous relations, and that all substances belonging to one and the same isomorphous group give rise approximately to

the same physiological reactions. To this rule he has found only two exceptions—nitrogen and potassium. When the same element forms two classes of salts belonging to distinct isomorphous groups, the physiological action of the salts in each class is different, but agrees with that of other substances of the group to which it belongs. In substances of the same isomorphous group the physiological action increases in intensity with the atomic weights of the elements present. A specialization of the reactions for each isomorphous group is also observed. Thus the compounds of the alkali-metals act upon the internal ganglia of the heart; the compounds of phosphorous, arsenic, and antimony act upon the splanchnic ganglia; the substances of the magnesian group act upon the center for vomiting; and in an analogous manner for other groups, it is by modifying the action of some nerve-center that their physiological action is shown. Isomorphous substances are found to give rise to the same physiological reactions when they have homologous spectra, but when in an isomorphous group there are found elements whose spectra do not resemble the spectra of other elements of the group, these elements with anomalous spectra give rise also to anomalous physiological reactions. The exceptional character of the action of nitrogen and potassium is indicated by the exceptional character of their spectra, which are homologous with no other; and nitrogen, with a very complex spectrum, reveals its presence by its action on the nerve-centers, and is sharply distinguished from all the other elements of the same group.

M. Konovaloff, in treating of contact-action phenomena, has thrown out the suggestion that the bombardment of the molecules on the solid matter might cause a transformation in part of their kinetic energy into intra-molecular work, tending to bring about dissociation of the molecules. A. Irving has investigated that class of results which are observed when under the influence of heated spongy platinum, or platinized asbestos, or other porous or finely-divided bodies, combinations are brought about with the intervention of contact-action at much lower temperatures than are required without it. While we admit that the kinetic energy of a gas is proportional to its absolute temperature, and that the total resistance of a gas is the sum of the energies of motion of its constituent molecules, it does not follow that the energy of motion is the same in all the molecules. The temperature indicated by the thermometer must rather be regarded as the mean of the temperatures (or energies of translation) of the molecules. Further, the atoms themselves must be regarded as carriers of dynamical energy, and there must be variations in atom temperatures along with variations in the energy of translation of the molecules. "Dissociation temperature," so far as individual molecules are concerned, may be taken to represent simply a sufficient increase in the vibratory motions of the atoms

to carry them beyond the range of the attraction of affinity which holds them together in the molecule. Since both the energy of translation of the molecule and the atom-temperature may vary within wide limits, it follows that in a given mass of gas there must be some molecules which require a smaller accession of heat from without the system than is required by those which are in the condition of the mean dynamical intensity of the system, in order that they may be dissociated. This is what is known as the initial temperature of dissociation. If the mean temperature of the system be maintained constant above that of the initial temperature of dissociation, a certain percentage of the gas will be dissociated. For the same temperature, other things being equal, the same percentage of the gas is dissociated, but not the same identical molecules. New molecules are continually undergoing dissociation, while some of the previously dissociated atoms, owing to diminution in the intensity of their vibratory motion, enter again into molecular union, so that for complete dissociation either the removal from the system of the isolated atoms, or an enormous elevation of temperature of the whole system is required. When we have the intervention of a porous or finely-divided solid, the enormous increase of the solid surface must lead to a corresponding increase of the number of collisions in a given time between the individual molecules and that surface; and consequently internal work may be, and probably is, done among the atoms of the molecules by increasing the intensity of their vibratory action; and so far as the molecules thus affected are concerned, a smaller accession of heat derived from without the system would most likely be necessary to bring about initial dissociation.

Landholt has made some researches on the velocity of movement of the molecules of fluids and solids. He found that fluids which react immediately upon one another in certain degrees of concentration require more space for the process when dilute, in proportion to the degree of dilution. In his test experiment with a mixture of sulphurous and hydriodic acids resulting in the separation of iodine, other conditions being the same, the time in which the moment of reaction would take place could be foretold by the clock. A mixture of one molecular part of the sulphur acid to 20,000 molecular parts of water and two of the iodine acid to the same quantity of water, with starch added, remained colorless for twenty seconds, when the change to deep blue took place at once. When the dilution was doubled, two minutes, when tripled, seven minutes elapsed before the sign of the reaction was given. If, instead of water the dilution was effected with a liquid of greater viscosity—glycerin, for example, was employed as a diluent—the time required for the reaction was prolonged, and the exhibition of the effect, or the appearance of the blue color, was gradual.

J. N. Buchanan has experimented upon the composition of the ice produced in saline solutions, and more particularly in sea-water. It has been a question whether the salt found to be retained in the ice is to be attributed to the solid matter of the ice or to the liquid mechanically adhering to it. The experiments in freezing showed that the composition of the saline contents of the ice formed was the same as that of the original water, and this was of itself regarded as almost conclusive that the salt is contained in adhering brine, and not as a solid constituent of the ice. Assuming this to be so, the amount of ice formed as deduced from the composition of the mother-liquor, agreed well with the amount deduced from the thermal exchange taking place during the freezing. It has been proved by Guthrie, Rüdorff, and others, that in solutions of the salts occurring in sea-water, ice separates at first, and continues to separate until the concentration has become many times greater than that of sea-water. Assuming that in sea-water all the chlorine is united to sodium, 87 per cent. of the water would have to be removed as ice; and if it contained nothing but sulphate of soda in the proportion corresponding to the sulphuric acid formed in it, over 90 per cent. of the water would have to go as ice, before the cryohydrate would be formed. In Mr. Buchanan's experiments about 15 per cent. of the weight of the water was frozen out as ice, causing a lowering of the freezing-point by 0.8°C . In Nature the ice forming at the actual freezing surface probably does so at an almost uniform temperature. In the interstices of the crystals there will be retained a weight of slightly concentrated sea-water at least as great as that of the ice-crystals. At the winter quarters of the Vega, brine was observed oozing out of sea-water ice and liquid at a temperature of 80°C . It was very rich in calcium and especially magnesium chlorides. In fact, it is probably quite impossible by any cold occurring in nature to solidify sea-water. As residual and unfreezeable brine remains in considerable quantity when sea-water is frozen, it must also remain in greater or less quantity when fresh water is frozen. All natural waters, including rain-water, contain some foreign and in nearly all cases more or less saline ingredients.

Victor Meyer has found that magnesium melts at a temperature that can not fall far short of 800°C . As it is completely volatilized at a white heat the density of its vapor can not be determined. While the author was unsuccessful in his efforts to ascertain the densities of the vapors of antimony and germanium, he found that antimony could be completely, though slowly, volatilized at about $1,800^{\circ}\text{C}$.

Experiments by George Man, on the freezing of aerated water, gave the results that in a thin ice coating the upper or surface half contained barely a trace of eliminated air, while the under or bottom half contained 0.08 cubic inch of air in each pound of ice, and that a

surface coating of ice $1\frac{1}{2}$ inch thick contained 0.15 cubic inch of air in each pound, while an entirely frozen mass contained 0.59 cubic inch of air in each pound weight. The freezing of a limited body of water which had first been frozen over and had the surface ice removed, pointed still more strikingly to the concentration of air in solution, for this contained 0.89 cubic inch of air in each pound weight.

Olzewski has continued his experiments in the study of liquefied and solidified gases with very interesting results. Liquid hydrofluoric acid is frozen at -102.5°C . into a transparent crystalline mass, which at a lower temperature becomes white and opaque, and which melts at -92.3°C . The glass tubes used in the experiments were protected from the action of the acid by a thin transparent coating of paraffine. Gaseous phosphoretted hydrogen was easily liquefied at -90°C ., and frozen at -183.5° into a white crystalline mass, which melted again at 182.5°C . and boiled at -85°C . Antimoniureted hydrogen was likewise liquefied and condensed into a white snow, which melted at -91.5°C . into a colorless liquid. Ozone has been liquefied at the ordinary atmospheric pressure at a temperature of -181.4°C . The liquid in very thin layers at this temperature is transparent, but in layers 2mm. thick it is nearly opaque. Its point of incipient boiling was fixed at -109°C . with a thermometer containing carbon disulphide, which corresponds with -106°C . on a hydrogen thermometer. Sealed in a glass tube the liquid becomes a blue gas, which may be again condensed by placing it in boiling ethylene. The author has been able, with boiling ethylene and pressure, to obtain from 13 to 15cc. of any desired gas in the liquid condition. The volume, mass, and density of the liquid can be very readily determined with his apparatus. The densities of methane, oxygen, and nitrogen, thus found, are, at the temperature of their boiling-points:

PRODUCT.	Density.	Boiling-points.
Methane.....	0.415	-164.0°
Oxygen.....	1.194	-181.4
Nitrogen.....	0.835	-194.4

Experiments by Baker to determine the nature of the gas given up by charcoal on heating when it has absorbed oxygen, indicate that carbon monoxide is the chief product, and that the carbon is burned to this gas by the absorbed and firmly retained oxygen.

New Substances.—The new metal, germanium, is described by its discoverer, Clemens Winkler, as grayish white, having a brilliant metallic luster, and crystallizing in well-formed, regular octahedrons. It melts at a somewhat lower temperature than silver, 900°C ., and volatilizes at a slightly higher one than this, expands on solidifying, and crystallizes. Before the blowpipe it fuses to a globule, which evolves white fumes and explodes, as does antimony. Its atomic weight is calculated at 72.320. Le-

coq de Biochaud estimated its atomic weight from two characteristic lines in the spectrum at 72.31 or 72.27. The position of germanium is that of ekasilicon in Mendelejeff's table, for which he predicted an atomic weight of 72 and specific gravity of 5.5. The specific gravity of germanium is 5.469. This position is more conclusively indicated by two of the compounds of germanium prepared by Dr. Winkler. The first is germanium-chloroform, GeHCl_3 , analogous to the similar compounds of carbon and silicon, which is obtained by gently heating germanium in a stream of dry hydrochloric-acid gas. The second is germanium ethide, $\text{Ge}(\text{C}_2\text{H}_5)_4$, analogous to the ethides of silicon and tin, which is obtained by the action of two volumes of zinc ethide upon one volume of germanium tetrachloride. This disposes of all doubt that the gap in the periodic table must be occupied by germanium, for Dr. Mendelejeff predicted that the metal thus filling up this particular gap would be found to form, if discovered, a tetræthide of specific gravity about 0.96, and boiling at 180° —conditions which germanium ethide fulfills.

A fine series of new coloring-matters has been discovered by Dr. J. H. Siegler, by the employment of the hydrazine reaction upon amido-derivatives of triphenyl-methane. Rosaniline hydrochloride was first converted by nitrous acid into its diazo-derivative, and this was then reduced with tin and hydrochloric acid, yielding brilliant green crystals of a hydrazine salt. This new hydrazine, which the discoverer terms roshydrazine, is itself a coloring-matter of a somewhat bluer shade than fuchsine, and forms the nucleus of the series. By treatment with aldehyde, acetone, or benzophenone, condensation products are obtained possessing brilliant colors, varying from red to violet; benzaldehyde and aceto-acetic ether, yield beautiful blues; while grape-sugar forms with roshydrazine a dye of a greenish-blue tint. Numerous shades are further produced by the action of other reagents. The sulpho-derivative of roshydrazine appears to form a second series of colored substances quite as numerous as those of the nucleus itself. These new colors are practically insoluble in water, and a fact of most vital importance about them is that they may be readily prepared *in situ* upon the fiber; for it is only necessary to immerse the material first in a bath of roshydrazine, and afterward in a second bath containing the condensing reagent.

Mr. Cary Lea has published a series of papers to show that chlorine, bromine, and iodine are capable of forming compounds with silver exhibiting varied and beautiful colors—peach-blossom, rose, purple, and black; that these compounds (except under the influence of light) possess great stability; that they may be obtained by purely chemical means, and in the entire absence of light; that of them the red chloride shows a tendency to the reproduction of colors. It is not improbable that the

material of the infinitesimally thin films obtained by Becquerel, Niepce de St. Victor, Poitevin, and others, may be the red chloride; and that these substances, formed by purely chemical means, constitute the actual material of the latent invisible photographic image, which material may now be obtained in the laboratory without the aid of light and in any desired quantity. They also form part of the visible product resulting from the action of light on the silver haloids. The salts thus produced are called by the author photo-salts, because of their identity with the products of the action of light on the normal silver haloids. Mr. Lea concludes from the results of his experiments, that the latent photographic image consists neither of the normal silver haloid modified nor of a subsalt, but of a combination of normal salt and subsalt; that the salt loses in this way its weak resistance to reagents, and acquires stability, thus corresponding to the great stability of the latent image, which, though a reduction product, shows considerable resistance to even so powerful an oxidizer as nitric acid; further, that this combination of normal salt and subsalt, which constitutes the material of the latent image, can be obtained by chemical means, and wholly without the aid of light; that the forms of the photo-salts which correspond to the material of the latent image are colorless or nearly so, but that other forms, possessing beautiful and often intense coloration, also exist. With the chloride some of these brightly-colored forms show a ready tendency to reproduce color, in some cases with well-marked and beautiful tints. "So that we have here an approach to the solution of the problem of obtaining images of objects in their natural colors from a quite new direction, and probably with better hopes of an eventual complete success than by any of the older methods."

A new preparation, salol, or phenolsalicylic acid, offered by Professor Rencki as a substitute for the unpleasant specific salicylate of soda in rheumatic disorders, has found a ready market. The new compound is as valuable as an antiseptic and antipyretic as in its more special application. It is a white, crystalline powder, having a weak aromatic odor, but perfectly tasteless, insoluble in water, but easily soluble in alcohol and ether. The pure preparation melts at 42° or 43°C. , and is not colored by chloride of iron, which stains its components, phenol or carbolic acid, and salicylic acid—deep bluish green or violet. It is prepared by heating molecular proportions of salicylate of soda and phenol-soda with chloride of phosphorus. Salol is perfectly harmless in its effects on the system, and is used in the same way as the salicylate of soda.

The theory that microbes are the primary sources of disease has been qualified by the discovery that certain alkaloids which act as violent poisons are the immediate result or accompaniment of bacterial fermentation. Brie-

ger has isolated a well-characterized alkaloid, which he calls tetanine, from the liquid used for cultivating a bacillus which has been supposed to cause tetanus traumaticus in animals. His experiments raise the question whether the bacillus or the tetanine is the immediate cause of the disorder. It remains to be determined whether the alkaloid is a secretion or other product of the life of the bacillus, when the bacillus would be the primary cause and the tetanine the secondary or immediate cause of disease; or, whether it is a direct result of chemical action in the cultivating liquid.

About 300 cases of cheese-poisoning having occurred in Michigan in 1883-'84, all traceable to the eating of twelve different cheeses, Victor C. Vaughn examined specimens of all the cheeses, in order to detect the toxic agent. The cheeses were in good condition, with nothing in the taste or odor to excite suspicion; but from a freshly-cut surface there exuded numerous drops of a slightly opalescent fluid, which reddened litmus instantly and intensely. It was also observed that when samples of this cheese and of a good cheese were placed before a cat or a dog, the animal would invariably select the good cheese; while it would eat the poisonous cheese if no other were offered. From an alcoholic extract of the cheese a residue was collected which produced the symptoms of poisoning, but from which the poison itself could not be separated. The aqueous extract was also poisonous, but when evaporated at the boiling-point of water, carried off the poison with the vapor, proving the poison to be volatile. Distillation at a low temperature likewise seemed to cause a decomposition of the poison. It was, however, separated by spontaneous evaporation in needle-shaped crystals, having a penetrating, old-cheesy odor, like that which Hussemann and Boehm have observed in poisonous sausage. If the crystals are allowed to stand exposed to the air at ordinary temperature, they decompose with the formation of an organic acid. The substance, which is called tyrotoxin, is soluble in water, alcohol, chloroform, and ether. The smallness of the amounts obtained and the rapid decomposition have prevented definite analysis. The only certain test for the poisons is the physiological one. A few drops of an aqueous solution of the crystals placed upon the tongue produce the symptoms characteristic of poisonous cheese: dryness of the throat, nausea, vomiting, and diarrhea. The same poison recognized by its crystalline appearance and its physiological effects, was isolated from milk which had stood in a glass-stoppered bottle for about six months. Normal milk placed in perfectly clean bottles secured with glass-stoppers, developed the poison in about three months. In the case of the poisoning of a number of persons by ice-cream, the effect was traced to tyrotoxin; and in this instance the poison was found to have been formed after exposure, under favorable bac-

teriological conditions, for only a few hours. It is known that milk, while undergoing the lactic-acid fermentation, does not possess any such poisonous properties as belong to tyrotoxin; and there is no evidence that the poison is connected with the ordinary decomposition of milk. It is probably the product of a peculiar bacterial fermentation.

A new amorphous modification of arsenic has been obtained by Geuther, by slowly adding cold water to a mixture of arsenic trichloride and phosphorus trichloride, and heating the whole to boiling. It is brownish black in color, and has a specific gravity of 8.70; ordinary amorphous arsenic is black, and has a specific gravity of 4.71.

Mr. Fletcher has obtained a third crystalline form of carbon by treating an Australian meteoric iron with *agua regia*. Bright opaque grayish-black crystals remained, having a metallic luster, and presenting forms belonging to the cubic system. The hardness is considerably greater than that of graphite, which the crystals otherwise resemble in density, color, and streak, but their sharply-defined cubic forms are quite different from the indistinct tabular crystals of graphite.

W. F. Hillebrand has described a new mineral from Tombstone, Arizona, which is called Emmonsite. It is yellowish green, translucent, and occurs in crystalline scales and patches in a brownish gangue, composed of lead-carbonate, quartz, and a brown substance containing iron, tellurium, and water. It is probably monoclinic, and slightly pleochroic. Its specific gravity is about 5. In composition it is a hydrated telluride of iron, usually containing a trace of selenium.

A new chlorobromide of silicon—chlorotribromide, SiClBr_3 —has been isolated by Prof. Emerson Reynolds from crude silicon tetrabromide. It is a liquid which fumes in the air, and on addition of water is decomposed into a mixture of silicic, hydrobromic, and hydrochloric acids. It is of considerable theoretical interest, inasmuch as it completes a series of compounds in which chlorine and bromine mutually replace each other, and the end-members of which are formed by the tetrachloride and tetrabromide of silicon, respectively, as follow: SiCl_4 , SiCl_3Br , SiCl_2Br_2 , SiClBr_3 , and SiBr_4 . This series is now perfectly analogous to the one formed by the compounds of chlorine and bromine with carbon.

Gottig has described two new hydrates of potassium hydroxide, which were obtained from alcoholic solutions having different specific gravities. The hydrate from the stronger solution forms large prismatic crystals, and gives the formula $(\text{KOH})_2 \cdot (\text{H}_2\text{O})_2$. The other hydrate, $(\text{KOH})_2 \cdot (\text{H}_2\text{O})_3$, forms exceedingly long needles which split in drying into fine filaments, causing the mass to resemble cotton-wool; and on complete drying these unite again to form a hard, compact mass.

New Processes.—Mr. Castner's new process for

the production of metallic sodium and potassium, which has been mentioned in previous volumes of the "Annual Cyclopædia," has proved to be practicable and successful. A more detailed description of the process than we have hitherto given is the following: "The mineral known as 'purple ore,' an oxide of iron, is heated to a temperature of 500° C., and at the same time a mixture of carbonic oxide and hydrogen is poured over it. By this the oxide of iron is changed into metallic iron, which remains in the state of a fine powder. This powder is mixed with melted pitch, and the whole is allowed to cool. It is next broken into lumps of about the size of bricks, and these are heated in large crucibles, and converted into coke. This coke is found to contain a definite quantity of iron and carbon, which can not be separated again by mechanical means. It is next powdered finely, and added in proper proportions to the hydrate of potash or soda, and the mixture is gently heated for about thirty minutes in a retort of cast-steel or cast-iron, whereby it is fused and made to give off large quantities of hydrogen gas. When the bulk of this gas has disappeared, the reaction proceeds with less violence; and the retort is then placed in a hotter furnace where the temperature rises to about 800° C. The sodium or potassium distills over very quickly, and in about ninety minutes the operation is complete. Great care is taken that no carbonic-acid gas should be produced during the distillation of the metal, because this gas is the cause of the formation of the explosive compound. This is practically possible without adopting any other precaution than that of using a quantity of the coke slightly less than the theoretical amount."

O. A. Crampton and T. O. Trescott describe a process for the estimation of carbonic acid in beer. The analysis is difficult in the case of beer in casks or kegs, on account of the impossibility of preventing the loss of carbonic acid in drawing the beer, but is easier with bottled beer. A champagne tap is used for drawing the gas. A difficulty arising from the stoppage of the tube by the accumulation of bubbles was obviated by connecting the champagne tap with an Erlenmeyer flask, in the broad bottom of which the bubbles are broken. This is connected with a U-tube filled with sulphuric acid, and this with a calcium-chloride tube and then a soda-lime tube to absorb the dried carbonic acid. The drawing of the gas through the tap is assisted by heating it to 80° C. after it has ceased to flow spontaneously. The gas is collected and absorbed in the soda-lime tube; and the increase in weight of the latter after the experiment gives the amount of carbonic acid in the beer.

H. B. Cornwall, analyzing butter for the detection of artificial coloring-matters, extracts annatto by the ethereal process. The dry, yellow, or slightly-orange residue of this substance turns blue or violet-blue with sulphuric

acid, then quickly green, and finally brownish, or to a violet variable according to the purity of the extract. Saffron, which can be extracted in the same way, differs from annatto very decidedly; the most important difference is in the absence of the green coloration. Genuine butter, free from foreign coloring-matter, imparts at most a very pale-yellow color to the alkaline solution; but it is important to note that a mere green coloration of the dry residue on the addition of sulphuric acid is not a certain indication of annatto; for the author has obtained from genuine butter, free from foreign coloring-matter, a dirty-green coloration, but not preceded by any blue or violet-blue tint. Turmeric is easily identified by the brownish to reddish stratum that forms between the ethereal fat solution and the alkaline solution before they are intimately mixed. It may be better recognized by carefully bringing a very slightly alkaline solution of ammonia in alcohol beneath the fat solution, and then gently agitating the two for a moment.

The brothers O. and A. Brice, of Paris, obtain oxygen in quantities for economical use by utilizing the property of barium oxide, BaO, of absorbing oxygen from the atmosphere at a moderate heat, whereby the superoxide, BaO₂, is formed, and giving it out again when heated to a higher temperature. During the oxidating process the nitrogen is pumped into a second system of retorts containing a baryta coke, formed by mixing caustic baryta and charcoal-dust with tar, whereby a cyanide of barium is formed, and then converted by treatment with steam at 300° C. into ammonia, carbonic acid, and regenerated baryta. Baryta is obtained for this purpose by treatment of the nitrate by a patented process.

H. Moissan has isolated fluorine by exposing anhydrous hydrofluoric acid to a strong electric current, using platinum for the negative, and a mixture of nine parts of platinum and one part of iridium for the positive electrode, and reinforcing the hydrofluoric acid at a certain moment with hydrofluorate of potash. Hydrogen appeared at the negative electrode, and at the positive, fluorine, as a colorless, strongly-smelling gas. In it, silicon burned with a bright glow, producing fluosilicic acid, as did also, likewise with light, and producing their respective fluorine compounds, boron, phosphorus, arsenic, antimony, sulphur, and iodine. Water was decomposed with the formation of hydrofluoric acid and ozone; iodine was separated from potassium iodide. The gas acted less vigorously upon the metals, probably because the resultant coating of fluoride protected the rest of the metallic substance; and was inert as to carbon. Many organic substances were strongly attacked, and some, including alcohol, ether, benzene, petroleum, and turpentine oil, with ignition. After some time, the fluorine and hydrogen again came in contact, when they were reunited, with detonation.

MM. Colson and Gauthier describe a new

quantitative reaction, by means of which any desired substitution of chlorine may be readily effected in a large number of hydrocarbons. It consists of heating in a sealed tube the calculated quantities of hydrocarbon and phosphorus pentachloride, when the pentachloride is dissociated into the trichloride and free chlorine. The value of this means of substitution lies in the fact that, instead of the uncertain results so frequently obtained by the graduated use of free chlorine, it now becomes possible to obtain a quantitative yield, in a form that is easily separable, of the particular chlorine derivative desired.

R. T. Thomson publishes two methods for the estimation of aluminum in the presence of a large proportion of iron. One is for use when but little, the other when a larger proportion of manganese is present. Both depend upon the reduction of the iron to a ferrous state and the precipitation of aluminum as a phosphate by means of ammonia and ammonium acetate.

Franke describes the preparation of manganic anhydride, MnO_2 . To obtain it, dry potassium permanganate is added to well-cooled sulphuric acid; the green solution formed is either heated to $50^\circ C.$, after addition of a little water, or better, allowed to flow, drop by drop, on to calcined soda. Violet vapors of manganic anhydride are evolved, and condense in the receiver to a dark amorphous mass. When heated at 50° it volatilizes in violet vapors, with partial decomposition into manganic dioxide and oxygen. If heated more strongly, it is completely decomposed into those substances. It dissolves only sparingly in water, imparting to it a deep-red color. It is also a most vigorous oxydizing agent.

Industrial Chemistry.—Mr. A. E. Fletcher, chief inspector under the Alkali Works Regulation Act, describing in the British Association the present position of the alkali manufacture, said that Leblanc's process had withstood the attacks of all rivals, and that, although the competition against it was fiercer than at any previous period, he thought that it would maintain its position for many a year to come. During the last ten years slight alterations had been proposed in the proportions to be used of the three ingredients forming the charge of the black-ash furnace—the coal, brimstone or chalk, and sulphate of soda—and in the method of throwing them in the furnace. The main process, however, of fusing these materials together, and, when cold, lixiviating the mixture for the extraction of carbonate of soda, is followed almost exactly as was proposed by Leblanc, now almost a century ago. It must be acknowledged that this process is seriously attacked by another, so far as the manufacture of carbonate of soda is concerned, and it would have been by this time completely driven out of the market by its rival, but for the importance of its by-product. Bleaching-powder had not as yet been made in connection with the ammonia process. Three methods were, how-

ever, proposed, and were on their trial for the attainment of that end. If bleaching-powder could be produced by either of them at a moderate cost, the older alkali process could no longer stand its ground.

Traube has made some new researches on the part taken by water in the combustion of carbonic oxide, which have a double interest in their bearing on the properties of water-gas, and of the peroxide of hydrogen. The peroxide of hydrogen is constantly finding increasing application, more or less diluted with water, as an oxidizing, bleaching, and disinfecting agent. It is used for the bleaching of bones and ivory, wool, silk, feathers, and hair; in housekeeping for removing wine and fruit spots from white cloths. It stops all kinds of fermentation, and is therefore a good preserving agent. Destroying all micro-organisms, it is valuable in the treatment of wounds and skin-diseases. To prevent decomposition, however, the solutions of this substance must be kept at a low temperature and protected from the light. According to Dixon's experiments, a perfectly dry mixture of oxygen and carbonic oxide can not be exploded by any ordinary means; and ignition will not take place until a certain quantity of the vapor of water is introduced. Traube has confirmed these important observations, and has found, further, that carbonic oxide already inflamed is immediately extinguished in a perfectly dry atmosphere. He found, further, that carbonic oxide, even at a high temperature, will not decompose water, so that no trace of carbonic acid or hydrogen is developed under those conditions. But hydrogen has a reducing action on carbonic acid at a red heat; and if we pass an electric spark through a mixture of the two substances, carbonic oxide and water are formed. Traube, therefore, concluded that water plays a similar part in the combustion of carbonic oxide at a red heat to that which it plays, according to his researches, in the slow combustion of the baser metals; that is, that in both cases it is decomposed with the formation of peroxide of hydrogen. Carbonic oxide, which alone can not decompose water, exerts this action with the aid of oxygen. In fact, direct experiments show that the flame of carbonic oxide when brought in contact with water gives off so much peroxide of hydrogen that very intense reactions are produced with potash permanganate or zinc iodide, and sulphate of iron, or with chromic acid and ether.

Cholesterin is a fat which occurs in the feathers of birds and other animal coverings, and is present in considerable proportions in wool. Because of its uncleanness and unpleasant smell, and of its containing 25 per cent. of free fatty acid, it has to be removed in the preparation of the fabric; while hitherto it has been regarded as of no value except as a combustible or as the raw material for illuminating gas. The clear fat arising from the combination of cholesterin with the fatty acids has

been found, however, to possess some valuable properties. It is perfectly neutral, and not saponifiable with alkaline hydrates, while it is capable of taking up an equal weight of water, and forming an extremely pliant soft mass absorbable by the skin, which can be incorporated with various medicaments. Liebrich has closely studied this substance, which he calls "Lanolin," and having been manufactured commercially and introduced to the trade, it has in a short time come into quite general demand as a basis for salves and cosmetics.

Mr. C. O'Neill, in a British Association paper on "the extent to which calico-printing and the tinctorial arts have been affected by the introduction of modern colors," after remarking upon the continuing multiplication of the modern colors, said that none of them, except alizarine and its allied blue and orange derivatives, could be said to be fast colors upon cotton in the sense that madder and indigo are fast. At the same time many of them were fast enough for the purposes to which they were applied, and had contributed in calico-printing to give a variety of coloring which had no doubt extended the demand for printed goods. The idea that all new dyes were bad dyes was not warrantable. Whatever might be the true state of the case with regard to cotton fabrics, the author considered that the introduction of modern colors in the dyeing of fancy silk and woolen styles had proved of very great advantage.

The search for means for improving artificial lights of all kinds has led to the utilization of rare earths which, like lime and magnesia, have great light-emitting properties combined with permanent powers of resistance. Zirconia thus figures as the wick in Linneman's oxygenated gas-lamp, and in Auer's new incandescent gas-light, a combination of similar rare earths is said to be employed.

Dr. C. Fahlberg, of Johns Hopkins University, read a paper in the British Association on "Saccharine, the New Sweet Product from Coal-tar." The new extract, which was two hundred and fifty times sweeter than sugar, had become an article of commerce, and was manufactured in Germany. Experiments upon animals and men, and nine years' use by the author, had proved it to be entirely harmless.

Charles L. Bloxam describes the following as a characteristic and delicate test for indentifying strychnine: the alkaloid, on a glass slide or a porcelain crucible lid, is dissolved in a drop of dilute nitric acid, and gently heated; to the warm solution a very minute quantity of powdered potassium chlorate is added, which will produce an intense scarlet color; one or two drops of ammonia will change this to a brownish color, giving a brownish precipitate. The mixture is then evaporated to dryness, when it leaves a dark-green residue, dissolved by a drop of water into a green solution, changed to orange brown by potash, and becomes green again with nitric acid. These last

changes of color may be repeated any number of times. None other of the commonly-colored alkaloids which were tried could be mistaken for strychnine by this test, but each of them exhibits some peculiarity when treated in the same way, which would give a clew to its identity. A convenient reagent for the detection of alkaloids can be made by mixing a weak solution of potassium chlorate with enough strong hydrochloric acid to turn it bright yellow, and enough water to make it very pale yellow. This *euchlorine* solution is added by degrees to the solution of the alkaloid in HCl, which is boiled after each addition. Strychnine gives a fine red color, bleached by excess and returning when boiled. Brucine gives a violet color in the cold, which is bleached by excess and restored by boiling. Narcotine gives a bright-yellow color in the cold, which becomes pink on boiling and adding more of the *euchlorine* solution. Quinine gives a faint yellowish pink on boiling. After cooling the solution weak ammonia is gradually added, when: Strychnine gives a yellow color unchanged by boiling. Brucine gives the same. Narcotine gives a dingy green, becoming brown on boiling. Quinine gives a bright green, becoming yellow on boiling. Morphine gives no reaction, but if, after boiling with the *euchlorine* solution, the liquid be cooled and allowed to remain in contact with zinc for a minute or two, it will give the characteristic pink reaction with ammonia.

William Crookes, observing the phosphorescence of alumina and its various forms under the influence of the electrical discharge *in vacuo*, has remarked the full red color which it presents. The spectrum of the glowing earth is marked by an intensely brilliant and sharp line, to which the color is due. Observations by M. de Boisbaudran led him to suppose that the presence of chromium is indispensable to the production of this color. Mr. Crookes having, in experiments directed expressly to this point, produced the red color with alumina freed from chromium, suggests four other possible explanations of the phenomenon: 1. The crimson line is due to alumina, but is capable of being suppressed by an accompanying earth which concentrates toward one end of the fractionations. 2. It is not due to alumina, but is due to an accompanying earth concentrating toward the other end of the fractionations. 3. It belongs to alumina, but its full development demands certain precautions to be observed in the time and intensity of ignition, degree of exhaustion, or its absolute freedom from alkaline and other bodies carried down by precipitated alumina; or, 4. The earth alumina is a compound molecule, one of the constituent molecules of which gives the crimson line. According to this hypothesis, alumina would be analogous to yttria.

Among the questions to which the Committee on Electrolysis of the British Association gave attention during the year, was whether the well-marked metallic alloy or *quasi-com-*

pound could be in the slightest degree electrolyzed by an exceedingly intense current. Until all such bodies as were open to experiment had been cautiously and strenuously examined, they were unable to say whether there was a hard and fast line between the modes of conduction, or in what manner the graduation from one to the other occurred. Another important question was whether the electric current actually decomposed or tore asunder the molecules of the liquid through which it passed, or whether it found a certain number of those torn asunder or dissociated into their atoms by chemical, or at any rate, non-electrical, means, and that these loose and wandering atoms submitted to the guiding tendency of the electric slope, and joined one or the other of two processes toward either electrode, only offering resistance when brought into immediate proximity with the electrode.

Dr. Hans Molisch proposes as more delicate and speedy tests than have hitherto been used for distinguishing between animal and vegetable fibers, two new sugar reactions which he has discovered and described in full in the "Transactions of the Imperial Academy of Sciences in Vienna." They are, the production by all sugars with alpha naphthol of a deep-violet coloration, and with thymol of a cinnabar-ruby-carmine-red, flocculent precipitate. The same reactions are given indirectly by the carbohydrates and glucosides, from which sugar is formed after treatment with sulphuric acid. Plant-fibers contain sugar or the substances convertible into sugar, and give the sugar-tests; animal fibers do not. A few silks give a weak, transient reaction, but it is so slight and continues for so short a time that it need not deceive the careful observer. It is important, however, in applying the test, to remove all foreign vegetable matter that may be accidentally present, or left in the finishing. This may be done by boiling and washing.

Lecoq de Boisbaudran having asserted, contradictory to Becquerel's conclusions, that calcined alumina does not give a trace of fluorescence when submitted to the electric discharge *in vacuo*, and that the red fluorescence of alumina seems to depend upon the presence of chromium, Becquerel has repeated his experiments, using for the purpose substances furnished by De Boisbaudran himself, and finds his previous conclusions confirmed. The fragments of alumina, when excited by the light of the electric arc, emitted a red light, which, however, was much weaker than that given out, under the same circumstances, by alumina containing chromium. But, after calcination, this alumina became quite as luminous as alumina containing chromium, and of the same color. With alumina prepared by himself, the light emitted was the characteristic red light. The addition of chromium, then, does not change the color of the phosphorescent light, but simply increases its intensity. Becquerel calls attention to the difference in the luminous phe-

nomena according as they are produced by the electric light in the phosphroscope or by the electric discharge *in vacuo*; the former effects being simple, but not obtainable with all bodies. Crookes has also examined this subject, with a view of clearing up the discrepancies between the two observers. His results generally corroborate Becquerel's observations.

A. Percy Smith says, in a note on "The Identification of Alkaloids and other Crystalline Bodies by the Aid of the Microscope," that the number of cases in which such substances can be identified by this instrument alone is extremely limited; but, as a test of purity, microscopic investigation has a very wide application. When we are dealing with a substance that, when pure, crystallizes in a definite form from any particular solvent, it is manifest that any departure from that form would lead to the suspicion of adulteration. Again, if we take such a substance as bark or opium, it is quite possible to distinguish from one another the various alkaloids which it contains. Besides the form assumed by the free base, it is of importance to convert it into a salt, as there is frequently a marked departure in the form of the crystals of the latter from that of the base. Some experience is necessary in selecting the most suitable solvent from which to crystallize an alkaloid, as the duration of the evaporation may have a marked effect upon the form of the crystals. In some cases, evaporation may be accelerated by the aid of heat; in others, such a proceeding is fatal to success. The addition of alcohol to ether, and of water to alcohol, appears to be the best means of retarding the process when necessary. The author always employs polarized light by which to view the crystals, either with or without the addition of a selenite plate. Here, again, the duration of evaporation has a marked effect, as also does the strength of the solution. If the substance is deposited in a thin film, it may be altogether invisible without polarized light. Thick crystals frequently produce color without the selenite, and those that are very thick may depolarize without any coloration. This being borne in mind, no difficulty whatever is experienced in practice, as it is easy to compare with an alkaloid of known purity crystallized under the same conditions.

J. Edward Whitfield has reported upon the analysis of natural borates, in which, instead of the inaccurate methods hitherto in use, boric acid has been determined by a method devised by Dr. F. A. Gorch. The minerals analyzed are Colemanite, from California; Priceite, from Oregon; Ulexite, from Nevada; Ludwigite, from the Banate, Hungary; Datolite, from Bergen Hill, N. J.; Danburite, from New York; and Axinite, from Cornwall and from Dauphiny, France.

Atomic Weights.—Prof. Thorpe and Mr. A. P. Laurie have redetermined the atomic weight of gold from a preparation of the double bromide of potassium and gold. Taking Stas's

value for oxygen at 15.96, the atomic weight of gold is fixed by the average result of their analyses at 196.85; but if, with Mendelejeff, we consider oxygen 16, the atomic weight of gold becomes 197.28. Mendelejeff considered the old value of gold, 196.2, to be too low, because there was no place in the periodic system for an element of that atomic weight having the properties of gold. Hence the result of the present determination has been to place gold in what seems to be its proper position in the periodic classification.

Gerhard Krüss has determined the atomic weight of gold by the analysis of neutral trichloride and of potassium gold bromide. The mean value derived from five methods was 196.669. The author regards 196.64 as most probably correct.

A. C. Cousins has observed, in studying the relations between gold, thallium, and mercury, that the atomic weight of mercury is the mean of those of gold and thallium; that its specific gravity in the liquid state is very nearly the mean of their atomic volumes; and that its own atomic volume is almost exactly the theoretical specific gravity of an alloy formed of equal weights of gold and thallium.

Prof. Carnelly, in a paper in the British Association on "The Antiseptic Properties of Metallic Salts in relation to their Chemical Composition," held that there was a relation between the atomic weights of various substances and their antiseptic properties, and suggested that there was a distinct relation between the power which these antiseptic bodies had upon animals and those which they produced upon micro-organisms.

Prof. Thorpe and Mr. J. W. Young have determined the atomic weight of silicon, from the tetra-bromide, which they prepared in considerable quantity, at 28.332.

Apparatus.—J. B. Mackintosh has devised an improved form of Elliott's gas-apparatus to obviate difficulties in the ordinary form of that apparatus, and prevent the liability of accidentally introducing some air during the operation. The essential feature of the apparatus is a three-way T-stopcock on the measuring burette, by which connection may be made between any two of the burettes to the complete isolation of the other. Another time-saving device is in the fixing of the zero-points of the graduations. In the measuring and explosion burettes the zero-point is taken at that point where the capillary-tube expands into the burette, and where the water will naturally remain when the excess drains to the bottom of the burette. This renders the adjustment to zero an automatic one, with no sacrifice of accuracy. The absorption-tube has a single graduation at 100cc.

A new form of spectroscope has been devised by G. Krüss, which is based upon the Bunsen and Kirchhoff instrument, but has received a number of modifications and additions adapted to make it available as a universal spectroscope.

With it, spectrum measurements may be made between two colors whose wave-lengths differ by only 0.000,000,000,015mm. The inventor thinks that the results obtained by this instrument when used as a spectro-photometer, are fully equal, if not superior, to those obtainable with polarizing instruments.

Charles W. Folkard has described a simple apparatus, made from ordinary laboratory appliances, for the bacteriological examination of water. Test-tubes, about 7 inches long and seven-eighths of an inch in diameter, are used to receive the nutrient jelly. They are closed by a plug of cotton-wool, which is tied by thread round a piece of glass tube bent at right angles and drawn off at one end. The bent tube has a capacity of 1cc., and serves for the introduction of the measured quantity of water for experiment. The whole is sterilized in the usual way. The water, of which a sample is to be examined, is allowed to run through a piece of three-eighths-inch India-rubber tube (pierced with a small hole in the middle, and furnished with a glass jet at the end) till all the germs on the tube have been washed away. The capillary end is passed through the hole in the India-rubber tube, and sufficient time is allowed for any germs on it to be washed off. The capillary end is then broken off by the fingers or by a pair of pliers, while it is inside the India-rubber tube. The water (which is of course running all the time) fills the bent tube, being assisted, if necessary, by partially stopping the glass jet for an instant. The bent tube is then withdrawn, the capillary end is sealed in the flame, and the 1cc. of water is transferred to the test-tube by shaking.

Schall has constructed a balance on which the ratio of the density of any given gas to that of hydrogen—and hence the molecular weight of this gas—may be read directly from the deflection.

Agricultural Chemistry.—Sir J. Lawes and Dr. Gilbert, reporting in the British Association on "The Present State of the Question of the Sources of Nitrogen in Vegetation," quoted the opinions of a number of writers on the cultivation of the soil, and said that the results at present are extremely conflicting as to whether free nitrogen comes into play in any way. The results quantitatively are most discrepant, and the explanations are almost as numerous as the observers; still there are many results which can only be explained in one of two ways: either error was at work or free nitrogen was brought into operation. The authors thought, however, that they must hold their opinions in abeyance for the present. They dwelt upon the experiments which had been made in the raising of various crops, and said it was shown that nitrogen was derived from the residue of crops previously taken from the soil. There was clear evidence of nitrification of the subsoil in certain cases. The evidence was at present inadequate to justify a definite conclusion upon the matter.

Warrington's experiments at Rothamstead, before referred to in the "Annual Cyclopædia," indicated that in "our clay soils the nitrifying organism is not uniformly distributed much below nine inches from the surface." In later experiments, in which rather more soil was placed in the solution to be nitrified, and a proportion of gypsum was added, the results were in many respects entirely different. No failure to produce nitrification was observed in samples of soil down to and including a depth of two feet from the surface; and in some instances nitrification took place at as great depths as four and six feet, but at seven and eight feet all the experiments failed.

Miscellaneous.—John Trowbridge and C. C. Hutchins have made new spectroscopic examinations to determine the question of the existence of oxygen in the sun's atmosphere, which is still a matter of doubt. Dr. Henry Draper was firmly persuaded from the apparent coincidences of lines of oxygen with certain bright spaces in his photographs of the sun's spectrum, that oxygen existed in the solar atmosphere; and his investigation was accepted by M. Faye. Prof. J. C. Draper also reasoned that oxygen existed in the sun from the coincidences of bright oxygen lines with dark oxygen lines in the spectrum. With the use of spectroscopes of much wider dispersion power than were at the command of these observers, and therefore giving more numerous and accurate data, the authors found that the "bright lines" of the sun's spectrum vanished at once, or no longer appeared as such, and all the apparent connections between them and the oxygen lines also disappeared. The hypothesis of Prof. J. C. Draper, that the dark lines occupying the bright bands of Dr. H. Draper's spectrum is rendered untenable by the lack of any systematic connection between the two.

Dr. Edward Schunk, President of the Chemical Section of the British Association, delineated the probable future of chemistry in his inaugural address. The question, he said, had frequently suggested itself to him, will chemical science go on expanding and developing during the next few generations, as it has done in the course of the last hundred years, or will there be limits to systematic chemistry—i. e., to the history and description of all possible combinations of the elements? He was inclined to take the latter view. He thought it probable that in the course of time, at the rate at which we are now progressing, nearly all possible compounds will have been prepared, all the most important chemical facts will have been discovered, and pure chemistry will be practically exhausted, and have arrived at the same condition as systematic botany and mineralogy, with only rarely a new plant or mineral to be determined, now are. But chemical science would not cease. It would continue to develop, but in other directions than those previously pursued. As the botanist has still a wide field of investigation in physiological

botany, so the chemist will find extensive opportunities for research in such investigations as those of the processes whereby the substances constituting the various organs of plants and their contents are formed, and those again to which the decomposition and decay of vegetable matter are due; subjects as to which our knowledge is quite elementary, but which, it seemed to him, admitted of an extension and development of which we have at present not the least conception. The very first steps of the process whereby organic or organized matter is formed in plants are hardly understood. Granted that we are able to trace the formation in a plant of a compound of simple constitution, such as oxalic or formic acid, how far would we still be from understanding the building up of such compounds as starch, albumen, or morphia? The syntheses so successfully and ingeniously carried out in our laboratories do not here assist us in the least. We know the steps by which alizarine is artificially produced from anthracene; but does any one suppose that the plant commences in the same way with anthracene, converting this into anthraquinone, and having acted on the latter first with acid, then with alkali, arrived at last at alizarine? Indeed, the plant never contains ready-formed alizarine at all. What we have observed from the beginning is a glucoside, a compound of alizarine and glucose, which, so far as we see, is not gradually built up, but springs into existence at once. With respect to the decomposition of organic and organized matters, the author was inclined to think that some of the younger chemists and physiologists of to-day might live to see the time when all the now mysterious and unaccountable processes going on in the organisms of plants and animals, including those of fermentation, will be found to occur in accordance with purely physical and chemical laws.

In a lecture on the rate of explosion in gases, delivered during the meeting of the British Association, Prof. Harold B. Dixon illustrated his subject by performing the experiment of filling a vessel full of hydrogen and allowing it to siphon itself out while the air penetrated into the vessel and mixed with the hydrogen. This experiment, the author said, exhibited the three divisions of gaseous explosions: the ordinary combustion; the vibratory movement, due, he believed, to the explosion of the air and hydrogen in unison with the mass of the gas in the tube; and the explosion of the whole mass. He believed there was some relation between what he might call the mean velocity of translation of the products of combustion and the bodies burned, which would be found to coincide with the actual rate of explosion. The study of explosions was of double interest—an interest attaching to the power which it offered in the hands of men, and a grander theoretical interest attaching to the play of the natural sources here shown in great intensity. In their ordinary questionings of nature we were ac-

customed to experiment only at an atmospheric pressure, a few pounds on the square inch, and at only a few hundred degrees removed from absolute cold. Under other conditions we had the temperatures of the suns and stars which might be measured by thousands of degrees; we had pressures in the center of the earth which might be measured by millions of atmospheres; and we had motions of masses of planetary matter which might be measured by hundreds of miles in a second. Without reaching these extreme limits, the study of explosives widened our range of experience, and as such it must lend some efficient aid to the advance of science.

CHILI, an independent republic of South America. (For details relating to area, see "Annual Cyclopædia" for 1884.) The population of Chili, according to the last census, taken on Nov. 26, 1886, is 2,524,476.

Government.—The President is Don Manuel Balmaceda, whose term of office will expire on Sept. 18, 1891. The Cabinet was composed in 1887 of the following ministers: Interior, Don Anibal Zañartu; Foreign Affairs, Don Miguel Lamunátegui; Justice, Don Pedro L. Cuadra; Treasurer, Don Agustín Edwards; War and Navy, Don Manuel García de la Fuente; and Public Works, Don Pedro Montt. The Chilean Minister to the United States is Don Domingo Gana. The Chilean Consul at New York is Don Justo R. de la Espriella; and the Consul-General at San Francisco, Don Juan de la Cruz Cerda. The United States Minister to Chili is Hon. William R. Roberts.

Army and Navy.—While the rank and file remained 5,541, the number of officers, toward the close of 1886, was reduced from 970 to 928, the National Guard being at the same time, for the three arms, fixed at 48,674 men.

The Minister of the Navy, Aug. 20, 1886, reported that the navy consisted of two iron-clads, one monitor, three corvettes, two gun-boats, three cruisers, one steam transport, four *escampavaia*, six pontoons, and nine torpedo-boats, the armament of the fleet being 75 guns; the joint tonnage 17,080, with 4,550 horsepower, manned by 1,481 sailors. Adding the officers, engineers, and garrison, the number of men serving in the fleet aggregated 2,478. In September, 1887, this number was increased by decree to 2,800, to be raised if need be to 6,000. The number of cadets in the naval schools was fixed at 150, volunteers, after serving their time, to be entitled to 108,900 square metres of Government land, and the premiums to be paid them as follows; \$200 to those enlisting for the first time; \$250 to those re-enlisting; and \$300 to those serving a third term.

In August the Government ordered Don Enrique Simpson, Captain of the Navy, to draw up a project of fortification for the ports of Iquique, Antofagasta, Coquimbo, Valparaíso, Talcahuano, Lota, Corral, and Ancud.

A commission of engineers was sent from

Valparaíso to Fiume, Austria, to study the construction of Whitehead torpedoes.

The French firm of George Chantiers, naval architects, made proposals to the Government in September, 1887, to build a steel-clad of 6,000 tons, furnished with all the latest improvements of naval warfare.

Finances.—In spite of the costly war with Peru and Bolivia, the public debt amounted on Jan. 1, 1886, to but \$83,653,737, being composed as follows: Foreign indebtedness, payable in gold, \$33,733,500; home indebtedness, bearing from 8 to 9 per cent. interest, \$23,282,321; paper money in circulation, \$26,687,916. Total, \$83,653,737. On Jan. 1, 1887, the foreign debt stood, \$34,601,270; and the internal debt, \$49,223,429. Total, \$83,824,699. The total increase consequently was, \$170,962, the home debt having decreased \$686,808, and the foreign debt increased \$867,770. Toward the close of 1886 the Chilean Government succeeded in converting into £6,200,000 4½-per-cent. bonds, at 98½; £852,100 1858 4½-per-cent.; £1,244,800 1867 6-per-cent., and £3,696,800 1870, 1873, and 1875 5-per-cent. old outstanding bonds. The proceeds, while canceling the old bonds, left besides £315,000 for Peruvian bondholders. The report of the Chilean Minister of Finance, June 1, 1887, showed that in 1886 the amount of money received into the treasury was \$65,764,588, which included the \$14,652,331 surplus from 1885. The expenditure in 1886 was \$49,413,775.

War Claims.—During 1887 negotiations continued between Chili and Germany with respect to fourteen claims presented by German subjects for losses suffered by them during the war in the Pacific. The Italian Government also holds heavy claims in behalf of Italians, and demands that at least 20 per cent. of the amount claimed shall be paid. The French Government, tired of the continuous disputes that have occurred in consequence of the French claims, has offered to accept a round sum of \$1,000,000 in coin, which it would distribute among French neutral citizens who were sufferers by the war.

Commerce.—The foreign-trade movement in Chili has been as follows:

MOVEMENT.	1885.	1886.
Import	\$41,218,723	\$47,101,820
Export	51,480,286	53,581,641
Total	\$92,709,011	\$100,683,991
Increase		7,973,980

The chief exports of 1886 consisted of: Products of the mines, \$40,264,840, showing a decrease, as compared with the previous year, of \$1,785,331; agricultural products, \$9,710,747, being \$1,783,401 greater than in 1885; manufactures, \$172,900, being \$31,000 more; and specie and bullion, \$644,416, being \$3,138 less. The amount representing nitrate exportation was \$1,424,075 less than in 1885; cop-

per in bars showed \$1,237,745 decrease, and silver in bars, \$202,187, all due to the decline in values, and reduced quantities shipped, so far as copper is concerned. Products of agriculture, of the mills, and stock farms showed the following items of increase: Wheat, \$917,514; wool, \$425,816; barley, \$124,668; oats, \$127,398; flour, \$37,907. During the first nine months of 1887, Chilean copper exportation did not exceed 22,872 tons, against 30,212 tons during the corresponding period of 1886. The Chilean exportation of nitrate of soda has been as follows:

DESTINATION.	1884.	1885.	1886.
	Quintals.	Quintals.	Quintals.
To Northern Europe	10,890,810	8,534,637	7,950,452
To the Mediterranean	156,576	41,930	168,092
To the United States on the Atlantic	1,211,714	897,296	1,436,159
To the United States on the Pacific	49,078	77,712	255,505
Total	11,838,178	9,501,625	9,805,288

The American trade with Chili has been as follows:

FISCAL YEAR.	Imports from Chili into the United States.	Domestic exports from the United States to Chili.
1883	\$435,584	\$2,887,551
1884	587,986	3,286,945
1885	604,523	2,192,674
1886	1,152,945	1,973,548
1887	2,868,238	2,062,507

In August, 1887, the Chilean Chambers passed a law exempting from import duties articles introduced for mining and other industrial purposes.

Merchant Marine.—There were afloat under the Chilean flag, on May 1, 1886, 37 steamers, with a joint tonnage of 18,525; 7 ships, with 8,461 tons; 88 barks, with 44,343 tons; 5 brigs, with 1,514; 7 schooner-brigs, with 2,148; 11 schooners, with 1,182; and 18 sloops with 1,112; together, 173 vessels, with 77,285 tons, being an increase for the year of 2 steamers and 5 sailing-vessels.

Railroads.—The Republic of Chili, which will soon be in intimate connection by transcontinental railways with the Argentine Republic, is rapidly developing its great resources. The geographical configuration of the country, long and narrow, with a great coast-line, and more than fifty seaports, makes it unusually independent of railroads as means of communication. But Chili was the first of the South American nations to introduce railroads and telegraphs, and while Brazil, Peru, and the Argentine Republic have a greater mileage, Chili, in proportion to population, still stands at the head, both in railways and telegraph lines. Of the latter she has 15,000 kilometres in operation; of railways, 2,500 in operation, and 3,000 more in process of construction. The Chilean Senate has unanimously voted a subsidy to be used in completing the gap of 140 miles to connect the Chilean system with that

of the Argentine Republic. The Chilean Government has caused surveys to be made with a view to the extension of the Palmilla and San Fernando Railroad to the coast. It was found that the extension would have to be 85 kilometres long, and would cost 3,000,000. It is probable that the work will be taken up in sections, the first and most practicable of which, from Palmilla to Alcones, is fully half of the entire proposed extension, estimated not to exceed in cost \$750,000.

In December, 1886, the Arauco Company was incorporated in London for the purpose of carrying out a concession granted by the Chilean Government in October, 1884, to build a railroad from Concepcion to Rios de Curanclahue, and undertake certain public works in the province of Arauco, and other portions of Chili.

In 1887 tramways were laid in the principal streets of Concepcion. The new viaduct between Concepcion and Curanclahue, in course of construction, will be the third highest in the world.

The Grace Contract.—The Chilean Government having taken umbrage at certain clauses of the Grace-Aranibar contract between Peru and her bondholders, the Peruvian Government abstained from carrying out the agreement. Chili based her objections on two of the principal clauses of that document. First, the implied assertion that she is responsible for half of the Peruvian foreign debt, as she has seized the property by which that obligation was guaranteed, whereas, by the treaty of peace she declared that she would hand over to the bondholders half of the net proceeds of the guano she might sell abroad, and the Peruvian debt was never alluded to. The second objection is based on the immigration of Europeans to Peru, proposed in the contract, and the large grants of land to be given to the Grace Company. Chili declared that this was nothing but handing over the independence of Peru to a foreign power, and that the Monroe doctrine, established by the United States, would forbid such concession.

Telephones.—Communication by telephone was opened during the summer between Santiago and Valparaiso.

Electric Light.—The city of Coquimbo adopted and received in 1887 the electric light for illuminating its thoroughfares.

New Lazaretto.—The Chamber of Deputies passed a bill, early in 1887, creating a lazaretto and provisioning station of infected vessels at the Islands of Juan Fernandez.

New Colony.—During the latter part of 1885 a colony was founded by agricultural immigrants at Ercilla, in Araucania, and in less than a year the village had all the appearance of a civilized community, and the adjoining farms were in a prosperous condition.

Cholera.—The cholera invaded Chili by land from the Argentine Republic toward the close of 1886, the sanitary cordon having been

broken despite the severest quarantine measures. It ravaged Ohili till the summer, and up to May 21 there had been 899 cases at Valparaíso, of which 628 proved fatal; at Quillota, out of 1,959 attacked, 1,002 died.

Mineral Resources.—The province of Coquimbo has become remarkable for the production and exportation of manganese. In 1885 the exportation reached 3,753 tons, and during the first half of 1886 it was 38,802 tons. Nearly the whole of this was shipped to England. A mine of good coal was discovered in the latter part of 1886, on the island of Chiloe, which has been bought and is worked by an English company. This discovery is the more important as Ohili has so far been obliged to import coal from England and Australia. At Esmeralda a rich silver-mine was discovered toward the close of 1886, in addition to similar discoveries made in that locality three years previously. About \$3,000,000 was taken out during the interval. A company was formed in New York in 1887, with a capital of \$300,000, for the purpose of doing a general milling and smelting business in Ohili. Important gold discoveries were made in 1886 at Condoriaco, in the province of Coquimbo.

Industries.—Chilian wines are so excellent that they begin to attract attention in France, prizes having been awarded them at the last exhibition in Bordeaux. The Argentine Republic is Chili's best market at present for her wines.

Oysters.—Viscount V. R. de Solminhac, a Frenchman, has applied to the Government for a concession to plant oyster-beds along the Chilian coast.

The export from Ohili to France of the berries of the Chilian shrub *Aristotelia Magin*, of the *Tiliaceæ*, was begun in 1886. It is used in Ohili for the purpose of coloring wines. Every portion of the plant is utilized; the leaves have medical qualities, the wood is used for cabinet-work, the bark for tanning.

On Nov. 1, 1887, an international exhibition was opened at the Agricultural Experimental Garden in Santiago, of machines adapted to separating flax from the fiber, stem, and leaves of the flax-plant, a prize of \$1,000 being offered for the machine that should be decided by the jury of award to be the one best fitted for the work.

It was resolved in the summer of 1887 to convert the large sugar-refinery of Julio Bernstein at Vifa del Mar, near Valparaíso, into a stock company. As Chili has hitherto been dependent for the large amounts of refined sugar consumed in the country on importation from Europe and the United States, this industry has undoubtedly a promising future.

Large quantities of wool are being bought in Peru and Bolivia, and new factories are being erected in Ohili. The Government has given an order for 18,000 woolen blankets and 21,000 yards of woolen cloth to be used in supplying the police and the army.

Education.—The state devotes \$3,000,000 a year to public instruction, which is free in all grades, and the country has 1,500 primary schools, which are attended by more than 100,000 children.

CHINA, an empire in Eastern Asia. The Emperor is Hwangti, surnamed Kwang-seni, son of the Prince Ch'un, or Seventh Prince. He was born in 1871, succeeded to the throne by proclamation in 1875, and assumed the government of his dominions on attaining his majority Feb. 7, 1887; yet the Empress Regent still exercises, to a large extent, the royal prerogative. The Emperor's father, though precluded from holding any official post, has, for some years, been the leading statesman in China. The highest official body is the Nei-ko, consisting of four members, with two assistants from the Han-lin; who see that the acts of the ministry conform to the laws. Under the four ministers are the seven government boards, viz.: the Board of Civil Appointments; the Board of Revenue; the Board of Rites and Ceremonies; the Army Board; the Board of Public Works; the Tribunal of Criminal Jurisdiction; and the Admiralty Board. (For statistics of area and population, and the army, see "Annual Cyclopædia" for 1886.)

Finances.—The revenue of the Imperial Government is known only by estimates. A writer estimates the ordinary revenue for 1885 at 64,000,000 taels, or about \$87,000,000, of which 20,000,000 taels represent the portion of the land-tax that is payable in money; 7,000,000 taels the rice tribute to Peking, and the rice levy in the provinces; 9,500,000 taels, the salt-taxes; 18,000,000 taels the foreign customs; 5,000,000 taels the native maritime and inland taxes, and the new levy on opium; and 9,500,000 taels, levies on native opium, and on various other goods, native and foreign. The receipts from foreign customs are published regularly. They amounted, in 1885, to 14,472,766 taels. The larger expenditure is on the army, the cost of which is estimated to be about \$75,000,000 per annum. The total foreign debt in 1887 amounted to about \$25,000,000. A loan of 5,000,000 marks, bearing 5½ per cent. interest was contracted in Berlin in 1887, being eagerly taken at a premium. The Imperial customs department is managed by foreigners, with an Englishman at the head, under whom are a large staff of European, American, and Chinese subordinates. It is organized similarly to the British civil service.

In accordance with conventions concluded with foreign powers, the *likin* and barrier dues can be commuted by payment at the custom-house of 2½ per cent. ad valorem, on all imported goods. A transit-pass is then issued which protects the goods from all local dues between the port and the market. The consolidated tax is much less than the aggregate of the separate dues, but the Peking Government agreed to it because the money goes into the Imperial treasury, whereas the *likin* tax

was collected by the provincial authorities. The provincial administrations have, however, succeeded in evading the agreement, by assessing consumption duties on Chinese purchasers of foreign goods, asserting that they have the right to tax their own subjects.

The Navy.—Five new vessels left Europe in the autumn, under the command of Admiral Lang, a captain in the British Navy, who is commander of the North China fleet. Two of them are swift, protected cruisers, built in England, and named the "Chih Yuen" and the "Ching Yuen." Their displacement is 2,800 tons, the length 268 feet, the draught 16 feet. They are divided into water-tight compartments, and have double sets of engines and double bottoms. Their speed is 18½ knots. The armament consists of three 21-centimetre Krupp guns, two 6-inch Armstrongs, eight rapid-firing six-pounders, and six Gatlings. Two others are armored cruisers built at Stettin, named the "King Yuen" and the "Lai Yuen." They can steam 16 knots, and are armed with two 21-centimetre Krupp guns, mounted *en barbette*, and two 6-inch guns. The fifth vessel is a torpedo-boat, that has a maximum speed of 28 knots, and is armed with two torpedo-guns in the bows, one on deck, and Hotchkiss and Gatling guns.

Education.—Literary knowledge is the only passport to official station; and a large section of the people devote their lives to the study of Chinese literature and the difficult art of literary composition, forming a special lettered class. Examinations are held annually for literary degrees, and the successful candidates are eligible for vacant posts in the public service. Within a short period, schools have been established for instruction in European learning, especially the physical and mathematical sciences and technical branches. Many valuable works have been translated into Chinese. The principal seminary for Western science and literature is the Tong Weng College in Peking, a Government institution, presided over by an American, Prof William A. P. Martin, in which European and American instructors teach mathematics, astronomy, meteorology, natural history, physiology, anatomy, chemistry, and the English, French, German, and Russian languages, and Chinese professors impart the standard Chinese education. There are a number of colleges at Shanghai under the direction of Roman Catholic and Protestant missionaries; also elementary schools at that and other seaboard cities, where ordinary branches of science and the English language are taught. Military and naval academies and torpedo-schools have recently been established in connection with the arsenals at Tientsin, Foochow, and Shanghai, in which European methods of warfare and Western languages and literature are taught by foreigners.

Commerce.—The total value of the imports in 1885 was \$8,200,018 haikwan taels, or \$114,600,000; the value of the domestic exports,

65,005,711 haikwan taels, or \$84,500,000. The chief imports were in value as follow:

IMPORTS.	Taels.	IMPORTS.	Taels.
Opium	23,483,914	Woolen goods	4,824,066
Cotton goods	81,492,822	Metals	5,502,416
Raw cotton	1,298,007	Coal	1,785,875

The leading exports in 1885 were valued at the following amounts:

EXPORTS.	Taels.	EXPORTS.	Taels.
Tea	82,269,040	Straw braid	1,574,304
Silk	20,001,175	Hides	941,118
Sugar	1,885,608	Paper, tinfol, etc.	695,752

The imports to and exports from the principal foreign countries in 1885, were of the following values in taels:

COUNTRIES.	Imports.	Exports.
Hong Kong	35,268,197	15,669,367
Great Britain	23,991,688	21,992,155
India	16,148,751	568,567
United States	8,815,402	2,297,732
Japan	5,268,918	1,491,296
Russia	194,668	4,852,800
Other European countries	2,518,247	7,904,370

During 1885 the number of vessels entered and cleared at Chinese ports was 23,440, of 18,068 tons; of which 18,691, of 17,012,930 tons, were steamers. Of the total tonnage, 11,842,255 tons represented British vessels, 2,261,750 American, 2,243,584 Chinese, 1,217,685 German, 211,585 Japanese, and 73,855 French.

Railroad Construction.—The Government has authorized the construction of a line of railway north of the Peiho from Taku to Tientsin.

American Concessions.—An important charter was provisionally granted during the summer of 1887 to an American syndicate. The negotiations had been carried on for two years, on behalf of Wharton Barker, a banker of Philadelphia, and others, by the Count E. O. Mitkiewicz, an American citizen of Polish birth. The concessions embraced the privilege of establishing the American system of banking and coinage, and a scheme for introducing railroads of the American type; also a postal service, mining privileges, the construction of telephone lines, and the extension and operation of the telegraphs. The *cessionnaires* were to establish a mint for the coinage of silver on a system based partly on the American and partly on the Japanese coinage. They were to have the right to issue paper money on the plan of the American national banking system, and the refusal of Imperial loans. The syndicate proposed to construct first a railroad from Tientsin to Shanghai, a distance of 900 miles; then one from Shanghai to Nankin, and thence to Canton, 1,000 miles long; and afterward other lines, including one to the Russian frontier, and others designed to develop the working of the coal-fields and iron-deposits. It also intended to erect mills for making rails and rolling-stock, and to introduce both the long and the short telephone systems. The concessions were actively opposed by the English and Germans, but received diplomatic support from Russia. The

negotiations were carried on with the Viceroy Li-Hung-Chang. After they had been concluded to the satisfaction of the Tsung-li-Yamen, the opposition was still continued, and the Imperial sanction was finally withheld.

New Policy Toward Christians.—The Chinese Government has carried into execution the policy that it announced after the Tonquin hostilities of no longer recognizing France as the protector of Catholic Christians in China. The negotiations for the removal of the Peh-tang Cathedral overlooking the garden of the Imperial palace at Peking were conducted at the Vatican by John Dunn, an Englishman in the Chinese civil service. The Lazarist society, which constructed the cathedral over a century ago, and the Pope were entirely willing that the site should be changed, while the French at first resisted, but finally acquiesced. The Chinese Government gave the ground for the new cathedral and the money for its construction, stipulating that the edifice should not be over fifty feet high, which is thirty feet lower than the old one, and that the bell-tower should not be carried above the roof-ridge. Bishop Tagliabue and another missionary who aided in the negotiations, were made mandarins. The corner-stone of the new building was laid on May 30, 1887. The Pope was coerced by the French Government in 1886 into abandoning his intention of sending a legate to Peking in accordance with the request of the Imperial Government, but a Chinese envoy was received at the Vatican, and Monsignor Agliardi, the Papal delegate to the East Indies, was authorized to treat with the Chinese Government, which in March, 1887, assented to this temporary arrangement, while reiterating its desire for the establishment of direct diplomatic relations. The Vatican is practically represented at Peking by the Bishop of North China, Tagliabue. When the French consul in Canton interfered on behalf of some native Christians, Chang Ohih-tung, the viceroy, denied in the strongest manner his right to make representations regarding Chinese subjects. In accordance with instructions from Peking, the viceroys of the various provinces issued proclamations calling on the people to live at peace with the Christians, and explaining that the Christian religion teaches men to do right and aims to make them better citizens, and that the converts are not the less Chinamen because they are Christians, and have the same duties, and are entitled to the same protection as their neighbors. Formerly the French missionaries have obtained for their flocks, owing to the fears and ignorance of the local authorities, immunity from taxation and from the jurisdiction of the courts, claiming that they were under French protection. In the proclamations that were put forth by the governors the Christians were warned that they owed the same obedience to the laws as other Chinese, while all others were threatened with punishment if they committed unlawful acts against

Christians, or disturbed their congregations. Anti-Christian riots took place in Chung-King in the province of Szechuen, in the course of which the house of a wealthy Christian named Lo was attacked. In defending themselves the inmates killed several of the assailants. The authorities arrested Lo, and on trial he was sentenced to death. At the solicitation of missionaries, M. Constans, the French minister, with some reluctance, represented to the Chinese Government the injustice of the sentence, with the result that Lo, who is said to have committed many previous offenses and escaped punishment through the protection of the missionaries, was immediately beheaded. Toward the close of April the Chinese Government ordered that all foreign missionaries must henceforth procure passports from their own Governments, as no others would be recognized. The German, Italian, and other Governments, had expressed their readiness to assume the protection of their own subjects, and had issued passports to Roman Catholic missionaries.

Treaties with France and Portugal.—The treaty that was concluded with France in the spring of 1886 was so distasteful that the French Government refused to ratify it; and, recalling M. Gogordan, sent out M. Constans to reopen negotiations and endeavor to secure better terms. The principal concession granted to France was the opening of two places for trade above Langson and Laokai, through which the French might carry on commerce with the provinces of Yunnan and Kwangsi. The import duties were made a little lower than at the treaty ports. The admission of a French agent in Yunnan was strenuously refused; yet the right of China to appoint consuls throughout Tonquin was accorded, though the English have persistently refused to allow Chinese official representatives to reside at Hong-Kong or Singapore. The French were greatly disappointed at not being permitted to import opium into China, for they expected to raise the poppy successfully in Tonquin, and soon compete with the Malwa and Patna product. After a year's negotiations, by showing complaisance in regard to the protection of Roman Catholics, exercised by France for thirty years, and by giving up the promontory of Paklung on the Tonquin frontier, which both parties claimed for strategic reasons, M. Constans obtained more favorable commercial conditions. He was unable to secure the right to import salt into China, because that article is an Imperial monopoly and the source of a considerable revenue, but inserted a clause that the salt-farmers may purchase their supplies in Tonquin. The prohibition of the opium import from Tonquin was withdrawn, allowing the French to grow the drug for the southern Chinese if they can with profit, or to bring it in the raw state from Yunnan and manufacture it in Tonquin for the Chinese market. Finally the Chinese Government agreed that four places should be opened on the frontier to

French trade, instead of two, and that the customs tariff, which by the previous treaty was one third less than at the coast-ports, should be further reduced.

A treaty of friendship between Portugal and China has been under discussion for twenty-five years, without a definite result, until a protocol was signed at Lisbon in March, 1887, and a treaty was concluded at Peking in June. By this treaty the Chinese secured the co-operation of the Portuguese authorities in the suppression of opium-smuggling. In accordance with the provisional treaty, the Governor of Macao, on April 1, 1887, put into force the same measures in regard to the opium-trade that were established at Hong-Kong.

Retrosession of Port Hamilton.—In January, 1887, negotiations were concluded for the transfer of Port Hamilton, which the English had seized upon during the Russian war scare, to China, and shortly afterward the British naval commander formally surrendered the place to Chinese occupation.

Frontier Negotiations with Russia.—After the conclusion of the boundary treaty with Russia in relation to the Amoor region, on Nov. 4, 1860, the boundary was marked off, and since it followed the course of rivers for the most part, there have since arisen few difficulties. At the coast the bank of the river Tiumen formed the Russian boundary for seven miles, the opposite bank being Korean territory. The Russian Government requested recently a delimitation of the frontier, and Chinese and Russian commissioners were appointed, and a protocol has been signed which, besides some trifling changes, declares the mouth of the Tiumen and the Gashkiavetch Gulf, which is an inlet of the estuary, to be Russian, and includes an arrangement for the navigation of the river, according to which vessels under the Chinese, Korean, and Russian flags have the exclusive right to ascend the river, unless the contracting powers agree to extend the right to other nations.

CHRISTIAN CHURCHES. The "Quadrennial Book" of the American Christian Convention gives as connected with that body 1,827 ordained and 209 unordained ministers, with 1,662 churches. The entire number of members is about 122,000. Eight colleges, institutes, and seminaries are under the charge of the Convention or of churches affiliated with it.

The Christian Church, a body in the Southern States, holding principles similar to those of the American Christian Convention, has 75 churches, 127 ministers, and 18,000 members.

The Christian Union Churches, which exist chiefly in Ohio and States west of it, comprise 15,000 churches, with 500 ministers and 120,000 members.

A joint Committee on Union of the American Christian Convention and the Christian Union Churches met in Covington, Ohio, July 26th. Dr. N. Summerbell was elected chairman. The following report, drafted by a sub-

committee appointed for the purpose, was unanimously adopted:

The Committee on Union from the "General Council of the Christian Union," and from the "American Christian Convention," met at Covington, Ohio, July 26, 1887. After full and frank discussion of the resolutions on union, passed by both bodies, it appeared plain to all that we in aim and spirit practically are one people; and we find no valid reason why we should be separate. In the discussion, and in this report, it is unanimously agreed that it is a fundamental principle of Protestantism, and a well-established question of biblical interpretation, that "the Church and the State should be separate," and that true liberty and efficiency of service in the Church are best obtained by a congregational form of government; and, therefore, in the absolute independency of the local church that all matters of business, service, and worship, shall be decided by each local church for itself.

Therefore, your committees in joint session agree and recommend the union of the two bodies upon the following principles:

The Holy Bible our only rule of faith and practice. Christ the only Head of the Church.

Christian character the only test of fellowship.

Individual interpretation of Scripture the privilege and duty of all.

The union of all the followers of Christ without controversy.

Each local church absolutely independent in government.

And, further, we agree and recommend that in the united body the individual believer be known as "a Christian"; that all the churches retain their present local names; conferences and councils be known hereafter as assemblies of Christians, and that the general body, head and representative of the union herein sought, shall be "The General Assembly of Christians in America."

And, lastly, we agree that this basis be presented to the various conferences and councils, and through them to the local churches for their ratification and adoption.

CITIES, AMERICAN, RECENT GROWTH OF. This subject is continued from the "Annual Cyclopædia" for 1886, and will be further continued, with other cities, in the volume for 1888.

Allentown, a city, and the capital of Lehigh County, Pa., on the west bank of Lehigh river, 18 miles above its confluence with the Delaware. In relation to the surrounding cities, it is almost the mathematical center, Wilkes-barre and Scranton lying 85 miles to the north, New York 90 miles to the east, Philadelphia 60 miles to the south, and Harrisburg 85 miles to the west. Transportation to the north, south, east, and west is amply afforded by the Lehigh Valley, the Lehigh and Susquehanna, the Philadelphia and Reading, and the Perkiomen railroads, and the Lehigh Coal and Navigation Company's canal. Allentown dates from the middle of the eighteenth century. The first house was erected by William Allen in 1753, and nine years later the town was founded by him upon a grant of 3,000 acres from Joseph Turner, to whom it had been assigned by Thomas Penn. In 1838 its former name, Northampton, was changed to Allen's Town, in honor of its founder. The population, numbering 25,000, is composed mainly of Pennsylvania Germans and natives of German and Irish descent. The Lutheran and Reformed

denominations predominate. Allentown, although the center of a rich mineral and agricultural district, depends mainly upon its varied manufactures, the most important of which are of iron and iron products, silk, furniture, cigars, linen thread, boots and shoes, barbed wire, leather, hosiery, brick, and lime. Its public buildings are substantial and commodious. Muhlenberg College and Allentown Female College afford accommodation for higher education. Allentown enjoys many advantages, chief among which are its natural drainage, its water-supply, its proximity to limestone, iron, cement, and slate formations, and its rich agricultural surroundings.

Amsterdam, a city of Montgomery County, N. Y., on the north side of the Mohawk river, 38 miles west of Albany. The population in 1870 was 7,706; in 1880, 11,710; in 1888, 17,408. It is a thriving manufacturing center, and was incorporated as a city in 1885. The New York Central and Hudson River Railroad passes through, leaving 1,042 car-loads of freight, and receiving 600 car-loads monthly. It is touched on the south side of Mohawk river, at Port Jackson, by the West Shore Railroad and the Erie Canal. In 1882 a system of water-works was constructed at a cost of \$271,221, which is one of the best in the country, having a pressure in the principal business center of 133 pounds to the square inch. In 1887 were laid 742 miles of sewers, under the separate system, at a cost of \$80,000. The work will be continued until the city is completely sewered. Street-cars traverse the principal streets, and electric lights have been introduced. The free schools occupy four buildings, one erected in 1884 at a cost of \$12,000. There are 13 religious societies, and 11 churches, 4 erected in 1887. Three lines of stages connect the city with outlying villages. There are 3 national banks, 1 private bank, 1 savings-bank, 3 daily newspapers, 5 weeklies, and 1 monthly, a Children's Home, a Young Men's Christian Association, and a Board of Trade. One carriage-spring manufactory employs 125 hands. There are also 1 burial-case manufactory, 2 planing-mills, 3 machine-shops and foundries, 1 paper-mill, 2 paper-box factories, and 2 dyeing establishments. The broom industry employs \$300,000 capital and 600 hands, with a daily output of 15,000 brooms and broom-brushes. The Amsterdam Linseed-Oil Works, established at Galway in 1824, removed to Amsterdam in 1857, consume 750,000 bushels of flax-seed yearly, producing 1,700,000 gallons of oil, and 15,000 tons of oil-cake. The works employ 100 men. Carpet manufacturing employs 275 looms and 2,100 persons, with an annual output of 4,000,000 yards. In the manufacturing of knit goods there are 15 firms, with 112 sets of machinery, and 25,176 spindles, producing 2,980 dozens of garments daily, and employing 2,190 hands. The total value of manufactured products is \$8,500,000. The total assessed valuation of the city is \$7,000,000.

Atlantic City, a health-resort on the Southern New Jersey coast, about 65 miles southeast of Philadelphia, with which city it is connected by rail. Atlantic City is built on an island known as Absecon Beach, a ridge of sand about half a mile wide and ten miles long, five or six miles from the main-land. The population in 1880 was 5,477; in 1885, 7,942; in 1887, estimated at 10,000. Atlantic City is altogether a health-resort, having no manufacturing industries whatever. It is supplied with excellent water from the main-land, has a complete system of underground drainage, and has three banks and two newspapers. The streets are regularly laid out, lined with shade-trees, and graded and graveled. There are about one hundred hotels and boarding-houses, one third of which are open all the year. During Lent, Atlantic City is thronged with fashionable visitors from Philadelphia and New York. The city is governed by a Mayor and Common Council, has a Board of Health, a Board of Trade, a dozen churches, fifteen different secret societies, ten physicians, as many lawyers, and a public-school system that employs more than thirty teachers. The city is lighted with gas and electricity. A board walk, or elevated beach promenade, extends along the beach front a distance of about three miles, which at all seasons is a favorite resort for promenaders. Building operations are extensively carried on during the autumn and spring. Absecon Light-house is the only Government building. There are many cottages and summer residences.

Bradford, a city in McKean County, Pa., on Tuna creek, a tributary of Allegheny river, 125 miles by rail north by east from Pittsburg, and 62 miles south by east from Buffalo. The population in 1870 was 400; in 1880, 9,127; and in 1887, was estimated at 12,000. Four systems of railroad enter the city, one of which operates three diverging lines, and a horse-car railroad traverses the main streets, running to the suburb of Tarport. The manufacturing interests comprise three large oil and gas well supply-works, a large tooth-pick factory, and numerous smaller industries. The growth of the city has been remarkable, as it had a population of only 500 in 1875 when the petroleum development around it was begun. It is the center of the great Bradford oil-field, which contains 100,000 acres of productive territory, on which over 15,000 wells have been drilled, at a cost of \$38,000,000. About 14,000 of these are still producing an aggregate of 22,000 barrels a day. The field has already produced nearly 145,000,000 barrels of oil, which has been sold for over \$100,000,000. The transactions in the Bradford Oil Exchange since its organization in 1879, have averaged 1,500,000 barrels daily, and on one day reached an aggregate value of \$3,000,000. The value of sawed lumber taken from the adjacent forests reaches \$3,000,000 annually. Six newspapers—3 daily, 2 Sunday, and 1 weekly—are published, and a monthly magazine devoted to

oil and natural gas. The city has been heated and lighted with natural gas since 1879, and was the first place where fuel-gas was systematically supplied and generally used. Two companies are piping gas to the city from the Kane district, 80 miles distant.

Chicopee, a township in Hampden County, Mass., incorporated as a town in 1848, when its territory was the north part of Springfield. It is about six miles square; its population numbers about 12,000. The assessed value of property is \$5,844,065. Its railroad communication is by the Connecticut River road. A horse-railroad to connect with the Springfield line has been surveyed, and is to be built in 1888. Its leading manufacture is cotton. Two companies have a combined capital of \$2,200,000, with 191,000 spindles and 4,673 looms; hands employed, 2,800; value of product, about \$3,200,000, consisting of sheetings, shirtings, flannels, and fancy goods. The Ames Company manufactures general machinery, bicycles, tricycles, tools, and bronze statuary; capital, \$500,000. The manufacture of agricultural tools is a large industry, with several shops. There are two shops for the making of society swords and military goods, including army swords. Other manufactures are pistols, rifles, shot-guns, knitting-machines, locks, factory reeds, and bobbins. There are three large brick-yards, established within a few years. There are three Catholic churches and eleven Protestant congregations, a town hall costing \$100,000, a free public library of 10,000 volumes, and two high-school buildings with philosophical apparatus; one national bank, and two savings-banks. There is a complete system of sewerage, with water-works for domestic and fire purposes. There are three post-offices—Chicopee, Chicopee Falls, and Wil-limansett.

Cohoes, a city in the northeast corner of Albany County, N. Y., at the junction of the Mohawk and Hudson rivers, nine miles north of Albany and three miles from Troy. Two railroads and two canals pass through the city, and three horse-railway lines lead to Troy, Lansingburg, and Waterford. The city has within three years expended \$90,000 for additional water-works, consisting of a new reservoir, holding 70,000,000 gallons, new pumping apparatus, and street-mains. An electric-lighting plant, operated by water-power, was established in 1887. The hydraulic canals of the Cohoes Company, which supply power for all the mills, have recently been permanently improved by vertical stone embankments. The cotton-cloth mills operate 266,000 spindles, and produce 85,000,000 yards of cloth, valued at over \$3,000,000, and consume 27,000 bales of cotton annually. The same mills in 1876 operated 258,000 spindles, and produced less

than 80,000,000 yards of cloth. Twenty-five mills, operating knitting machinery and employing the equivalent of 205 standard (40-inch) sets of woollen cards, produce annually knit underwear of the value of \$4,600,000, and consume 16,450 bales of cotton and 3,860,000 pounds of scoured wool. In 1876 there were 17 knitting-mills, with 118 like sets of cards, and the annual production was valued at \$3,426,000. A rolling-mill, which in 1876 turned out 6,900 tons of rolled iron, worth \$355,800, has been enlarged so as to produce the past year 11,500 tons, worth \$575,500 and tube-works, which ten years ago turned out annually steam, water, and gas wrought-iron piping, valued at \$100,000, have been enlarged so as to produce the past year \$750,000 worth. The manufacture of special knitting machinery has been nearly doubled in ten years, while that of axes and edge-tools has remained about the same. The population in 1875 was 17,482; in 1880, 19,416; in 1887, estimated at 22,000.

Erie, a city, port of entry, and county-seat of Erie County, Pa., on Presque Isle Bay, Lake Erie. It is 88 miles southwest of Buffalo, N. Y., 580 miles from New York city, and 450 miles northwest of Philadelphia. Population in 1870, 19,646; in 1880, 27,730; present population (estimate based on city census taken in 1885) 37,000. Erie is the terminus of the Philadelphia and Erie and the Erie and Pittsburgh Railroads, and is traversed by the Lake Shore and Michigan Southern, and the New

York, Chicago, and St. Louis Railroads. The streets are broad, and are laid out at right angles, and many of them are paved with asphalt. Horse-cars run through the principal streets. The manufactures are extensive and diversified, consisting of iron and brass, cars, stoves, boots and shoes, engines and boilers, machinery, pumps, organs, flour, sashes, blinds, woodenware, etc. The capital employed in

1886 was \$7,814,000; number of men, 4,642; value of product, \$10,585,000. There was a considerable increase of manufactures during 1887. The harbor is one of the finest on the lakes, being 5 miles long, 1½ miles wide, and land-locked. In 1887 nine vessels in the foreign trade entered and six cleared, with a total tonnage of 2,387. The coastwise arrivals were 832, with tonnage of 709,141; cleared, 845, with tonnage of 720,606. The principal receipts by lake are grain and iron-ore; the principal shipments, coal and general merchandise. The grain is handled by three large elevators. A new custom-house, court-house, and post-office building is nearly completed, at a cost of \$250,000 (see illustration). A new city hall is also approaching completion and will cost \$150,000. The State Soldiers' Home was recently completed at a cost of \$240,000. St. Peter's (R. C.) Cathedral, nearly completed, is the finest church edifice in the State, and will cost \$300,000. The city water-works were enlarged during the year, the present pumping capacity being 6,000,000 gallons daily, to a height of 287 feet in the reservoir, two miles from the lake. The city has recently been connected with the natural-gas wells of the oil region by a pipe-line about 70 miles long, and during the year gas very largely took the place of coal for fuel for domestic use and to some extent for manufacturing. Erie is itself on the edge of the natural-gas belt. It has had several wells for twenty-five years or more; but the pressure is light and the supply insufficient and uncertain. The city has 4 national banks, 1 savings-bank, 31 churches, 3 daily and 8 weekly newspapers, and 2 monthly publications. Two new railroad projects, which are likely to be consummated, are the Ohio River and Lake Erie road, of which Erie will be the northern terminus, and a short line connecting Erie with the New York, Pennsylvania, and Ohio Railroad.

Evansville, a city and port of entry of Vanderburgh County, Indiana, on the Ohio river, midway between Louisville, Ky., and Cairo, Ill. The population in 1870 was 21,300; in 1880, 29,248; in 1887, 46,800. Seven railroads radiate from it to Chicago, to Brazil, Ind. (in the block-coal field), to Peoria, Ill., to St. Louis, to Nashville, to Louisville, and to Princeton, Ky. The latter is intended to run to Memphis, Tenn., and Florence, Ala. There are three horse-car lines, a transfer railroad track through the city, and a belt railroad, and a suburban railroad to Newburgh, Ind., will be built in the spring of 1888. There are steamboat lines to Louisville, Cincinnati, Cairo, Nashville, Florence, Ala., Memphis, St. Louis, Vincennes, and Bowling Green. The city is one of the largest hard-lumber markets on the continent, and also a grain and leaf-tobacco market. It is situated over inexhaustible beds of bituminous coal, there being six mines within the city limits, employing 900 miners. The Government has a fine building for post-

office, customs, and court purposes, and a \$500,000 county court-house is being erected. There are 17 public school-houses, 39 churches, and a handsome city hall. In 1887, 67 steam-boats were registered here. There are 395 manufactories in the city, the principal products of which are: engines and boilers, mowers and reapers, sugar-mills, sorghum-evaporators, plows and stoves, chairs and furniture, bricks, drain-pipe, earthenware, cotton and woolen goods, bent-wood boxes, hames, horse-collars, iron-railing, wire-screens, doors, sash and interior house-fixtures, hard and soft lumber, flour, meal, hominy, and grits, barrels, brooms, carriages, wagons, burial-caskets, beer, wash-boards, wooden butter-dishes, segars, staves and heading, spokes and hubs, mattresses, monuments, artificial ice, hoes, ginger ale, crackers and cakes, overalls, blank books, architectural iron, and tin and galvanized-iron work. The total value of manufactured products for 1887 was \$18,957,000. The amount of capital invested is \$30,750,000, and the number of people employed in these industries is 10,800. Among the new manufacturing industries established during 1887, were fruit-canning works, malleable-iron works, veneer-mills and a hames factory.

Gloucester, a city and port of entry of Essex County, Mass., on the peninsula of Cape Ann, thirty miles north-northeast from Boston, to which it is connected by a branch of the Boston and Maine Railroad; there is also a line of steamers running to that port. It has a fine, safe harbor which is used as a refuge from the storms by the large fleet of fishermen and coast-wise vessels. It is the largest fishing-port in the United States, employing 419 vessels and boats, aggregating 28,848-97 tons of the finest crafts afloat, most of them being fast sailors and able sea-boats. The number of men employed is 5,000. There are 43 fitting-out establishments. The city comprises eight distinct villages, viz.: Magnolia, East Gloucester, West Gloucester, Riverdale, Amesquam, Lanesville, and Bay View (the two last-named are extensively engaged in granite-quarrying, shipping large quantities of excellent stone), and lastly the "Harbor," which comprises the central wards. There is a fine city hall, a public library building, custom-house, water-works, electric lights and gas, with all the modern improvements. A new high-school building is in process of erection, and there are several fine churches, among which is the elegant St. Anne's Roman Catholic Church, built of Cape Ann granite, with a convent and parochial school attached. The last census, 1885, gave a population of 21,703; it will now exceed 23,000. Is a noted summer resort with fine hotels and boarding-houses near the sea; two large tracts of land, one at Eastern Point of 400 acres, and Willoughby Park at Coffin's Beach, West Gloucester, 150 acres, have recently been purchased and are being laid out for first-class summer company. Coffin's Beach

is the finest on the coast, about 2 miles in length and 600 feet in width from high to low water mark, clear, hard sand. There are several manufactories, including anchor-works, a twine-factory, 3 fish-glue factories, 1 boot-and-shoe manufactory, several oil-clothing establishments, etc. There is a daily and weekly newspaper. The horse-car tracks extend to East Gloucester, and other extensions are soon to be made. The town has an extensive foreign commerce, mostly with the Provinces, and imports salt from Trapani, which is used largely in the fisheries. For the year ending Oct. 1, 1887, there were 17 vessels of an aggregate tonnage of 1,137-67 tons lost from this port, together with 123 men, leaving 25 widows and 59 fatherless children.

Grand Rapids, a city of Michigan, at the head of navigation on Grand river, thirty-two miles from Lake Michigan. It is the county-seat of Kent County. Nine railroad lines have their termini in or pass through the city, and prior to Jan. 1, 1887, \$250,000 had been invested in real estate requisite for the erection of a \$500,000 union depot. Two systems of street-railway, with nearly thirty miles of track, one of them a cable-road, connect the outlying districts with the factories and business center of the city. The State Soldiers' Home is one mile north of the city, on the river-bank, and the State Masonic Home, one mile east of the city, on Reed's Lake, a beautiful sheet of water, a favorite summer resort, especially since its selection as the regatta course of the Northwestern Regatta Association. Two raceways, one on either side of the river, furnish water-power for a score of factories and mills. The chief industries are furniture, pianos, flour, mill-machinery, carpet-sweepers, felt boots, leather, beer, bricks, plaster, stucco, wagons, carriages, sleighs, staves, brushes, wooden ware, clothes-pins, soap, barrels, coffins, and electric supplies. The value of manufactured products for 1887 was about \$45,000,000, and the business of its wholesale and jobbing houses about \$20,000,000. The city has a public library, a free law library, two electric-light, two water, and one gas company, twenty-three public schools, five national and two savings banks, with \$2,800,000 capital stock and \$5,500,000 deposits; sixty churches, ten private schools, thirty-five publications, and many benevolent and social organizations. The population in 1870 was 16,000; in 1880, 33,000; in 1884, 42,000. A new city hall, costing \$300,000, was completed in 1887, and a site purchased for a \$200,000 building for a county court-house and other county offices. The completion of several railroad lines has materially aided the rapid growth of the city during the past few years.

Hamilton, the second city, in respect of population, in the province of Ontario, Canada. It is beautifully situated on the southern shore of Hamilton Bay, the westerly arm of Lake Ontario, forty miles from Toronto and forty-three

miles from Suspension Bridge. The population in 1861 was 19,096; in 1871, 26,716; in 1881, 35,961; and in October, 1887, 51,884. Three railroads enter the city, and two more, the Ontario Southern and Niagara Central, are in course of construction. A new building for a custom-house and post-office has recently been erected, together with several fine new schools. A new city hall is also being built. The chief manufactures are stoves, bridges, tools, agricultural implements, nails, boots and shoes, furniture, tobacco and cigars, carriage wood-work, engines and boilers, locomotives, hats, clothing, clocks, and glassware. It is the trade-center of the great fruit-growing district of Niagara, and fruit and vegetables are largely canned here. Hamilton does a large wholesale trade in groceries and clothing. The city is rapidly growing, and being admirably situated in respect of railroad and water communication, finds favor in the eyes of manufacturers. Hamilton beach, a narrow strip of land that separates the bay from Lake Ontario, is a noted summer resort, and is called the "Long Branch of Canada."

Hudson, a city of Columbia County, N. Y., on the eastern bank of Hudson river, 28 miles below Albany. It is on the line of the Hudson River Railroad, and is the terminus of the Chatham and Hudson branch of the Boston and Albany Railroad. During the navigation season four lines of steamboats touch daily each way. It was the third city incorporated in the State, receiving its charter April 2, 1785. In 1790 it was made a port of entry, and at that time had more shipping-tonnage than New York city, chiefly whalers. The population in 1880 was 8,670; it now (1888) exceeds 10,000. The city is one mile square, surrounded by thickly-settled villages and a rich farming and fruit growing country. The principal business is manufacturing and produce-shipping. Within the past six years four large knitting-mills have been erected. Among the other manufacturing industries are iron furnaces, steam fire-engines, paper car-wheels, bridge-works, planing-mills, sash-and-blind factory, box factories, etc. The city has one of the most perfect systems of water-supply in the State, the Hudson river being its source. A fine high-school building has just been completed at a cost of \$30,000. Although the city for half a century advanced but little in population or business, it has taken a fresh start within the past ten years, and is now rapidly increasing.

Indianapolis, the capital of the State of Indiana, and the county-seat of Marion County, on the west fork of White river, almost exactly in the center of the State. Its population in 1870 was 48,244; in 1880, 75,056; and in 1887 was estimated at 110,000. It is the terminus of fifteen railways, and within a radius of two hundred miles has more railways and telegraph lines than any city of its size in the world. The most recently constructed roads are the Indian-

apolis, Decatur, and Western and the Louisville, New Albany, and Chicago. Its railroad facilities give it great advantage as a distributing center, and the Belt railroad system handles half of the 4,000 cars used daily, outside the city. All parts of the city are connected by a street-railway transfer system, and several cable-lines connecting suburbs are projected. The erection of a new State house, after ten years' labor, and at a cost of \$2,000,000, and the Union Passenger Station, at a cost of \$250,000, indicate the recent growth of the city. The development of natural-gas fields in close proximity to the city has given manufacturing interests a prodigious impetus, and numerous concerns, employing millions of dollars of capital and thousands of persons, will probably move from other cities to Indianapolis if facilities for using the gas are effected. The tax duplicates show the value of the real and personal property to be in excess of \$50,000,000. The amount of capital invested in manufacturing is \$16,000,000, employment is given to 15,000 persons, and annually \$30,000,000 worth of goods is produced. The principal manufacturing interest is that of iron goods; but upholstered goods and furniture are also extensively manufactured. The grain-trade is mainly the growth of the past ten years, and the several elevators have an aggregate capacity of 1,000,000 bushels. The stock-yards have also been a recent growth, and transact a business of great magnitude. They have a capacity of 4,000 head of cattle and 85,000 hogs and sheep. The receipts annually are: Hogs, 1,068,387; cattle, 961,698; sheep, 120,389; horses, 16,158. Half of these receipts are consumed by local packers.

Kingston, the shire town of Ulster County, N. Y., the tide-water terminus of the Delaware and Hudson Canal, the eastern terminus of the Ulster and Delaware Railroad, and the northern terminus of the Wallkill Valley Railroad. It is picturesquely situated at the foot of the Catskill mountains, on the west bank of Hudson river, 88 miles north of New York and 54 miles south of Albany. The West Shore Railroad passes through the city, which is a point of departure for the Catskills and the Stony Clove Notch. The streets are wide, well paved, and lighted by electricity and gas. The abundant water-supply is brought by gravity from the Catskills, seven miles distant. Horse-cars and a cheap cab system connect the most distant points of the place. The city is bounded by Esopus creek on the north, the Hudson on the east, and the Rondout on the south, and next to Albany is the most important shipping-point on the Hudson. The principal shipments are coal, cement, brick, blue-stone, ice, lime, hoops, hides, woodenware, butter, milk, and fruit. Boat-building is carried on extensively, and large manufacturing interests are being established. The value of bluestone shipped in 1887 was \$2,000,000, and 60,000,000 bricks were manufactured and

shipped between the opening and close of navigation in 1887, and during the same period between 2,000,000 and 3,000,000 barrels of hydraulic cement were shipped. A new city hall has recently been erected. Kingston Academy, founded in 1784, Ulster Academy, Hillside Seminary, and several public schools are crowded with pupils. Nearly 500 buildings, principally private residences, have been erected since Jan. 1, 1887.

Knoxville, the third city in size in Tennessee, on the Tennessee river, in the center of the famous fertile valley of East Tennessee, 250 miles east of Nashville. The population in 1880 was 9,639; in August, 1887, by actual enumeration, it was 37,026. Since that time the population has increased at the rate of 1,000 a month, owing to the development of coal and iron mines, opening of marble quarries, erection of large manufactories, and the building of new railroads. In August, 1887, the city of Knoxville voted \$500,000 to the stock of two new railroads—one, the Powell's Valley, to the Cumberland Gap coal-fields, where is found the finest coking coal; and the other the Knoxville Southern, southward through exhaustless beds of magnetic iron-ore. In October, 1887, the city voted another \$100,000 to the stock of the Carolina, Knoxville, and Western Railroad, a line from Knoxville to the sea at Port Royal. Railroads now come into Knoxville from eight directions, and the city is connected with all the railroad systems of the South. Knoxville is one of the principal wholesale trade-centers of the South, having an annual business of \$36,000,000. In 1880 the capital invested in manufacturing was \$886,900, employing 881 hands. In 1887 the amount of capital in manufacturing was \$5,783,000, and the number of hands employed 5,786. The principal manufactories are iron-mills, marble-mills, zinc-works, lumber-mills, cotton-mills, woolen-mills, car-wheel foundries, car-factories, soap-factories, furniture-factories, tanneries, stove-foundries, and wagon-factories. In all, Knoxville has 150 manufacturing establishments. In 1886 a new court-house was completed at a cost of \$200,000; also the East Tennessee Hospital for the Insane, at a cost of \$275,000, an opera-house costing \$60,000, and a public library costing \$50,000. The United States Custom-House and Post-Office is built of East Tennessee marble, and cost \$500,000.

Los Angeles, the county-seat of Los Angeles County, Cal., on the Los Angeles river, 482 miles from San Francisco, 13 miles from the ocean. The population in 1870 was 8,000; in 1880, 11,183; in 1887, estimated at 70,000. Six railroads have their terminal points in the city, besides several motor-roads, which run from five to fifteen miles into the suburban districts. Several other lines are making Los Angeles their objective point. Horse-car tracks are laid in the principal streets, and there are also two cable-roads and two electric

roads, with several others building. Work has been begun on a complete system of cable-roads, to cost \$1,500,000, which will be the most extensive possessed by any city in the world. Congress has appropriated \$150,000 for a public building, the site of which has been purchased; \$200,000 has been voted for a new court-house, work on which is begun; a new jail, costing \$23,000, has just been completed, and work on a city hall, to cost \$185,000, is well under way. At present (December, 1887), 1,200 houses are in course of erection within the city limits, many of them large blocks. The main streets are paved with granite blocks and asphaltum. The city has been lighted by electricity for five years. Water is supplied by three systems, all drawing from the river. There are 11 banks, with over \$5,000,000 resources. The city has 6 parks. The headquarters of the Arizona military district are here. The public-school system is complete, and there is also a university. The exports of produce by rail from Los Angeles amounted last year to 79,158,407 pounds. The chief articles of export are citrus fruits, deciduous fruits (dried and green), raisins, wine, brandy, and wool. There were imported, by way of San Pedro, 125,543,000 feet of lumber and 118,536 tons of coal. The chief resource of Los Angeles consists in its climate and soil. The growth of citrus fruits, though still in its infancy, has assumed large proportions, and is constantly increasing. Almost every known agricultural and horticultural product can be grown in the Los Angeles valley. The health-giving climate, which is mild and salubrious all the year round, is attracting thousands of people from the East, who make their homes here. Costly and tasteful residences, embowered in orange-groves, are being built in every direction. Petroleum is found in great abundance, at convenient distances from the city. There are 5 foundries and iron-works, and the manufacture of iron water-pipe employs 10 establishments. There are 2 flouring-mills, 10 wineries, 8 distilleries, several canneries and fruit-evaporating works, 5 planing-mills, and a number of smaller manufacturing establishments. The city assessment for 1887 amounts to \$41,696,812, against \$16,432,435 for the previous year.

Lynchburg, the principal inland city of Virginia, on James river, 150 miles above Richmond, 174 miles by rail south-by-west of Washington, D. C. According to the revised census of 1880, the population of the city proper was 15,959, of which number 7,485 were whites and 8,474 negroes. Three lines of railroad cross at this point, and ground has been broken for a fourth, to connect the city with Durham, N. C., and place it within reach of a section famous for fine, bright tobaccos. Besides many handsome residences and business-houses, a custom-house is being built by the United States Government. The city is liberally provided with public-school buildings for both

racess; and there is a handsome orphan asylum, endowed by the late Samuel Miller with \$350,000 besides real estate. Ample water-power is furnished by James river, which is 600 feet wide and has an average depth of 4 feet, a series of dams in and above the city affording a fall of 20 feet. The principal trade and manufacture of the city is tobacco, of which the sales in 1871 aggregated 17,425,589 lbs.; in 1886 they amounted to 49,332,050 lbs. unmanufactured leaf. Of this latter amount, 21,710,723 lbs. were exported, and the remaining 27,621,327 lbs. were manufactured in the city for home markets. There are 25 factories engaged in making chewing-tobacco, 9 making smoking-tobacco, 3 making cigarettes, 1 making snuff, 1 making tobacco-extract, and 1 making tobacco-fertilizer; besides 6 warehouses, 1 storage-warehouse, manufactures of boxes, machinery, etc. In 1868 the total values of the city in real, personal, and mixed property were \$3,264,705, which in 1883 had increased to \$12,695,874. The total bank-capital, surplus, and deposits had increased during the same period from \$587,811.82 to \$8,428,078.17. A growing industry is the manufacture of iron of all kinds, from native ores, which is represented by three furnace and rolling-mill companies. The city is well supplied with water, lighted by electricity, and traversed on its principal thoroughfares by street-car lines. Within the past five years several large wholesale houses have been opened in various lines of goods, and have met with most encouraging experience in building up a southern and local trade.

Manitou, a summer resort in El Paso County, Col., eighty miles south of Denver, and six miles from the Harvard Observatory, on the summit of Pike's Peak. The town contains 10 large hotels, 3 stone railroad station-houses, and a very large bath-house for mineral-water bathing. The streets and buildings are lighted by electricity. The chief natural attractions about Manitou are the "Garden of the Gods," Cheyenne and Manitou cañons, the "Cave of the Winds," "Grand Caverns," Rainbow Falls, Ute Pass, "Glen Eyrie," and Pike's Peak. The summit of Pike's Peak may be reached by trail from Manitou in four hours. There are 9 cold mineral springs at Manitou, 6 effervescent soda and 3 iron. The Navajo soda-spring flows 6,000,000 gallons annually. This water and the iron-waters are bottled for the market. Capital employed, \$75,000. Manitou may be reached by rail from Denver or Pueblo. During 1887 two electric plants were put in operation in the town, a new railroad connection was made, a new stone city hall was built, and water-works with four miles of iron mains. The number of visitors in 1887 was estimated at 70,000. The industries are lime and stone quarrying. The present population is 1,050.

Montreal, the metropolis and chief port of the Dominion of Canada, on the island of Montreal, in the Province of Quebec, in lati-

tude 45° 31' north, longitude 73° 35' west, at the head of ocean navigation, on the river St. Lawrence, and near the junction of that river with the Ottawa. The population, which, according to the Government census of 1880, was 140,747, is now, according to a civic census taken in 1887, 191,000, the increase being partly due to the annexation of suburban municipalities. About three fifths of the inhabitants are French Canadians, and the remainder are chiefly of British extraction. The most important public work undertaken for the benefit of Montreal is the deepening of the ship-channel between that port and Quebec. This work, begun in 1851, at which time no ships drawing more than eleven feet could pass through Lake St. Peter, was completed in 1887; the channel now being deepened to 27½ feet. This port is also the termination of the St. Lawrence system of canals. The completion in 1886 of the Canadian Pacific Railway has given a great impetus to the development of Montreal, which was already an important railway center. The boot and shoe, the tobacco, and the cotton factories, and the locomotive and car building works, are among the chief industries. At present building operations are going on at an unprecedented rate. In 1878 the assessed value of real estate in the city was \$63,561,150; in 1885 it was \$90,220,475. Among the most conspicuous architectural additions in recent years are the City Hall, the Windsor Hotel, and St. Peter's (Roman Catholic) Cathedral. The latter building, which is approaching completion, is closely modeled after St. Peter's at Rome. A fine drill hall has recently been erected. The Canadian Pacific Railway has constructed a new cantilever bridge across the St. Lawrence at Lachine, near Montreal, and a grain-elevator in the harbor. Fine terminal stations are also in course of erection for the Grand Trunk and Canadian Pacific Railways. The universities of McGill College and Laval, and the schools of medicine of the universities of Bishop's College and Victoria, make Montreal the chief educational center of the Dominion. Laval University is now erecting a college which will be one of the finest buildings in Canada. Mount Royal was converted into a public park in 1874, the natural appearance of the mountain being preserved as much as is consistent with the convenience of visitors. Large sums have been spent in the construction of the roads. The commerce of the port is seriously affected by the annual closing of navigation. The last vessel generally leaves for sea between November 20 and the end of the month, and the first vessel from sea generally arrives about the end of April. During the season of 1885 there arrived 629 sea-going vessels, of 688,854 tonnage, and 5,003 inland vessels, of 724,975 tons. In 1875 the number of sea-going vessels was larger, 642, but the tonnage was less, 886,112. The number of inland vessels in 1875 was 6,148, the tonnage 811,410. There

is a wide range of temperature in Montreal. In 1885, for instance, the maximum was 87° 1' on July 17, and the minimum 21° 3' below zero on January 22. Snow falls on about 85 days in the year, and the annual snowfall averages 122 inches. Montreal is most favorably situated for drainage, but maintains a somewhat high death-rate, partly through lack of sanitary education among the masses, and partly due to an abnormally high birth-rate among the French Canadians. A good system of main-sewers has lately been constructed, and Montreal was the first city on the continent to dispose of scavenging refuse and night-soil by cremation.

Newport, Campbell County, Ky., an incorporated city, on the south bank of the Ohio river, opposite Cincinnati, and immediately above the mouth of Licking river. The first settlement, where the city now stands, was made in 1791. The population in 1850 was 5,895; in 1860, 10,046; in 1870, 15,087; in 1880, 20,433; in 1887, about 27,000. The city is well laid out and handsomely built, on an elevated plane, rising somewhat as it recedes from the river. The many fine residences are embowered in trees. The suburbs, especially the district called the Highlands, a mile and a half from the center of the city, are noted for fine residences and picturesque grounds. Newport is largely occupied as a place of residence by persons whose business is in Cincinnati. The water-works, several miles above on the Ohio river, furnish an abundant supply of water remarkable for its purity and clearness. It is allowed to settle in immense reservoirs before it is run into the mains. The city is lighted with gas, and several fine roads radiate from it. Two large steam ferry-boats ply between Newport and Cincinnati; and there is also a magnificent iron bridge connecting the cities for ordinary travel, street-railways, and railroad trains. A new iron truss and pier bridge connects Newport and Covington, over which a street-railway passes through Covington to Cincinnati. A street-railway connects Newport and the suburban towns of Bellevue and Dayton. The Louisville, Cincinnati, and Lexington Railroad passes through, and the Elizabethtown, Lexington, and Big Sandy Railroad is now in process of construction through the city. There are four large and commodious school-houses and five smaller ones, one of which is devoted to the instruction of the colored children. Newport has a rolling-mill, employing 600 men; a nut and bolt works, employing 250; iron and pipe works, employing 500; stove-works, employing 150; a watch-case manufactory, with 750 employes, besides saw-mills, shoe-manufactories, and various other works. There are two national banks in the city, a United States arsenal and military post, and sixteen churches; a daily paper, a tri-weekly, and two weekly papers are published. The principal courts of the county are held in the fine new court-house.

Norristown, a borough and the county seat of Montgomery County, Pa., on Schuylkill river, seventeen miles by rail northwest of Philadelphia. It extends two miles along the left bank of the river, rising by a series of terraces to a height of 200 feet above the water. Its area is 2,300 acres. The population in 1870 was 10,758; in 1880, 13,063; in 1887, 18,786. The mortality, according to the census of 1880, was 12.74 per thousand. The town's funded debt is \$73,000. The value of its taxable real estate, etc., is \$7,551,541. Three railroads run through the borough, and two more at Bridgeport, on the opposite side of the Schuylkill, are of easy access. Two telegraph lines have offices in the town, and eighty telephones are in use. There are two street-railways with an aggregate trackage of seven miles, two electric-light companies, a board of trade with 800 members, and a land and improvement company. A project well under way contemplates the formation of a trust to provide capital for new manufactories brought to Norristown. All the streets are macadamized. The buildings are all of brick or stone, frame structures being prohibited in the thickly-settled parts of the town. In 1887 250 new dwellings were erected. The industries are varied: its 84 manufacturing establishments include 12 iron-works, 18 woolen, cotton, and carpet mills, 4 hosiery factories, 3 shirt factories, 5 flouring-mills, 5 brick-works, and a glass-works. The total number of persons employed in the town in manufactures is 3,511, and the total value of the property used for manufacturing purposes, \$3,013,000. Among the public institutions are two opera-houses, a large marble court-house, built in 1854, at a cost of \$150,000, 19 churches, a library of 2,300 volumes, and another of 6,000 volumes, 5 public schools, 372 business establishments, 7 building and loan associations, 45 secret, beneficial, and literary societies, 8 national banks, 1 private bank, and a trust, insurance, and safe-deposit company; 5 weekly and 8 daily papers are published. The Hospital for the Insane of the Eastern District of Pennsylvania is on high ground in the northern part of Norristown. The institution comprises twenty massive brick buildings, and has 1,600 patients. The water-supply of Norristown is obtained from the Schuylkill (at a point where the river is 800 feet wide) by means of submerged pipes. The reservoir, 194 feet above the surface of the river, has a capacity of 110,000,000 gallons, the daily pumping capacity of the water-works machinery being 2,500,000 gallons. Over 21 miles of distribution-pipe are laid. The built-up portion of Norristown has been doubled in size within the past ten years, the greatest changes occurring within the four years previous to 1888, during which street-railways were built, electric lights introduced, a board of trade established, and a general impetus given to manufacture. Its proximity to Philadelphia and the low price of commutation

tickets have combined to make it the home of many men whose business is conducted in Philadelphia.

Oakland, a city of Alameda County, Cal., on the eastern shore of San Francisco Bay. The population in 1870 was 10,500; in 1880, 34,555; and in 1887 was estimated at 70,000. It is connected with the interior of the State by the Southern Pacific Company's system of railroads and the Sacramento and San Joaquin rivers. On account of its harbor facilities it is admirably adapted for commercial and manufacturing purposes. Woolen and cotton fabrics, jute bags, flour, nails, glass-ware, agricultural implements, files, tacks, boots and shoes, and furniture form the principal manufactured products. Being a suburb of San Francisco, it is a city of schools, churches, and homes. The streets are well kept, and the city presents a pleasant appearance on account of its fine residences and grounds. The climate is remarkable for its uniformity. The mean maximum temperature for the decade ending in 1885 was 91°, and the mean lowest temperature for the same period, 32°. Delicate plants, as the heliotrope, fuchsia, and geraniums, thrive out of doors during the winter months. The city is well supplied with cable and horse cars, and communication is regularly maintained with San Francisco—eight miles distant—by a system of steam cars and ferries running at intervals of fifteen minutes.

Pasadena, a city of Los Angeles County, Cal. In 1883 the population was about 1,200; in January, 1888, it was estimated at 12,000. It has 10 miles of graded streets; 11 churches; one of the finest school-buildings in California; a free public library of 10,000 volumes in a fire-proof building that has also accommodations for natural history collections; 4 banks; good hotels; and many beautiful villa residences. Twelve railway trains arrive and depart daily. The newly incorporated Salt Lake and Los Angeles Railroad will soon enter the city through one of the wildest passes of the Sierra Madre mountains. There is an open trail from the city to the summit of the range, where a hotel is to be built 4,000 feet above sea-level. The city is surrounded by immense fruit-ranches, and manufactures large quantities of wine.

Pawtucket, a city of Rhode Island, incorporated in 1886, four miles north of Providence, and at the head of navigation on Pawtucket river. The population in 1885 was 19,030, and in 1887 a little over 23,000. Three lines of railroads pass through the city, and horse-car tracks were laid in the principal streets in 1886. Water was introduced in 1878, and the cost of the present water-works is \$1,333,000. In December, 1887, \$150,000 was voted for a new pumping station. In 1887 there were received at this port 150,000 tons of coal, 5,000,000 feet of lumber, 1,800,000 bricks, 11,000 casks of cement, 4,000 casks of lime, 6,000 feet of North river stone, 1,200 bales of cotton, 250 tons of

soda-ash, and 2,000,000 laths and shingles. Exported, 1,000 bales of cotton, 50 tons of scrap-iron, 110 tons of fertilizer, and 150 tons of bone. The industries are varied. There are over 600 establishments that employ labor, and the number of employes is about 15,000. The Conant Thread-Works, with a capital of \$2,000,000, employs 2,200 hands; the Dunnell Print-Works, 450 hands; the Union Wadding-Works, 250; and D. Goff & Son's plush and braid mill, 800. The total number of cotton and woollen industries is 28. The first cotton-manufacture in the United States was established in Pawtucket by Samuel Slater.

Portland, the chief city of Oregon, on the Willamette river, twelve miles above the confluence of that stream with the Columbia, and 120 miles from the ocean. Portland was founded in 1847. It is the chief commercial city of the vast region drained by the Columbia river and its tributaries, and is the depot of a large mineral country including extensive gold and silver mines. It is the center of a large inland (steamboat) navigation system, the terminus of three transcontinental railroads, and the center of the railroad system of the Pacific Northwest. Ships ascend the Columbia and Willamette rivers to Portland from the sea, and the shipments of grain, flour, lumber, salmon, and wool are very large. The direct exports by sea to foreign countries of the products of Oregon and Washington Territory from Portland reached in 1887 nearly \$20,000,000. The city does a wholesale and jobbing trade amounting to \$45,000,000 a year. It contains twenty-six churches; its public and other schools are attended by 9,000 children, and with its suburb, East Portland, which lies just opposite, across the Willamette river, it contains 45,000 inhabitants.

Quebec, a city on the left bank of St. Lawrence river, which here receives the St. Charles, 400 miles from the mouth, 180 miles northeast of Montreal. The population in 1871 was 59,699; in 1881, 62,446. Five railways connect Quebec and the provinces, three of which have their terminus in Levis, a town of 13,000 inhabitants on the south side of the St. Lawrence opposite the city, while the other two enter the city. Ferries cross the river every fifteen minutes in summer, and every half-hour in winter, when there is no ice-bridge. Horse cars run through the principal streets. There are a parliament and departmental building costing \$1,200,000, and a court-house costing \$800,000. Graving-docks, situated at St. Joseph's, three miles below Quebec on the south shore, costing \$500,000, have recently been built. A harbor is in course of construction which will cost \$4,000,000. The lumbering interests of this ancient port have fallen off 50 per cent. within the past ten years. The number of arrivals from sea in 1876 was 987, and the clearances 976; in 1886, 501 entered, and 484 cleared. The manufacture of boots and shoes has increased to a large extent of

late, and at present there are 18 factories employing 7,000 operatives, and 34 tanneries, employing 800. Capital to the amount of \$18,000,000 is invested in these two industries. Gas and electricity have to some extent been substituted for steam-power. The city was lighted by electricity in 1887. The Quebec and Charlevoix Railway is in course of construction.

Quincy, the capital of Adams County, Ill., and the second city in size in the State. It is on a limestone bluff 180 feet high, on the eastern bank of the Mississippi, 160 miles north of St. Louis, and 264 miles south of Chicago. The streets are regularly laid out, three miles in length from north to south, and two and three quarter miles from east to west. In the business portion they are well paved and have numerous fine business blocks. In the residence portion many of the streets are bordered on each side by stately shade-trees. Handsome residences are numerous, surrounded by large, well-kept lawns. The streets are lighted by electricity. Water is supplied through 25 miles of mains from a reservoir with a capacity of 20,000,000 gallons at an elevation of 229 feet, giving an average pressure in the city of 40 pounds. The reservoir is supplied by two pumps $2\frac{1}{2}$ miles from the reservoir, which draw their water from the channel of the Mississippi. Six miles of street-car line traverse the streets. The population, by the census of 1880, was 27,800. The present population is estimated at 37,000, about 7,000 of which are foreigners, the major part being Germans, and about 1,500 colored. Quincy has four parks, and two miles east of the city are the fair-grounds. Two miles north from the business center is the Illinois Soldier's and Sailor's Home, which has a fine wooded tract of 140 acres. This home, when completed according to present plans, will be one of the most beautiful in the country. The State has already appropriated \$606,500. Seventeen buildings are now completed and others are in course of construction. All the buildings are connected by a tunnel 2,500 feet long with a ventilating shaft 135 feet high. The total number of inmates is 509. The capacity when all the buildings are completed will be 1,000. Quincy has a fine court-house of stone, surrounded by a beautiful park built at a cost of \$300,000, a new Federal building just completed at a cost of \$280,000, and there are in course of construction a city hall which will cost \$100,000, and a hotel to cost \$140,000. The city has an extensive trade which it distributes by seven lines of railroad and the Mississippi river. The commercial interests are represented by 1,313 different firms with a capital of \$10,800,500. The more important manufactures are 6 stove-foundries with a capital of \$1,000,000; 6 machine-shops, capital \$300,000; 5 carriage and wagon factories, capital \$400,000; 5 flouring-mills, capital \$400,000; 9 ice-houses, capital \$450,000; 27 cigar-manufactories, capital \$500,-

000; 8 chewing-tobacco factories, capital \$250,000; and 6 breweries, capital \$300,000. Besides these there is a large paper-board mill, with a capital of \$250,000, and the Gardner Steam Governor Works, capital \$200,000. There are also manufactories of furniture, plows, plug tobacco, organs, soap, files, and matches, and planing and saw mills, giving employment to over 4,000 persons. Quincy has 9 public schools, 13 parochial schools, 2 literary, and 1 medical college. There is a free library and reading-room association which has over 6,000 volumes, and is erecting a building to cost \$40,000. There are 32 churches, 2 hospitals, and 2 orphan asylums. There are published 5 daily newspapers, 8 weeklies, 1 bi-monthly, and 2 monthlies. Quincy was laid out in 1825, was organized as a city in 1839, and was the home of the first Governor of Illinois, Gov. Wood, to whose memory a bronze statue was erected in Washington Park in 1884.

Racine, a city on the west shore of Lake Michigan, in Racine County, Wis., at the mouth of Root river, which, with the government piers, makes a fine harbor. The city is 23 miles south of Milwaukee, and 62 miles north of Chicago. Two railroads and the lake afford excellent shipping facilities. It is on a plateau 40 feet above the lake-level, and 690 feet above sea-level. Racine was settled in 1836. The population in 1860 was 7,751; in 1870, 9,880; in 1880, 16,031; in 1885, 19,636; in 1887 estimated at 20,500. The valuation of real and personal property in 1887 was \$3,552,090. The indebtedness of the city was less than \$200,000. Manufacturing is the leading industry, employing 3,800 men and a capital of \$5,000,000, the annual products being valued at \$9,000,000. The principal articles made are thrashers, wagons, plows, harrows, fanning-mills, portable engines and boilers, and feed-cutters. The lumber and coal trade is large. The University of the Northwest is located here. The court-house and city hall are handsome structures, the latter completed in 1886 at a cost of \$62,000. A street-railway line connects the depot and traverses the principal streets. There are three national banks. A system of water-works is just completed, with a stand-pipe capacity of 330,480 gallons. Water is obtained from a distance of one and a quarter mile at the lake.

Saint John, a city and port of entry of New Brunswick, Canada, on the Bay of Fundy, at the mouth of St. John river, occupying both banks. Portland adjoins it to the north, and the two cities have a common harbor, and supply of gas and water. The population of St. John in 1871 was 28,805; in 1881, 26,127; the decrease being due to the great fire of 1877, by which half the city, including almost the entire business portion, was destroyed. By this Portland gained in population from 12,520 in 1871 to 15,226 in 1881. Since the fire, St. John has been rebuilt in a substantial manner. Three railways touch the city, and

street-cars have just been added. The port has a large trade, mainly with England and the United States. St. John owns more ships than any other port in Canada, the registry at the close of 1886 showing 635 sailing-ships and steamers of 216,959 tons. In 1866, apart from the coasting-trade, 1,899 vessels, of 501,527 tons, were cleared. The exports, chiefly lumber, for the year ended June 30, 1886, were \$3,901,495, and the imports \$4,075,062, the customs duties collected being \$861,002. The chief industries are lumber-mills, two cotton-mills, engine and car factories, nail-works, foundries, red-granite works, and a cordage-factory. The manufacture of lime is extensively carried on near the city, the product being largely shipped to the United States. St. John harbor, in which spring-tides have a rise of twenty-eight feet, has valuable fisheries of herring, shad, gaspereaux, and salmon. In 1886 was completed the fine steel cantilever railway-bridge across St. John river, a short distance above the city. St. John was incorporated by royal charter in 1785.

San Diego, a city and seaport of Southern California, the county-seat of San Diego County, 480 miles southeast of San Francisco. It is the Pacific terminus of the Atchison, Topeka, and Santa Fé Railway system. The present population (Jan. 1, 1888) is 80,000. In 1885 it was 4,000; in 1880, 2,637; in 1870, 2,300. Through railway connection with the Eastern States was established in 1885. Local lines connect the city with the interior of the county and with Los Angeles, San Bernardino, Riverside, and the principal Southern California towns. The Southern Pacific Railroad, connecting with the East as well as with San Francisco and Northern California and Oregon, is extending a branch from its main line to the city, and direct connection with Southern Nevada and Utah by another line will be made in the near future. The street-railroads, operated by electric, cable, and horse power, have an aggregate length of twenty-six miles, and the steam-motor railroads to suburban points have about thirty miles more. The city is lighted by electricity and gas. A complete sewer-system, embracing forty-seven and a half miles of pipe, is now being constructed. The ocean and coastwise traffic is considerable and is growing rapidly. It is the largest lumber-importing port, next to San Francisco, on the Pacific coast. The salubrious climate of San Diego, which possesses the most equable temperature of the coast, makes it a popular health-resort. The city has numerous fine hotels and several daily newspapers. There are four national banks and two State banks. Coronado Beach, on the opposite side of the bay, is a city in itself, with a hotel costing \$1,200,000, street-railways, electric lights, etc. Ferry service, with five-minute trips, connects the beach with the city proper. The water-supply of the city and Coronado Beach is obtained from the San Diego river, being pumped

to reservoirs on the heights north of the town, and piped throughout the city and under the bay to the beach. A company is now building a large flume from the head-waters of San Diego river and other mountain sources, which will be completed in a few months, and, besides supplying a large area with irrigating facilities before reaching the municipal limits, will increase the city's supply to an extent adequate to the requirements of a population of 200,000.

Sandusky, a city of Erie County, Ohio, and a port of entry on Lake Erie. The population, by the last school-census, is 22,500. The city is on the northern division of the Lake Shore and Michigan Southern Railroad, and is the Lake Erie terminus of the Indianapolis, Bloomington, and Western, the Baltimore and Ohio, the Lake Erie and Western, and the Sandusky, Ashland, and Ooshooton railways. Sandusky Bay is a landlocked harbor, eleven by three miles. It has the largest coastwise trade on the lakes, and is the largest fresh-water fish market in the world, its fish-business aggregating over \$1,500,000 yearly. Here are manufactured over 2,000,000 gallons of wine annually, Sandusky being in the heart of the grape section of Ohio. In fresh fruits—principally peaches, pears, and apples—its business has reached over \$1,000,000 in a year. It does a heavy trade in white and blue limestone and in lime, the country being underlaid with limestone. The Government locks at Sault Ste. Marie are built of Sandusky white limestone. Sandusky is largely engaged in the manufacture of carpenters' tools, and spokes, wheels, hubs, and buggy bodies, over 600 men being employed in these branches of manufacture. There are two large establishments, employing 350 men, turning out flouring-mill machinery, engines, boilers, and agricultural implements. There are four national banks. The streets are wide. The buildings, both private and public, are chiefly built of blue limestone. There are two establishments employing 250 men in the manufacture of tubs, pails, and fish-packages. The new Ohio State Soldiers' and Sailors' Home, to accommodate 1,500 men, is being built here. This institution is on the cottage plan, each cottage to accommodate fifty men, with central dining-hall, kitchen, laundry, bath-house, and administration building—in all, thirty-four buildings, of blue limestone and practically fire-proof, costing \$585,000, exclusive of the ninety acres of ground, which were given by the city. The cost of maintaining the home will be \$150,000 to \$160,000 a year. There are a central high-school, four ward-school buildings, and a half-dozen smaller ones. There are three Catholic, two Episcopal, one Presbyterian, Methodist, Baptist, and Congregational, and nine German Protestant churches. The court-house is new, built of bluestone. There is a complete system of water-works. The stand-pipe, built of steel-plates, is 180 feet high and 25 feet in diameter, with another

stand-pipe 225 feet by three, for fire-purposes. Lake Erie furnishes the water-supply. The city is thoroughly sewered. Four newspapers are published here.

San José [San Hoza'y], the county-seat of Santa Clara County, Cal., 47 miles south of San Francisco, 6 miles southeast of San Francisco Bay, 28 miles from the Pacific Ocean. With its suburbs, it numbers 25,000 inhabitants, and the assessed valuation of property within its corporate limits is \$12,000,000. San José is essentially a modern city, with broad streets, sidewalks of concrete and asphaltum, fine business buildings, and handsome residences. It is lighted mainly by electricity, has street-railroads, and an electric-motor road connects it with the town of Santa Clara, three miles distant. Three railroads connect this city with San Francisco, and two of these lines pass through the city to the Pacific Ocean. It is also connected by rail with the southern part of the State. The city owns two public parks, one containing 400 acres, six miles distant. This park is noted for its mineral-springs and its wild scenery. The State Normal School building, in the center of Washington Square of 28 acres, cost \$150,000, and has 700 pupils. The court-house is a massive Corinthian structure, costing \$200,000. The new city hall is a beautiful building, costing \$75,000. There are ten churches and eight large school-houses, each surrounded by spacious grounds. The college of Notre Dame (Roman Catholic), for young ladies, has a fine building and extensive grounds valued at \$600,000. There is a business college in the city. Between San José and Santa Clara is the University of the Pacific (Methodist), which owns sixteen acres and has five large buildings. The city has a public library of 7,000 volumes. Four daily and three weekly newspapers and a monthly periodical are published here. The city contains a woolen-mill, three foundries, three flouring-mills, three breweries, three distilleries, three fruit-canning establishments, two fruit-driers, two glove-factories, a silk-factory, three candy-factories, two furniture-factories, five carriage-factories, a tannery, a box-factory, several wineries, and various machine-shops, planing-mills, cigar-factories, etc. There are four banks, with a capital of \$2,500,000. San José is rapidly increasing in population and wealth. Its position, in close proximity to Mt. Hamilton, the site of the great Lick Observatory on the east, and to the \$20,000,000 Leland Stanford, Jr., University on the west, and its unrivaled climate, are great inducements for those looking for pleasant homes.

Schenectady, a city of Schenectady County, N. Y., in the Mohawk valley, on the New York Central Railroad, 17 miles west of Albany. Other railroads running into the city are the Troy and Schenectady, the Rensselaer and Saratoga, and the Delaware and Hudson Canal Company. The Erie Canal passes through the

city. Its important industries are: locomotive works, employing 1,200 men; the Westinghouse Agricultural Works; and the Edison Machine-Works, which removed to Schenectady in 1886. These works occupy extensive buildings and employ 1,000 men. The Gilbert Car-Works is also a recent and important industry. There are also several knitting-mills, a shawl-factory, hay-wire factories, and other minor factories and mills. The city is supplied with water from Mohawk river by its own system of water-works. The streets are lighted with electricity, as are also the public buildings and many of the stores and private dwellings. Horse-cars run upon the main street. Union College is located here. A new depot of fine design has been erected by the New York Central Railroad, and a city hall has been built and given to the city by one of its residents. The city is very compactly built, and in the old part may still be found many traces of its Dutch origin. The population in 1880 was 18,675. Since that time its growth and improvement have been more marked than in any other period of its history, and its population is now estimated at 20,000.

Sherbrooke, a city of the province of Quebec, Canada, on the rivers Magog and St. Francis. It is the capital of the Eastern Townships, the designation given to that part of the province which lies south of the river St. Lawrence. It is 101 miles east of Montreal, and 121 miles southwest of Quebec. The population, about 9,000, is composed of English and French speaking races, the French largely predominating. It is the terminus of the International, Passumpsic, Waterloo and Magog, and Quebec Central Railways, and is connected both east and west by the Grand Trunk Railway. A new connection will shortly be made by the extension of the Canadian Pacific Railway through the city to the maritime provinces. Sherbrooke possesses magnificent water-power, derived from the fall of the river Magog, which here descends 120 feet, within half a mile, to the St. Francis. The city is the seat of a Roman Catholic bishop, and contains a cathedral and bishop's palace and two district churches of the same denomination, 2 Anglican churches, 1 Methodist, 1 Presbyterian, and 1 Congregational, and a Baptist church will soon be erected. All criminal and civic cases within the district of St. Francis are tried here. The main industry is the manufacture of woollen goods, one firm alone employing between 500 and 600 people and paying out annually in wages over \$140,000. There are also saw-mills, iron-foundries, machine-shops, snath, bobbin, corset, and other factories. There are 18 hotels and 4 newspapers, two English and two French. The public schools are under the direction of two boards of trustees, one Protestant and the other Roman Catholic. There is a large Roman Catholic hospital here, and the land has been purchased for a similar institution by the Protestants. The export trade to

the United States is considerable, the entries made through the United States consulate amounting to about \$1,000,000 a year, principally lumber, pulp, asbestos, and live-stock. The city is well supplied with gas and water, is the center of a good agricultural district, and is growing rapidly.

Stockton, the county-seat of San Joaquin County, Cal., on an arm of San Joaquin river, three miles from the main stream. It is 92 miles from San Francisco by rail, and 120 by water. Horse-car tracks are laid in the principal streets, and an electric-motor railroad will soon be in operation. A new agricultural pavilion, costing \$60,000, was completed in September, 1887, and is the finest structure of its kind west of the Rocky Mountains. A granite court-house is in process of erection at a contract price of about \$300,000. Stockton is emphatically a city of churches, the following denominations being represented by commodious and well-built edifices: Roman Catholic, 1; Episcopal, 1; Congregational, 2; Baptist, 2; Methodist Episcopal, 2; Methodist Episcopal (South), 1; Lutheran, 1; Presbyterian, 1; Cumberland Presbyterian, 1; German Reformed, 1; German Methodist, 1; Latter-Day Saints, 1; Christian, 1. The public schools are as good as any in the State, and the graduates of the high-school are admitted to the State University on the recommendation of the principal without examination. Stockton is one of the leading wheat-markets of the Pacific coast, and there are warehouses here having an aggregate capacity of over 100,000 tons. It is the natural commercial center of a fine agricultural district. Among the numerous manufactures are two flouring-mills, each having a daily capacity of 1,500 bbls., two combined harvester-works, a wheel-and-axle factory, a paper-mill, a woollen-mill, two carriage-factories, three foundries, and several planing mills. The population in 1880 was 10,287. In 1887 it was estimated at 18,000.

Toronto, a city, port of entry, and the capital of Ontario, Canada, county-seat of York County, on the north shore of Lake Ontario, 810 miles southwest of Montreal, and 528 miles northwest of New York. Latitude, 43° 39' north; longitude, 79° 21' west. Population in 1861, 44,821; 1871, 56,092; 1881, 77,034; 1886, 111,800; 1887, 118,408. The bay south of the city is formed by an island, and is about three miles long and two miles wide. The river Don, which falls into the bay on the east, is now being straightened and made navigable, so that it will form part of the harbor, at an expenditure of over \$300,000. The corporation limits, which have been much extended by annexation of late, include 9,858 acres, or 15½ square miles, as compared with 5,000 acres in 1871. The assessed value of real and personal property (not counting stocks in public companies) in 1875 was about \$46,000,000; in 1885, \$65,119,702; in 1886, \$68,377,508; in 1887, \$78,288,226; in 1888 (estimated), \$98,-

889,754. The taxes in 1874 yielded \$608,475. In 1886 the total revenue was \$1,595,550, of which taxation at the rate of 16½ mills contributed \$1,184,958. The imports for 1885-'86 valued \$18,801,177, of which \$7,832,156 were from the United States. The exports for the same year, as officially reported, were \$3,085,800, of which \$2,189,414 went to the United States. The value of manufactures, according to the census of 1881, was \$19,100,116, the chief items being boots and shoes, furniture, clothes, whisky, and ale. The amount of capital invested is \$11,502,310; the number of hands employed, 12,708; the amount of yearly wages, \$3,721,861. The total failures in To-

annually by a vote of the rate-payers. The city has a fire-alarm telegraph, telephonic system, paid fire-department, and street-railways. The water-work system is owned by the city; the revenue of this department in 1886 was \$315,227, and the expenditure \$196,495, exclusive of payments made on account of water-works' debt; the amount of the indebtedness of the department is \$2,580,205, exclusive of \$350,000 which the city has just decided (1887) to expend in improving the system. Surveys are being made at present with a view to securing water by a system of gravitation from lakes to the north of the city; this scheme, if carried out, will cost \$5,000,000 or \$6,000,000.

BRANCH OF MONTREAL BANK, TORONTO.

ronto in 1886 were 86, with estimated liabilities of \$1,048,509 and assets of \$528,859. The total number of letters delivered from the Toronto post-office in 1886 was 9,776,509, besides 2,592,880 newspapers; the total number of letters, books, post-cards, circulars, etc., posted at Toronto in the same year was 21,024,824. There are ten banks having headquarters in this city, and branches of four Quebec and Montreal banks. The branches of the Montreal Bank and Quebec Bank have recently erected new and handsome buildings; that of the first-named institution is one of the most complete and thoroughly equipped bank-buildings in the Dominion. The city is divided into twelve wards, each of which elects three aldermen and two school trustees. The aldermen are vested with legislative and executive powers, and can act as magistrates if possessed of legal property qualification. The mayor is elected

The city is abundantly supplied with educational institutions, many of which form also the principal public buildings. The University of Toronto, erected in 1827 for \$900,000, is controlled by the Ontario Government, and has been conducted hitherto at a cost of about \$18,000 annually. By an act passed at the last session of the Ontario Legislature it was arranged to federate with Toronto University Victoria University, Cobourg, a Methodist institution, as the first step in a contemplated complete scheme of university federation for the province. At the same time it was decided to establish a medical faculty in connection with the university. In consequence of the proposed extension of this institution by federation, the endowment will be increased from \$78,000 to \$100,000, \$15,000 of the increase to come from the endowment fund of the Upper Canada College, another institution under

the control of the Provincial Government; the college site is to be sold, and a new building to be erected for \$100,000 of the proceeds, the remainder going to further swell the university endowment. Trinity University is an Anglican institution established in 1852, having about 60 resident and non-resident students, and a handsome building. McMaster Hall is a Baptist college, which in 1887 was converted into a university and received a bequest of \$800,000 from the late Senator McMaster. Besides these universities there are in the city a Presbyterian college (Knox), an Anglican college (Wycliffe), Trinity Medical School, with 800 students; Woman's Medical College, College of Pharmacy, College of Physicians and Surgeons, Royal College of Dental Surgeons of Ontario, Veterinary College, etc. There are thirty public schools in the city, the total expenditure on their account in 1886 being \$245,957, including \$57,000 for new buildings; there are also sixteen separate schools, or Roman Catholic institutions, and several other institutions for higher education, both undenominational and Roman Catholic. The city has numerous charitable and benevolent institutions, including the Insane Asylum and the General Hospital, having a capacity respectively of 700 and 400. There are 26 organized and thoroughly equipped institutions of this nature. At the 1886-'87 session of the Ontario Legislature, the sum of \$1,050,000 was appropriated for the erection of new legislative buildings in Queen's Park; they will be constructed of Credit valley red sandstone, in Neo-Greek architecture. The buildings were commenced in 1886. Plans are being prepared also for a combined police headquarters, court-house, and city-hall building, for which the City Council has appropriated \$400,000. Construction will be commenced in 1888. A public library was opened March 6, 1884, and was considerably enlarged in 1887; it covers the ground-floor of a not very handsome building at the corner of Church and Adelaide Streets, and contained in 1887 about 48,000 volumes. There are several other libraries, free to the public with certain restrictions, chief among which are the Parliamentary and the Osgoode Hall. Other public buildings are Osgoode Hall, the seat of the principal law and equity courts of the province; Government House, the residence of the Lieutenant-Governor of Ontario; the customs house and the post-office; the Grand Opera-House and Jacobs' and Shaw's Opera-House, each having a capacity of about 1,500; the Central Prison; School of Practical Science; the Observatory; the Normal School buildings, the present city hall, court-house, police and legislative buildings. There are 105 churches in the city, exclusive of several organized congregations worshipping in public and other halls. The principal buildings are St. James's Cathedral (Anglican), costing \$220,000, and having a spire of 316 feet; the Metropolitan (Methodist),

costing \$100,000; St. Michael's Cathedral (Roman Catholic); St. Andrew's West (Presbyterian); and Jarvis Street Baptist Church. New and handsome churches are now being erected in every quarter of the city. There are three morning newspapers and three evening newspapers issued, besides sixty-three weekly, monthly, and quarterly publications, many of which are religious journals. The railway connections of the city are the Ontario divisions of the Canadian Pacific Railway, being the Credit Valley, the Toronto, Gray, and Bruce, and the Ontario and Quebec sections; the Grand Trunk, Midland, and Northern and Northwestern; and the Erie and Huron. There are two telegraph companies, the Canadian Pacific and the Great Northwestern of Canada; and one telephone company, the Bell. Toronto was founded in 1794 by Governor Simcoe, and became and remained until 1841 the seat of Government for Upper Canada. It bore the name of York until 1884, when it was incorporated as the city of Toronto. From 1849 to 1858 it alternated with Quebec as the seat of the united government, and at confederation (1867) became permanent capital of Ontario.

Trenton, the capital of New Jersey, at the head of navigation on Delaware river, on the main line of the Pennsylvania Railroad, 33 miles from Philadelphia, and 57 miles from New York. Its population by the State census of 1885 was 34,386; but this does not include the suburban municipalities of Chambersburg and Millham, which are mere outgrowths of the city, and would increase its population to over 50,000. Trenton is the seat of the largest pottery industry in the United States, of a large and rapidly growing rubber-manufacturing interest, rolling-mills, wire-rope works, woolen-mills, anvil-works, and a variety of other important industries. One of the largest and handsomest theatres in the country has lately been finished. There are two horse-railroad companies, with about ten miles of track. The Pennsylvania Railroad, the Belvidere Delaware Railroad, the Bound Brook Railroad, and the old Camden and Amboy Railroad, radiate from the city. It is also intersected by the Delaware and Raritan canal, which has several large basins in the city. There are two lines of steam-propellers. The water-supply is one of the best in the country. The works are owned by the city, and the rates are very low. The city is surrounded by a rich and beautiful agricultural country. The climate is salubrious, and the death-rate is only 16 in 1,000. Several miles of streets are paved with Belgian block, asphalt, and Telford. The capital invested in manufactures aggregates about \$10,000,000, mainly in pottery, iron and steel, rubber, brick, and woolen goods.

Tucson, a city of Arizona, on Santa Cruz river, in the southeastern part of the Territory, and on the line of the Southern Pacific Rail-

road. It is 60 miles from the border of Mexico, and about 175 miles from the Gulf of California. In 1884 it had about 10,000 inhabitants, and in 1887 about 7,500. It is the county-seat of Pima County, and has the most expensive court-house in the Territory. It has a fine, large brick school-house, erected at a cost of \$50,000, and there are now in course of erection a very large Catholic church, hospital, and convent, and a Territorial university. Congregationalists, Baptists, and Methodists have each a fine church-building. There are no manufactories, but arrangements for a tannery are being made. A root found in very large quantities in the surrounding country contains 96 per cent. of tannic acid. Two new railroads have been projected, one of which is now in course of construction. There are several large irrigating ditches in course of construction in the immediate neighborhood of this city, which, when finished, will place many thousands of acres under cultivation that are now of no value whatever. Tucson has gas-works, ice-works, and water-works. Two daily papers are published here, and one weekly in the Spanish language.

Virginia City, the largest town in Nevada, in Storey County, in the western part of the State, on the eastern slope of Mount Davidson, 6,100 feet above the level of the sea. It is 52 miles by rail from Reno, on the Central Pacific Railroad, with which it is connected by the Virginia and Truckee Railroad, Virginia City being the southern terminus. The town grew rapidly for several years following the uncovering of immense bodies of ore in the Comstock lode, in 1868-'69. From 1875 the ore-yield was much less. Deep mining proved unprofitable, and many people sought their fortunes in other directions. Houses were taken down and removed to other localities, or burned for fire-wood. Large bodies of low-grade ore had been left in the haste of extracting that of more value, and it having been found that this can be milled with profit to the mining companies, fresh bodies of ore being also found near the surface, a new impetus has been given to the town within the past two years. No new buildings have been erected for ten or twelve years, owing to the causes mentioned. The town's prosperity depends wholly on the mines, there being no business except such as is connected with them, and the furnishing of supplies for the people. The production of the mines varies largely; in some years it has been as high as \$30,000,000, but it is now much less. It is supplied with water from Lake Marlette and its tributaries, distant 21 miles, by an extraordinary piece of hydraulic engineering, the flumes and pipes having been carried up and down the walls of 12 steep cañons, one of the depth of 1,540 feet. The town contains a fine court-house, school-houses, 5 churches, a few elegant private residences, and the largest and most complete hoisting-works over the mines that are to be found in the world. The

population is fluctuating, depending on the amount of milling and mining being done. In 1885 it was estimated at 10,000; but it is now, 1887, nearer 12,000.

Washington, the capital of the United States of America, in the District of Columbia, on the northeast bank of the Potomac river, 116½ miles above its mouth at Smith's Point, and 184½ miles from the Atlantic at the mouth of Chesapeake Bay, between the Anacostia or Eastern branch and Rock creek (which separates it from Georgetown on the west), 35 miles (direct) S. W. of Baltimore, and 205 miles S. W. of New York; latitude (Capitol) 88° 58' 20-1" N., longitude 77° 0' 27-9" W. of Greenwich; population in 1870, 109,199 (85,455 colored and 13,757 foreigners); in 1875, estimated at 133,000; in 1880, 159,855; in 1887, estimated at 179,000, of whom nearly one third are colored. It covers a little more than 9½ square miles. The site is an undulating tract having a mean altitude of about 40 feet above the river. Beyond the limits is a circling range of wooded hills. The streets, with the exception of those designated as avenues, are laid out at right angles, running due north and south, and east and west. The north and south streets are designated by numbers, the east and west by letters. The width of the streets varies from 70 to 160 feet. There are 21 avenues, named after States of the Union, crossing the streets diagonally, the principal of which radiate from the Capitol, the White House, or Lincoln Square east of the Capitol. Of these 19 are from 120 to 160 feet wide, and 2 are 85 feet wide. Pennsylvania Avenue, the great business thoroughfare, extending across the city from Rock creek to the Eastern branch, is interrupted by the Capitol and the White House, between which it forms the main avenue of communication. There are several squares handsomely laid out and containing fountains, trees, shrubbery, and statues of naval and military heroes. Among the most noteworthy are Farragut Square, between Sixteen-and-a-half and Seventeenth and I and K Streets, with a heroic statue in bronze by Vinnie Ream Hoxie; Lafayette Square, between Vermont Avenue and Sixteen-and-a-half Street and Pennsylvania Avenue and H Street, containing an equestrian statue of Gen. Jackson, designed by the late Clark Mills; Washington Circle, at the intersection of Twenty-third Street and Pennsylvania Avenue; McPherson Square, at the intersection of Vermont Avenue and I Street; Scott Circle, Sixteenth Street and Massachusetts Avenue; Thomas Circle, Fourteenth Street and Massachusetts Avenue, all of which contain statues of the men after which they are named. The Mall, extending west from the Capitol Grounds, contains the Botanic Garden, the Smithsonian Institution, and the Department of Agriculture. The "Park" extends west from the Mall to the banks of the Potomac, and contains the recently finished Washington Monument, 555 feet high, and the Government Propa-

gating Garden and Nursery. The Capitol is on the west brow of a plateau that forms the east portion of the city, and fronts the east. Its entire length is 751 feet 4 inches, and the greatest depth, including porticoes and steps, is 348 feet. Exclusive of court-yards, it covers a little over 8½ acres. The walls of the central building are of sandstone painted white; the extensions are of white marble slightly variegated with blue. Outwardly the Capitol has various architectural adornments, with several groups of sculptures; within it is profusely decorated with frescoes, sculptures, and paintings. From the center rises a cast-iron dome, 185½ feet in diameter, to a height of 287½ feet above the basement-floor of the building. The dome is surmounted by a bronze statue of Liberty by Crawford, 19½ feet high. The Capitol contains the Senate Chamber, the Hall of the House of Representatives, the Supreme Court, and Library of Congress. The Capitol Grounds comprise 51½ acres, handsomely laid out, and containing a great variety of trees. East of the Capitol is a colossal statue in marble of Washington, by Greenough. East of the Capitol Grounds is the site of the new Library of Congress, work on which was commenced in the summer of 1887. When completed it will be the largest building in the city except the Capitol, and will form a noble addition to the already numerous public buildings. The structure will cover 111,000 feet of space, 14,000 feet more than the British Museum Library. Its general architectural features will be in keeping with the Capitol, which it will face. The President's house, or Executive Mansion, is in the west part of the city, 1½ miles from the Capitol. It is 170 feet long and 86 feet deep, built of freestone, and painted white, from which circumstance it is popularly known as the "White House." The grounds comprise about 75 acres, of which about 20 are inclosed as the President's private grounds, are handsomely laid out, and contain a fountain. Other Government buildings are the Treasury Department, the recently completed edifice for the State, War, and Navy Departments, the Department of the Interior (containing the Patent-Office), the General Post-Office, and the Department of Justice and Court of Claims, all magnificent or imposing structures. In Judiciary Square is the Pension-Office, a big brick structure, completed in 1887 after designs by Gen. Meigs, U. S. Army, at a cost of \$900,000. The U. S. Naval Observatory (latitude 38° 53' 38" N., longitude 77° 3' 18" W.) occupies a commanding site on the bank of the Potomac in the west part of the city. By act of Congress the meridian of the Observatory is adopted as the American meridian for all astronomical purposes, and the meridian of Greenwich is adopted for all nautical purposes. The Army Medical Museum, the Ordnance Museum, and the Government Printing-Office are noteworthy. The Navy Yard is on the Anacostia. The Corcoran Art Gallery occu-

pies a fine building near the White House. The principal theatres are Albaugh's Opera-House and the National Theatre. The hotels of Washington are a prominent feature of the city. The principal are the Arlington, Ebbitt, Willard's, Riggs, Metropolitan, National, St. James, and St. Marc. There is a bridge across the Potomac known as the "Long" Bridge, for railroad and ordinary travel, and a free bridge at Georgetown built by the Government. Communication with the North is furnished by the Baltimore and Potomac Railroad; with the West by the Baltimore and Ohio and Pennsylvania; and with the South by the Alexandria and Washington, which crosses the Long Bridge, and the Richmond and Danville system. Washington and Georgetown are supplied with water from the great falls of the Potomac above by an aqueduct 12 miles long, which discharges into a distributing reservoir 2 miles from Rock creek and 4½ miles from the Capitol. Among the charitable institutions, many of which receive aid from the Government, are the Naval Hospital and the Washington Asylum, serving as an almshouse and work-house for the District. The Soldier's Home, 8 miles north of the Capitol and beyond the city limits, was established in 1851 for aged or disabled soldiers of the Regular Army. It occupies a beautiful site, and the grounds, comprising 500 acres, are handsomely laid out. The District Reform School for boys, with a farm of 150 acres, is northeast of the city. The Government Hospital for the Insane, with accommodations for 560 patients, is on the southeast bank of the Anacostia. It was opened in 1855, and is designed for the insane of the Army and Navy and the indigent insane of the District of Columbia. The Columbia Institution for the Deaf and Dumb, on the northeast border of the city, was chartered by Congress in 1857, and is designed for deaf-mute children of the District of Columbia, and those whose parents are in the Army or Navy. A collegiate department, the National Deaf-Mute College, was organized in 1864; it is open to students from all parts of the country. The public schools of Washington form part of the free-school system of the District. Separate accommodations are provided for colored children. Howard University is near the north border of the city, beyond the limits. Columbian University (Baptist), just northwest of the city, was incorporated as a college in 1821, and as a university in 1873. Its law and medical departments, the latter known as the National Medical College, are in the city. In 1875-'76 there were 12 instructors and 108 preparatory and 48 collegiate students. Near the Columbian University is Wayland Seminary, also under Baptist control, established in 1865 for the education of colored preachers and teachers. Gonzaga College, north of the Capitol, is under the control of the Jesuits. In the city are also the Law and Medical Departments of Georgetown College

the National College of Pharmacy, and the Law Department of the National University. The last is the only department organized of a proposed university incorporated in 1870. The Louise Home was established and endowed by W. W. Corcoran, in memory of his wife and daughter; only gentlewomen in reduced circumstances are eligible for admission. The permanent seat of the Federal Government was fixed on the Potomac by an act of Congress, passed July 16, 1790; in 1791 the site was selected by Washington, and commissioners were appointed to lay out the city. The Government was established here in 1800, Congress assembling on November 17. On Aug. 24, 1814, the British took possession of the city, and burned the public buildings. In July, 1864, when it was defended by a circle of forts, it was for a few days threatened by the Confederates. Washington was under municipal government from 1802 to 1871, when its corporate existence was merged in the government organized for the entire District; but the territory formerly within the corporate limits continues to be known as the city of Washington.

Wilmington, a city of Hanover County, N. C., on Cape Fear river, twenty miles from the sea. The population in 1850 was 7,264; in 1860, 9,552; in 1870, 13,446; in 1887, estimated at nearly 25,000. There are 2 banks, and a savings-bank just established; 2 successful building and loan associations; a real-estate and investment company; 39 churches, 28 benevolent societies, a large number of academies and schools, and a library association. There are 4 daily and 7 weekly newspapers, rice-mills, 4 steam saw- and planing-mills, turpentine distilleries, flouring-mills, an iron foundry, and sash and blind factories. There are 2 marine railways, with dry-docks 70 feet wide, with a keel support of 139 feet, which accommodate vessels of 1,000 tons. The capacity of the cotton-mills has been greatly increased during the past year. The Hanover Knitting-Mill, a new venture, turns out hosiery, plain and in colors. The Carolina Oil and Creosote Company have a plant valued at \$120,000, where annually from 5,000,000 to 7,000,000 feet of lumber are treated by a patent process. This is a method of extracting the sap and wood acids from lumber, and by a pressure of 125 pounds to the square inch forcing the hot creosoting oil into the open pores of the wood. This preserves the lumber from either the ravages of salt-water, insects, or from dry rot. The output of creosoting oil (extracted from the "fat" pine or "lightwood" of the old turpentine plantations) is 3,000 gallons daily. A new railroad 89½ miles long opens up a large territory to the trade of Wilmington. It runs from Ohadbourne, N. C., to Conway, S. C. The town of Crowley, N. C., near Wilmington, laid out and owned by a Wilmington firm, is the site of the Acme Fertilizer Factory and the Acme Pine-Fiber Factory, the latter manufact-

uring fiber from the hair or leaves of the pine-tree by a patent process, and from the fiber, carpets. The factories are in the center of a pine forest. The Navassa Guano Company's factory is just above the city. The United States Government has recently purchased a valuable site, and made an appropriation for a public building. The United States has also a Marine Hospital in Wilmington, Carolina Beach, a new watering-place, opened in 1887, is 15 miles below the city. It was patronized by 25,000 visitors the first season. The city is lighted by electricity, and supplied with water-works. It has 3 steam fire-engines, and 1 hook and ladder company, and a fire-alarm system. The value of exports was \$2,250,000 more for the fiscal year of 1886-'87 than for the previous year. The principal exports are cotton, naval stores, and lumber and shingles. Over 70,000 bushels of peanuts are handled annually.

Woburn, the most populous town in Middlesex County, Mass., near the upper end of Mystic valley, ten miles northwest of Boston, in the midst of rural surroundings as picturesque as any in New England. It is on the Boston and Lowell Railroad. In point of freight and passenger business this is the most important station between Boston and Lowell. There are two recently built and admirably equipped street-railway lines in the town. The population of Woburn in 1870 was 8,560; in 1880, 10,991; on May 1, 1887, 12,750. It is now growing faster than ever, and an application for a city charter will soon be made. In the past ten years it has grown to be the largest leather-manufacturing town or city in New England. In capital invested, men employed, and value of products, it leads all other places engaged in the same business. There are over thirty leather-making establishments here which give employment to more than 2,000 workmen, to whom is annually paid in wages over \$700,000. The capital invested in this industry is nearly \$4,000,000; value of annual products, \$6,000,000; cost of stock used, \$4,000,000. Besides leather-making, glue, chemicals, incandescent electric lamps, dynamos, tanners' machinery, steam-engines, and shoe-stock are manufactured on an extensive scale. There are foundries, machine-shops, and other mechanical establishments in town, while the mercantile business is large, prosperous, and steadily increasing.

Woonsocket, a town of Providence County, R. I., bordering on Massachusetts, 16 miles north of Providence and 26 miles south of Worcester. The town is the commercial and business center of the Blackstone valley; was incorporated in 1867; in 1890 it had a population of 16,052, and in January, 1886, of 18,852. Three railroads touch the town, and street-cars traverse the principal thoroughfares. Twenty-nine manufacturing establishments, with \$6,683,482 invested, including \$3,358,766 in machinery and tools, give em-

ployment to 6,877 operatives. These concerns pay \$2,323,435 annually in wages, and expend \$7,730,103 for materials, and their annual product is valued at \$11,894,223. Eleven cotton-mills produce 85,883,982 yards of sheetings, shirtings, and twills, and 5,388,847 yards of prints, using 11,727,500 pounds of cotton. Six woolen-mills consume 3,191,068 pounds of native wool and 1,425,619 of foreign, producing 1,682,692 yards of cloth annually. The industrial classes have over \$8,000,000 deposited in four local savings-banks. More than 500 new buildings, including a million-dollar mill, a railway-passenger station, a dozen business blocks, hospital buildings, two churches, and four school buildings, have been erected since 1880, and a model opera-house is under way. Among the new improvements are extensive public water-works, street-car service, electric fire-alarm, letter-carriers, exclusive electric street-lights, a paid fire department, and a cottage system of hospitals with park. A city charter has been asked from the Legislature, and a bill is before Congress for a public building.

Worcester, the second city in size in Massachusetts, midway between Boston and Springfield, on the Boston and Albany Railroad; population in 1860, 24,973; in 1870, 41,105; in 1880, 58,295; in 1887, estimated at 80,000. The railroad facilities now represent the Boston and Albany, Boston and Maine, and the Fitchburg, the Providence and Worcester, and the New York and New England. The city has a well-equipped street-car service. It has over 50 miles of sewers, 100 miles of water-service, and 200 miles of streets. The water-service, on the elevated storage-reservoir plan, gives a pressure that carries to the height of the tallest buildings. A post-office structure is at once to be erected. Many of the city blocks are costly and notable. The chief educational features of the city are the Worcester Polytechnic, founded in 1868; the College of the Holy Cross, 1843; Worcester Academy, 1835; Highland Military Academy, 1857; the Massachusetts State Normal School, 1871. Clark University, to the founding of which \$2,000,000 have been devoted by Jonas S. Clark, Esq., has just been established. The manufacturing industries of Worcester are many and varied, the largest being the Washburn & Moen Manufacturing Company's Wire-Works, which give employment to about 3,500 men, with \$6,000,000 product annually, or from 150 to 200 tons a day. Other large industries are Brussels carpets, of which 1,000,000 yards are made yearly; envelopes, of which, at three establishments, 8,000,000 are made daily; machinists' tools, an annual product of nearly \$2,000,000, employing 800 men; two large loom-works, giving about the same figures as the last; fire-arms, wood-working machinery, woolen and worsted goods, wrenches, skates, steam-engines, folding-chairs, wool-cards, and agricultural machinery, all represent large cap-

ital and product. In boots and shoes 14 establishments give employment to 1,800 hands with an annual product of over \$4,500,000. Worcester's prosperity has from the first been helped by a healthful and beautiful location. The city is the home of the American Antiquarian Society, with its vast library and collections. The Public Library is one of the best in the United States. The school system is excellent. The whole vicinity is filled with interest and attractions. Worcester is the shire town of one of the largest and wealthiest counties in New England.

York, the county-seat of York County, Penn., on both sides of Codorus creek, 94 miles west of Philadelphia, 57 miles north of Baltimore, 26 miles south of Harrisburg. In 1850 the census was 6,863; in 1860, 8,605; in 1870, 11,003; in 1880, 13,940. The last census, counting the suburbs, made the population nearly 15,000; but since then great accessions have been made in the south and west, as well as in the northeast parts of the city, so that now, adding the suburbs, the figure would be fully 20,000. The public buildings worthy of note are the court-house, built of granite, the jail, almshouse, Orphan's Home, opera-house, Collegiate Institute, and high-school. The Eastern, Western, and City Markets are also three fine buildings. There are 25 churches. The public schools number 50, employing more than 60 teachers. In this connection are also to be noted the Collegiate Institute, the York County Academy, and the Young Ladies' Seminary, besides private schools and business colleges. York is both a commercial and a manufacturing center. It is in the midst of one of the wealthiest and most fertile farm regions in the country. The city contains 12 good hotels and 10 banks, with an aggregate capital of \$3,000,000. There are agricultural works, a furnace, foundries, machine-shops, car-works, boiler and engine works, planing-mills, chain-works, cigar-factories, candy-factories, scale, lock, and safe works, an organ-factory, shoe-factory, extensive brick-works, tanneries, a book-bindery, and numerous printing-offices. Five weekly papers and four dailies are issued. The following are the latest manufacturing statistics by the census reports of 1880: men employed in the shops, 2,055; annual wages, \$456,616; capital invested, \$1,232,848; material consumed, \$1,274,131; annual product, \$2,285,890. The city has made such rapid strides in the past few years that the annual product of the factories and shops can not now be short of \$3,500,000, with the other statistics correspondingly increased. York began to thrive about 1861. In 1884 the city was overwhelmed with a deluging flood that swept away all the bridges and wrecked stores and dwellings. Steady improvement immediately set in—the bridges were replaced with large iron structures, seven of which, and one of wood, now span the Codorus. The water-works have been enlarged and improved, the

streets graded and macadamized, and nearly all of them are now lined with trees. There is a new street-railroad. The entire city is lighted by electricity, and telephone and telegraph wires connect with neighboring towns and distant cities. The water-supply is ample, though not without fault, as it is obtained from the Codorus.

CLARK, ALVAN, an American optician, born in Ashfield, Mass., March 8, 1808, died in Cambridge, Mass., Aug. 19, 1887. He was the son of a farmer, and obtained his education in public schools. At an early age he showed considerable artistic ability, which was put to practical use when he became an engraver for calicoes at the print-works in Lowell and elsewhere. This occupation he followed until 1835, when he settled in Boston, and there opened a studio on Tremont Street, where he continued his career as a portrait-painter for

ALVAN CLARK.

many years. His pictures of Robert Hare, Thomas Hill, and Daniel Webster, are well-known specimens of his skill. In 1846, in connection with his sons, Alvan G. and George B. Clark, he established the firm of Alvan Clark and Sons, which has since continued and become famous as the leading telescope-makers of the world. Its origin is due to the younger son, Alvan G. Clark, who is an accomplished astronomer, and who, being unable to secure suitable lenses, induced his father to establish the business. For ten years the subject of optics was carefully studied, and Mr. Clark spent some time in Europe making himself familiar with astronomy, before the reputation of the firm was fully established. His first order for a large telescope came from the University of Mississippi in 1860, the object-glass of which was to be 18½ inches, 3 inches larger than any that had hitherto been successfully used in the world. The civil war prevented the completion of the contract, and the instrument was purchased for the University of Chicago. Then followed the construction of two glasses of 26 inches each, one of which was made for the

University of Virginia, and the other for the U. S. Naval Observatory in Washington. These lenses required four years of labor, and cost \$46,000. Many others of varying sizes, from 4 inches to 36 inches, have been made for observatories throughout the world. Some idea of the labor required may be formed from the fact that for a good 4-inch objective a month's constant work is required, and for an 8- or 10-inch glass a year is necessary. In 1870 the Russian Government contracted with Messrs. Clark & Sons for an enormous telescope to be placed in its observatory in Pulkowa, and in 1888 the instrument was completed. Otto N. von Struve, the distinguished astronomer, visited all of the well-known makers in the world before giving the order. The telescope was then the largest in existence, costing \$88,000, having a clear aperture of 80 inches, a 45-foot focus, and weighing 418 pounds. It possessed a magnifying power of 2,000 diameters, and was capable of increasing the surface of the object viewed 2,500,000 times its natural size. Mr. Clark received a vote of thanks from the Imperial Academy of Science, and a gold medal from the Emperor of Russia. A few years since this firm undertook the construction of the 86-inch object-glass for the Lick Observatory on Mount Hamilton, Cal., which was completed and safely forwarded to its destination in the autumn of 1887. Mr. Clark invented numerous improvements in telescopes and their manufacture, including the double eye-piece and an ingenious method of measuring small celestial arcs. A list of the discoveries made by him with telescopes of his own construction is given in the "Proceedings of the Royal Astronomical Society" (London, vol. xvii). Mr. Clark received the honorary degree of A. M. from Amherst College in 1854, from Princeton in 1865, and from Harvard in 1874, and also the Rumford medal from the American Academy of Arts and Sciences.

COLOMBIA, an independent republic of South America, covering an area of 586,000 square miles, and having a population of 3,500,000. It has been decided that the capitals of departments are to be the following: Medellín, capital of Antioquia; Cartagena, of Bolívar; Tunja, of Boyacá; Popayan, of Cauca; Bogotá, of Cundinamarca; Santa Marta, of Magdalena; Panamá, of Panamá; Bucaramanga, of Santander; Tolima, of Ibagué. Each of these capitals is to be the seat of a superior court.

Government.—At Bogotá, on June 4, Dr. Rafael Nuñez, re-elected President for six years, from December, 1886, entered formally upon his office. Subsequently, he formed the following Cabinet: Minister of Government, Dr. Felipe F. Paul; Foreign Affairs, Dr. Carlos Holguin; Treasury, Dr. Ontario Roldan; War, Don Felipe Angulo; Education, Dr. Domingo Ospina C; Auditor-General, Dr. Carlos Martinez Silva; Public Works, Dr. Jesus Casas Rojas. Vice-President, Gen. Eliseo Payan.

The United States Minister at Bogotá is Hon.

Dabney H. Maury, and the Colombian Minister at Washington is Don Ricardo Becerra. The Colombian Consul at New York is Señor C. Calderon. The American Consul-General at Bogotá is John G. Walker.

A decree was issued in July, recalling the Colombian legations in France and Germany, and abolishing the consulates at London, Brussels, and San Francisco.

Army.—The strength of the army was fixed for 1887 at 6,500 on a peace footing, to be increased in time of war to any extent that may be deemed necessary.

Finance.—The public indebtedness in 1887 was represented by a foreign debt of \$11,158,000 and a home debt of \$11,057,628. The national bank, founded in 1881, has besides issued \$8,000,000 notes, still in circulation. A branch bank is to be established at Panama. The budget estimate for 1887-'88 fixes the income at \$20,890,000, and the outlay at \$22,893,645. The product of the salines in the interior during the last four months of 1886 gave jointly a revenue of \$483,874. Dating from Dec. 15, 1886, the Government established as a monopoly of its own the manufacture of sea-salt in the department of Panama; all salt consumed there will have to be purchased at the government offices.

Much trouble was experienced in Panama during the spring and summer respecting the circulating medium, and this led to a decree declaring legal tender, in the department of Panama, the national silver coins of 0.885 and 0.900 fineness, in dollar and fifty-cent pieces, and those of equal coinage of lower denominations, even should their fineness be inferior to that mentioned. Foreign gold and silver coins of 0.900 fineness, and national gold coins of the same quality, or of 0.666, coined in the Medellin Mint under decree 659 of 1885, and national and foreign bank-notes of all descriptions and denominations will be considered in the department of Panama to be merely objects of commerce. Meanwhile in Medellin, Cauca, in August, gold rose 20 per cent. in value, as compared with June prices, and drafts on foreign countries were at 80 per cent. premium; imported goods rose from 8 to 10 per cent. in price.

During the spring a law was passed abrogating all privileges and exemptions granted by prior legislation or government decrees in favor of banks doing business in Colombia.

Commerce.—The imports into Colombia in 1885-'86 were valued at \$6,879,541, and the exports at \$14,171,241. The United States' trade with Colombia in two years has been:

FISCAL YEAR.	Import.	Domestic export to Colombia.
1886	\$3,008,921	\$5,294,799
1887	3,950,958	5,978,965

The national legislative council determined in January that the law of Sept. 21 and 22, 1886, prohibiting the coasting-trade in sailing-

vessels from Panama southward, should not comprise the port of Buenaventura.

The Panama Canal.—On July 21, a meeting of the Panama Canal Company was held in Paris. The aggregate expenditure, during the fiscal year 1885-'86, was 144,311,119 francs, and as, since the incorporation of the company, there had been spent 495,862,076 francs, the total amount reached the sum of 640,173,195 francs. But there is to be deducted from this the sum of 38,446,785 francs not yet paid, reducing the actual disbursements to 601,726,410 francs. Deducting the latter from the share capital of the company, the 250,000 5-per-cent. bonds, the 600,000 3-per-cent. bonds, and the 409,667 4-per-cent. bonds, together, 784,098,628 francs, there remained on June 30, 1886, an available capital of 132,372,218 francs.

While the U. S. steamer "Galena" lay at anchor off Colon early in March, 1887, Lieut. Rogers was assigned by the Navy Department to accompany M. Charles de Lesseps, vice-president of the canal, on his tour of inspection. The trip began on March 10, and lasted seventeen days. The report of Lieut. Rogers embraces the following passages: "Estimates of the total excavations necessary to complete the canal are now placed at 105,090,000 cubic metres. Out of this, up to date, the amount completed is 81,920,000 cubic metres, leaving 73,170,000 metres to be excavated. Up to the end of 1885, 18,417,318 cubic metres had been excavated. During 1886 11,727,000 cubic metres were added. I put down the time of the completion of the canal at seven years. That is, without there being any hitches, and everything working in perfect order. M. Ferdinand de Lesseps has quoted the most sanguine figures as to the possible output in the coming two years. To my mind, there will be no increase on the present output. In the first place, it is easy to see that the deeper the works get, the more difficult becomes the task of removing the rock and soil; and the difficulty of the Culebra mountain has not yet been solved. M. Charles de Lesseps was rather guarded on the subject, saying: 'In two years the canal will be completed from Colon to Kilometre Forty-four, and from La Boca to Paraiso. As to the Culebra, I leave you to form your own conclusions. It is a difficult work.' The serious question in the Culebra is, how to avoid the accumulation of sediment and the vast landslides it is subject to. Last year 78,000 cubic metres of earth were washed away or fell into the bed of the canal, and, according to the rate of extraction of 1886, it must have taken the work of six weeks to make good the damage. The hill-side on the left is a mixture of sand, alluvium, and conglomerate. During the rainy season, the surface deposit becomes saturated with water, and the increased weight, coupled with the incline, causes the deposit to slide over the smooth surface of the clay into the canal excavation-works. The clay in turn contracts during the dry season, large fissures

result, and hence another source of land-slides. The natural wash of the sides by the heavy rains is another cause of deposit. Worse than all this is the fact that, up to the present time, the mountain on the left side of the cut is found to be moving bodily toward the axis of the canal, at an annual rate of from twelve to eighteen inches, owing to the cutting away of its lower support."

The Government has resolved to build a large lighthouse at Colon for its own account, instead of granting a concession to private parties. At a distance of 480 metres from the Cape of Puerto Belillo, a second lighthouse was lighted in Sabanilla harbor, Aug. 1, 1887.

The sum of \$200,000 has been voted toward building a breakwater at Carthagena.

Post-Office.—The British postal money-order system has been extended to the Isthmus.

Railroads.—The Government toward the close of 1886 granted a concession to Don Juan Gaulmin to build the following railroads: the Cauca line, the Antioquia line, and the one from Bogotá to the Magdalena river, *via* Tunja, Socorro and Bucaramanga. Much headway was made in 1887 toward completing the line of railway from Bolivar to Puerto Belillo, as well as toward finishing the wharf at the latter place. Capitalists of Bogotá have conceived the project of building a railway to Chapinero, afterward to be extended to Zipaquirá. Perhaps no other enterprise on the Isthmus has been a gainer to such an extent from M. de Lesseps's scheme of connecting the two oceans as the Panama Railroad. M. Lucien N. B. Wyse, in his late book entitled "Le Canal de Panama" (1886), says: "The railroad before the commencement of work on the interoceanic canal annually transported 27,000 passengers and 270,000 tons of merchandise sufficiently valuable to pay the exorbitant rates charged by the management. To-day, double the amount of freight is carried, including excavation materials, and the number of passengers transported exceeds 550,000, 94 per cent. of whom are workers on the canal." The road is 47 miles long, two miles longer than the proposed route of the canal, and the fare from Colon to Panama was until recently \$25 in gold, which means \$35 in Colombian currency. It has been reduced, however, to \$4.80 gold, or \$6.90 Colombian currency.

In January the exclusive privilege of providing the city of Carthagena with tramways was granted to the American engineer, Mr. J. E. Davies, for thirty years. Besides a track in the streets there will be branches to the Cabrero, the Isla de Manga, the Pié de la Popa, and the Turbaco district, four leagues.

Steamer Lines.—The Legislature of Colombia passed a bill in 1886 authorizing the Government to subsidize to the extent of \$2,000 annually any ocean steamship line that will undertake to touch regularly every two months at Santa Marta and Riohacha. The Government was empowered in January, 1887, to

renew its contract with the Pacific Steam Navigation Company, on condition of a lowering of freight rates on Colombian products, and also on merchandise that may be shipped from Panama, Buenaventura, and Tumaco. Authority was also given to advance \$8,000 to any company establishing steam navigation between Buenaventura and the San Juan river. On September 5 there arrived at Panama from Antwerp the steamer "Costa Rica" of the Marqués de Campo's new Spanish Central American line of steamships, and on September 11 the "Nicaragua," belonging to the same line, both with cargo *via* the Straits of Magellan, each of a capacity of 4,000 tons and 2,000 horse-power, the trip *via* Buenos Ayres and Puerto Coronel having been made by both in 53½ days.

Telegraphs.—In July the new telegraph between Mompos and Magangue went into operation, as did also the branch line between Carmen de Santander and La Gloria, putting Carthagena and Barranquilla in connection with Bogotá, Medellin, Tunja, Popayan, Panama, and, through the cables from the Isthmus, with all parts of the world in which cables or land-lines exist.

The Colombian Government granted in July, to the Central and South American Telegraph Company, authority to establish and operate a telegraph line across the Isthmus of Panama, and to extend its cables from Colon along the Atlantic coast of South America. Concession has been granted to connect by cable Colon and Carthagena.

Don Rufino Guzman was granted a concession in April, 1887, to build a telegraph between Bogotá and Honda, with stations at Facatativa, Aguilar, Villeta, and Guaduas.

Electric Light.—The Government, toward the close of 1886, granted a concession to Gen. Ramon Santo Domingo Vila for lighting by electricity the districts and cities of Panama and Colon, in such localities as the Government and private citizens may desire.

The exclusive privilege for twenty years was granted to Don Emilio Viollet to manufacture, use, and sell an apparatus of his invention throughout Colombia for "aerial cable transportation."

Water-works.—The laying of pipes at Bogotá for the city water-works proceeded actively under a contract with Señor Jimenez during the summer. At the same time a company was formed at Panama for supplying that city with water-works, the company paying the Government \$60,000 for the privilege, which is to last forty years, when the Government will become owner of the works. The work is to be finished in two years from the summer of 1887, the Government to cede the company for fifteen years the subvention it receives from the Panama Railroad in aid of the undertaking, which sums the company agrees to reimburse the Government for thirty years from date. United States Consul Vifquain reports to the

State Department on the subject of water-works to the following effect from Barranquilla: "Within the next five years not less than one hundred cities of South America will establish water-works, and all the material for these will be furnished by England. Large works are now in process of construction at Bogotá, and all the material for them is landed at this port. It comes from England and is carried in English bottoms. Speaking to the contractor the other day while looking at the material being put on river steamers—steamers mostly built in England—I told him that the United States could furnish better pipes than those he shipped to Bogotá. 'I know it,' said he, 'but these are good enough for all purposes, and 35 per cent. cheaper than any I priced in the States. I would prefer to deal with your people, but business is business.' An English syndicate of iron-manufacturers—the same that had operated so extensively in Chili during the last few years—has just purchased a 200-mile railroad concession in this country. It might be as well to remember that if English capital controls the railroad system of this continent, as it is in a fair way of doing, the same capital will control all the commercial and industrial avenues of this vast and extremely rich country—second, in fact, to no other land in the world in natural resources of all sorts."

Coal and Phosphate Discoveries.—Señor Jorge Isaacs, in his explorations during the summer on the shores of the Gulf of Uraba, discovered some excellent coal-fields near the shores of the gulf, and valuable phosphates in large quantities on an island in the gulf.

Mining-Schools.—The Government has resolved to establish two mining-schools, one at Ibagué and another in the department of Antioquia. The sum of \$10,000 each is set aside to build the schools, and \$20,000 annually, each, toward assisting them.

Cinchona-Bark and India-Rubber.—Messrs. Nieto, Rocha & Co., of Baranquilla, informed the Government, in December, 1886, that their "quinal" or plantation of cinchona-trees, "El Dorado," in the chaparral district, Tolima, was then in a flourishing condition, there being 600,000 trees in an advanced state of growth, together with 130,000 India-rubber trees. The samples of bark sent to Europe proved richer in quinine than those sent from Jamaica, and there was every inducement to give impulse throughout Colombia to this pursuit. At the same time they offered the Government seed for gratuitous distribution among farmers.

New Textile Fiber.—A concession was granted to Don Wenceslao Campuzano for the extraction and elaboration of the "fique" fiber, the contractor engaging to furnish the Government, within two years after his factory shall be in operation, 20,000 yards of fine carpet-tissue, 80 centimetres wide, of fast colors.

Chinese Immigration.—One of the laws passed by the Colombian Legislature prohibits the im-

portation of Chinese workmen into Colombia. This law is not retroactive, and affects no contracts made with Chinamen prior to its passage.

Literary Property.—A treaty was concluded between Colombia and Spain on Nov. 28, 1885, mutually guaranteeing and securing literary property, and on Nov. 22, 1886, a decree was published at Bogotá promulgating the law.

Diseases.—The "Medical Bulletin" of Cali, Cauca, contained an article in its June issue on leprosy, of which many cases are to be found in the interior of Colombia. The writer believes the disease can be acquired without contact, and cites the case of a man who had never been in a locality where the disease exists, and yet became afflicted with it through falling into a river while heated from a hard day's sport.

"El Tiempo," of June 15, of San José de Cúcuta, Santander, says that very few cases of yellow fever now occur there, and adds, that the doctors were about to make a report declaring that inoculation had been the conqueror in the struggle against yellow fever. About ten per cent of the inoculated patients were attacked but none of them died.

Claims of Foreigners.—Toward the close of 1886 a very important law was promulgated at Bogotá respecting the claims of foreigners who suffered losses during the late revolution. It provides that the Minister of Foreign Affairs shall receive all such claims and pronounce judgment on them; claimants will be allowed to appeal from such decisions to the Supreme Court; the nation will not hold itself responsible for damage suffered at the hands of the revolutionists; all claimants must prove their nationality by duly authenticated documents; foreigners who have not remained neutral can not present claims under this law; no claim will be received after the expiration of one year from the time of the publication of this law, even should the claimants be children, women, or persons residing abroad, otherwise entitled to claim this law, and all contracts will be null and void which may have been made between revolutionists and foreigners.

COLORADO. State Government.—The State officers during the year were as follows: Governor, Alva Adams, Republican; Lieutenant-Governor, Norman H. Meldrum; Secretary of State, James Rice; Treasurer, Peter W. Breene; Auditor, Darwin P. Kingsley; Attorney-General, Alvin Marsh; Superintendent of Public Instruction, Leonidas S. Cornell; Railroad Commissioner, A. D. Wilson; Chief-Justice of the Supreme Court, William E. Beck; Associate Justices, Joseph C. Helm and S. H. Elbert.

Legislative Session.—The sixth biennial session of the General Assembly began on January 5 and adjourned April 4. It adopted a conservative course, refusing the demands of those seeking radical legislation against corporations, especially the railroads. It changed the basis of representation for its own members, allowing one senator for every 9,381 inhabitants, and one representative for every

4,978, and redistricted the State accordingly. The danger of alien landlordism was provided against by a law prohibiting non-resident aliens from acquiring agricultural, arid, or range lands in the State, or any interest therein greater in value than \$5,000, mines and mining property being excepted from the operation of the act. Real estate owned in violation of these provisions is forfeited to the State. A new code of civil procedure was adopted, which abolishes the distinction between actions at law and suits in equity, provides that a married woman may sue or be sued as if sole, and otherwise simplifies the common-law practice. Several measures tending to increase in the revenue available for maintaining the State Government were passed. By the constitution, mines and mining property were exempt from taxation for ten years subsequent to its adoption. That period having elapsed, a bill taxing this large class of property was passed at this session. It was also voted to submit to the people, at the next election for members of the General Assembly, in accordance with a provision of the Constitution, the following question: "Shall the rate of taxation on property for State purposes for the years 1889-'90 be increased to five mills on each dollar of valuation for each of those years?" The present rate is four mills. An amendment to the Constitution, to be voted upon at the same election, was proposed, modifying the clause that forbids a State debt. It provides that within certain limits, the State may contract debts to meet casual deficiencies in revenue, to erect public buildings for the State, to suppress insurrections, to defend the State, and in time of war to assist in defending the United States. Considerable changes were made in the government and methods of the public schools. The city of Denver obtained extensive amendments to its charter. Other acts of the session were:

To prevent and prohibit the sale of injurious or unwholesome articles of food or drink.

To establish agricultural-experiment stations in El Paso, Bent, and Delta Counties, and San Luis Valley.

To regulate the use of artesian wells, and to prevent the waste of subterranean waters.

To prohibit the black-listing or publishing of employees when they have been discharged.

To establish a bureau of labor statistics.

To provide for the sale of lots and lands given to the Territory of Colorado for the purpose of aiding in the erection of a capitol building.

To prohibit the employment of children under fourteen years of age in any underground works or mines, or in any smelter, mill, or factory.

To restore the right of trial by jury.

To prevent the hiring out of convicts by the State or its officers, and to prevent the importation of materials made by convicts for use on public improvements.

To provide for the formation of corporations for the purpose of warranting or insuring the title to real property.

To establish the county of Logan, and the county-seat thereof.

To establish the county of Washington, and the county-seat thereof.

To prevent cruelty to children.

To protect the food-fishes in the natural streams of the State.

Designating the first Monday in September of each year as a public holiday, to be known as "Labor day."

Regulating the lease, sale, and management of the State lands.

To prevent discrimination in the sale or delivery of news items, news dispatches, or press reports.

To prevent frauds in the nominating of public officers at primaries, or conventions, or otherwise.

To regulate the practice of pharmacy, licensing persons to carry on such practice, and providing for the appointment and defining the duties of a State board of pharmacists.

To straighten the channel of the Rio Grande river, and to build a levee along the same at Alamosa.

To provide for the study of the nature of alcoholic drinks and narcotics, and of their effects upon the human system, by the pupils in the public schools.

To set aside not less than six hundred and forty acres in that portion of Saguache County, which includes the Royal Arch and Echo mountains, for the purpose of a State park.

Education.—The value of public-school property in the State is about \$2,500,000, an increase of 800 per cent. in five years. This is twice as much in proportion to the school population as New York holds in school property, and only slightly less in proportion than Massachusetts. The number of teachers has doubled in five years, while the enrollment shows a large increase. Of the higher institutions, the School of Mines and the Agricultural College are well attended, the latter having a total enrollment of 116 pupils in 1886. With reference to the State University at Boulder, the Governor says: "There is a general and well-founded feeling throughout the State that this institution is disappointing the expectations of its founders. It is supported by a dedicated tax of one fifth of one mill on all the property in the State, which produces an income of about \$22,000, and by a noble endowment of lands from the nation, which largely increases its resources. It has an excellent faculty of able and learned instructors; its funds are ample for its needs, and yet it lacks somewhere the vitalizing energy that insures success. There are but ten counties, besides the one in which it is situated, represented on its roll, and these ten by only fourteen scholars. The county in which it is situated sends one hundred scholars, and all other States and Territories only eighteen."

State Institutions.—The Legislature of 1887 provided for the establishment of a State Home and Industrial School for Girls, at or near Denver. The State Industrial School for Boys, at Golden, has been in existence for several years. At the close of 1886 it contained ninety pupils.

The total number of prisoners in the State Prison during the past two years was 682, the average number being 356. This is a large average in proportion to the population. The cost of maintaining the prison for the past two years, including betterments and every description of charge, has been \$269,036; total earnings, exclusive of prison-labor, on real estate, \$70,067, showing an increase over the previous

term of \$19,651. The total net charge above earnings was \$198,968.

Valuations.—The total assessed valuation of the State for 1887 was \$140,000,533, nearly one third of which, or \$45,753, 685, is credited to the county of Arapahoe, which contains the city of Denver. The total valuation for 1885 was \$115,420,193.90. In 1886 this amount was increased to \$124,269,710.06.

In 1885 the assessed lands and improvements amounted to 3,926,782 acres, valued at \$22,504,768; in 1886 there were 4,534,938 acres, valued at \$24,211,001. This is exclusive of town and city lots, which in 1885 were valued at \$41,106,457; in 1886, at \$43,779,068. The valuation of railroad property in 1886 was \$23,503,367; in 1887 it was \$23,696,666.

Corporations.—The Governor, in his message at the beginning of the year, says: "During the past two years 802 corporations have filed their certificates in the office of the Secretary of State. These nominally represent a capital of \$361,000,000, the Denver and Rio Grande Railway alone representing \$78,500,000 of the sum. It is incredible that the legitimate course of business can be healthfully promoted by any such inflated capitalization. There must be humbug, if not downright rascality, behind such a pretentious array of figures. It represents three times the total valuation of the State. I therefore recommend that you guard the good name of Colorado against a reputation for bombastical finances by considerably increasing the charge for every thousand dollars above one hundred thousand of capital stock."

Cereals.—The production of crops for 1886 is estimated as follows: Wheat, 2,100,000 bushels; oats, 800,000 bushels; barley, 250,000 bushels; and corn, 175,000 bushels. The season of 1887 has been favorable, and an increase over these figures is counted upon.

Irrigation.—As the constitution of the State declares all streams within its limits to be public property, Colorado avoids at the outset the difficulties that have hindered irrigation in California. The construction of canals has, therefore, progressed rapidly, especially in the past two years; but the system of ownership has developed tendencies opposed to agricultural interests. "A large percentage of the earlier canals were built on the co-operative plan, in which many farmers united, and through their joint credit and labor, built the canals to water their farms. This method was not suited to large enterprises, and capital was not slow to perceive that ditch enterprises offered a safe and lucrative field for investment, and, as a result, the majority of the canals constructed during the past two years, or now being projected, are owned by corporations merely as speculative enterprises." These corporations, holding no landed interests, have not hesitated to take advantage of the monopoly that from the nature of their business they must necessarily enjoy, to extort from the farmers excessive rates for the supply

of water. The Legislature has found it necessary to take the question in hand, and by several enactments of this year it gave enlarged powers to the county commissioners to fix the water-rates in any part of the county, on application of any person interested, and prohibited the exaction of more than the legal rate so established, either by means of royalty, bonus, premium, or otherwise. Any refusal to supply water at such rate is made punishable.

Stock-Raising.—Official reports show that the number of cattle in the State assessed in 1886 was 845,088, valued at \$12,425,961. This is an increase over 1885 of 66,443 in number, and \$1,132,937 in value. In 1884 there were shipped out of the State to various markets, 54,874 head; in 1885, 75,579 head; and in 1886, 122,678 head. During 1886 there were consumed within the State 66,800 head. Notwithstanding these increased shipments, the industry has not greatly prospered of late. The area of cattle-ranges is steadily lessening by the settlement of immigrants, the prices for beef have fallen, and the cost of transportation increased. Leading cattlemen, both outside and inside the State, appreciating these conditions, have organized an International Range Association. The second annual meeting of the association was held at Denver in February, 1887.

This year witnessed a practical abandonment of the custom of driving herds northward through Colorado to Wyoming and Montana, for the purpose of fattening them on the rich grasses of the northern plains. Immense herds of Texas cattle have in former years passed through the State over what is known as the "National Cattle-Trail," but so rapidly have settlements been made that herders now find their progress impeded by the fences and farms of pioneer settlers. In a few years these barriers will be entirely impassable, and Southern cattle owners will be compelled to ship their herds by rail to the North, or abandon the Northern prairies altogether.

Mining.—The product of metals for 1886 is estimated as follows: Silver, \$16,450,921; lead, \$5,123,296; gold, \$5,087,901; copper, \$132,570; making a total of \$26,794,688. This is an increase of \$4,294,688 over the figures for 1885. The production of the Leadville mines alone aggregates \$18,750,733, showing a gain over the previous year of \$1,893,071. Colorado produced in 1886 over 65 per cent. of all the lead mined in the United States. The product of the Leadville and Red Cliff mines was nearly equal to half of the output of the country. Such is the prosperity of the Leadville district that at the close of 1887 it contained over 150 distinct producing mines, the yield from which during the year will reach nearly \$16,000,000.

Increasing attention is being given to the rich coal deposits in the State. The productive and partially-developed coal-fields of Colorado embrace an aggregate area of over 1,000,000 acres, while the area of the coal-bearing formation is estimated by geologists to aggregate over

26,000,000 acres, consisting of three varieties—the lignites, bituminous and anthracite coals of various grades and qualities. These deposits underlie a great part of the plains near the foot-hills, extending from the northern part of the State to the Raton mountains, which lie along the border of New Mexico. Coal is also found in South Park, near Como; in the vicinity of Florence, above Pueblo; near Walsenburg, in Huerfano County; in inexhaustible quantities in the vicinity of Durango, near the extreme southwestern corner of the State; in the vicinity of Crested Butte, and other localities in Gunnison County, and it underlies almost the whole of northwestern Colorado. The production of the State for each of the past six years, is as follows:

YEARS.	Tons.	YEARS.	Tons.
1880.....	875,000	1884.....	1,180,024
1881.....	706,744	1885.....	1,398,796
1882.....	1,061,479	1886.....	1,436,911
1883.....	1,229,598		

The value of the product for 1886, at \$2.35 a ton at the mines, is \$3,375,095.

Oil has been struck at several places in these coal-fields, and in the vicinity of Florence, thirty miles west of Pueblo, are oil-wells that are producing about 700 barrels a day.

The Ute.—In the latter part of August the people of the State were alarmed by exaggerated accounts of an outbreak of the Ute Indians, headed by Chief Colorow. The Governor was induced to order out the State troops against them, and thought it necessary to hasten himself to the scene of disturbance in the western part of the State, not far from the town of Meeker. It was soon ascertained, however, that the whites were the aggressors, and that a sheriff's posse, sent to arrest several Indians on the charge of horse-stealing, had taken advantage of its authority to make brutal attacks upon a peaceable Indian camp. Colorow's party were taken entirely by surprise at the first attack, and after a short skirmish retreated toward their reservation, which was several days' journey distant. The whites followed, and just before the border of the reservation was reached fell upon them again, killing several of their number, and driving off their ponies and flocks. No excuse for these attacks can be found. When responsible officials reached the scene, the aggressors were restrained, and Colorow with his followers returned to their reservation. The Indian loss, besides a half-dozen or more of their own number killed, was estimated at over 600 horses, with 37 head of cattle, and 2,330 sheep and goats. For these animals restitution was made. On the other side three white men were killed, and the State was subjected to a needless expense of several hundred thousand dollars for support and payment of the troops called out. The bitter hatred felt by the settlers against the Indians was the chief cause of this unfortunate episode.

COMMERCE AND NAVIGATION OF THE UNITED STATES.—The aggregate volume of American

foreign commerce for the year ended June 30, 1887, was \$93,542,013 greater than for the preceding fiscal year. The imports of merchandise in 1887 were of the value of \$692,819,768, as compared with \$635,436,136 in 1886. The total value of the exports of merchandise in 1887 was \$716,183,211, as against \$679,524,830 in 1886. There was a surplus of exports over imports of \$23,868,443 in 1887, as compared with \$44,088,694 in 1886. The value of the exports of domestic merchandise in 1887 was \$708,022,923, as compared with \$665,964,529 in 1886; that of the exports of foreign merchandise \$18,160,388, as compared with \$18,560,301. The increase in the exports of domestic products was \$37,058,394.

The imports of specie in 1887 amounted to \$60,170,792, as against \$38,593,656 in 1886; and the exports of specie to \$35,997,691, as against \$72,468,410, showing an excess of imports in 1887 of \$24,173,101, as compared with an excess of exports in 1886 of the amount of \$38,869,754.

Imports.—There was an increase in the value of merchandise imports in 1887, as compared with the total value in 1886, of \$56,883,682, or 9 per cent. The increase in the importation of articles on the free list was \$22,061,881, and in dutiable merchandise \$34,821,797. The following imports of free merchandise show a material increase:

IMPORTS.	Increase.
Chemicals.....	\$2,304,226
Coffee.....	18,674,668
India-rubber and gutta percha, crude.....	1,868,691
Silk, unmanufactured.....	1,863,561
Tin bars.....	1,068,944

The dutiable articles which showed the largest increase were as follow:

IMPORTS.	Increase.
Animals.....	\$1,068,566
Art works.....	1,385,478
Fancy articles.....	1,884,990
Flax, hemp, jute, etc.:	
Unmanufactured.....	2,352,466
Manufactures.....	969,898
Fruits and nuts.....	2,447,873
Hops.....	2,959,680
Iron and steel:	
Ores.....	\$512,324
Pig-iron.....	2,473,374
Scrap-iron.....	2,910,185
Railway-bars, steel.....	1,213,273
Ingots, etc.....	3,589,490
Machinery.....	677,578
All other.....	507,127
	12,461,410

Precious stones.....	2,623,292
Silk manufactures.....	3,859,984
Wools:	
Combing.....	919,796
Carpet.....	1,973,295
Wool, manufactures.....	8,431,899

The largest decrease among the articles of the free list was in hides and skins, amounting to \$2,480,212, and in seeds not medicinal, amounting to \$937,125. The dutiable articles showing the largest decrease were the following:

IMPORTS.	Decrease.
Breadstuffs.....	\$1,295,248
Cotton, manufactures.....	764,918
Leather.....	1,064,547
Seeds not medicinal.....	937,125
Sugar, molasses, and candy.....	2,698,529
Wools, clothing.....	3,219,698

Exports.—The values of the principal articles of domestic merchandise exported during the two years ended June 30, 1886 and 1887, were as follow :

ARTICLES.	1887.	1886.
Animals	\$10,599,862	\$12,518,660
Broadstuffs	165,763,662	125,946,558
Coal	4,526,926	4,199,590
Copper, and manufactures of	8,727,447	5,671,748
Cotton, and manufactures of	221,151,899	219,045,576
Furs and fur-skins	4,807,277	8,821,102
Iron and steel, and manufactures of	15,968,756	18,755,490
Leather, and manufactures of	10,486,188	8,787,692
Oil—cake and oil—cake meal	7,919,691	9,068,714
Oil, mineral	46,524,915	50,199,844
Provisions :		
Meat products	82,945,994	79,748,750
Dairy products	9,837,802	10,876,466
Sugar	11,442,387	10,977,759
Tobacco, and manufactures of	29,230,672	80,424,908
Wood, and manufactures of	19,654,984	20,748,890
Total	\$644,225,211	\$605,010,177

The values enumerated in the above table constituted 91·6 per cent. of the total value of domestic exports for 1887, and 91·2 per cent. of the total value for 1886.

The values of exports of domestic merchandise during the year ended June 30, 1887, classified according to sources of production and the proportion of the total value represented by each group, were as follow :

GROUPS.	Value.	Per cent.
Products of agriculture	\$528,073,798	74·41
Products of manufacture	186,785,105	19·45
Products of mining (including mineral oils)	11,758,662	1·67
Products of the forest	21,126,273	3·01
Products of the fisheries	5,155,775	0·78
Other products	5,173,810	0·78
Total	\$708,022,223	100·00

The articles of domestic product in which there has been a material increase in the values exported in 1887, and the amount of the increase in each, were as follow :

EXPORTS.	Increase.
Wheat	\$40,458,760
Wheat flour	13,507,127
Pork and meat products, except beef products ..	6,185,297
Leather, and manufactures of	1,895,456
Furs and fur-skins	1,436,175
Cotton, unmanufactured	1,186,415

The exports which show a material falling off in the values exported were the following :

EXPORTS.	Decrease.
Corn	\$12,838,561
Mineral oils	8,374,929
Beef products	2,958,053
Spirits, distilled	1,944,411
Oats	1,765,138
Hops	1,659,518
Copper-ore	1,374,955
Tobacco, and manufactures of	1,194,286
Fire-arms	1,114,407
Dairy products	1,089,164

Imports entered for Consumption.—The total value of imported merchandise entered for consumption in 1886-'87 was \$683,418,981, exceeding the total of the preceding fiscal year by \$58,110,167, or 9·3 per cent. The value of dutiable merchandise entered for consumption was \$450,325,322, as compared with \$418,-

778,055 in 1886; the value of merchandise free of duty, \$233,093,659, as compared with \$211,530,759. The amount of ordinary revenue collected on imports in 1887 was \$212,032,424, of which 61·3 per cent. was collected under specific, and 38·7 per cent. under ad-valorem rates. In 1886, on dutiable imports amounting to \$413,778,055, the amount collected was \$188,588,171, of which 60·5 per cent. represents specific, and 39·5 per cent. ad-valorem duties. In 1888, just before the change in the tariff, the dutiable merchandise taken out of bond amounted to \$493,916,884, on which duties were collected to the amount of \$209,650,699, of which specific duties formed 56, and ad-valorem duties 44 per cent. The increase of \$23,653,627 in the amount of ordinary customs revenue in 1887 over 1886 took place in the following classes of imports :

CLASSES OF ARTICLES.	1886.	1887.	Increase.
Sugar, sugar-candy, and molasses ..	\$51,778,948	\$58,016,686	\$6,237,738
Iron and steel, and manufactures of ..	14,681,576	20,712,234	6,030,658
Wool and manufactures of :			
Wools	5,126,108	5,899,517	773,709
Manufactures	27,278,528	29,729,717	2,451,189
Silk, manufactures of	18,388,097	15,540,301	1,602,204
Tobacco, and manufactures of	8,311,114	9,127,758	816,644
Glass and glassware ..	8,694,924	4,510,312	815,868
Fruits, including nuts	8,498,569	4,210,099	711,580
All other articles	60,121,238	64,284,500	4,163,262
Total	\$188,979,897	\$212,082,424	\$23,653,627

The increase of \$58,110,167 in the total value of merchandise entered for consumption was principally in the following articles :

ARTICLES.	1886.	1887.	Increase.
Free of duty :			
Coffee	\$42,675,000	\$54,980,701	\$12,685,101
Tin, in bars	5,873,773	6,927,710	1,058,937
Ores (emery, gold, and silver)	1,342,294	2,340,925	2,497,631
Dutiable :			
Iron and steel, and manufactures of :			
Ores	1,812,822	2,112,128	799,806
Pig iron	4,041,867	6,510,126	2,468,759
Scrap—iron and steel	567,402	3,728,471	3,166,069
Railroad-bars, iron and steel	974,873	1,000,329	725,451
Bars, billets, etc., of steel	1,859,897	5,529,704	3,669,877
All other	30,555,901	31,748,223	1,157,247
Total	\$88,681,777	\$50,618,936	\$11,967,909
Wool and manufactures of :			
Wools	\$18,794,218	\$16,351,870	\$2,557,157
Manufactures	40,586,509	44,235,344	3,698,735
Total	\$54,380,722	\$60,588,614	\$6,255,592
Silk, manufactures of	\$28,055,855	\$31,264,277	\$3,208,422
Jewelry and precious stones ..	8,867,818	10,981,192	2,613,354
Flax, hemp, jute, and manufactures of	81,612,641	88,807,969	2,194,648
Fruits and nuts	12,978,908	15,088,074	2,114,766

The average ad-valorem rates of duty on articles paying a higher rate in 1887 than in 1882 were as follow: }

ARTICLES.	1882.	1887.
Sugar and molasses	52-05	78-15
Cotton, manufactures of	39-06	40-17
Glass and glassware	56-94	59-01
Tobacco, and manufactures of	78-03	88-83
Liquors:		
Malt liquors	44-49	48-47
Spirits, distilled	142-79	154-01
Wines	49-53	54-90
Salt	45-52	49-92

The increase in the average duties ad valorem on sugar, molasses, malt liquors, spirits, and salt is mainly due to a decrease in the import prices of these articles, the rates of duty being specific, and in the case of tobacco and wines to increased tariff rates.

In the following articles there has been a decrease in the average rates of duty ad valorem:

ARTICLES.	1882.	1887.
Wool, raw	37-80	36-08
Wool, manufactures of	63-12	67-31
Iron and steel, and manufactures of	44-77	40-99
Silk, manufactures of	50-05	49-71
Fruits and nuts	27-90	24-08
Buttons and button materials	28-71	28-79
Paper, and manufactures of	34-69	31-89
Musical instruments	30-00	25-09
Rice	98-54	64-01

Foreign Carrying-Trade.—The following table shows the values of the imports and exports of the United States carried respectively in American vessels and in foreign vessels during each fiscal year, from 1856 to 1887 inclusive, with the percentage carried in American vessels:

Year ending June 30—	In American vessels.	In foreign vessels.	Per cent. carried in American vessels.
1856	\$493,263,274	\$150,236,576	75-3
1857	510,331,027	213,519,796	70-3
1858	447,191,304	160,066,337	73-7
1859	460,741,831	229,516,211	66-9
1860	507,947,737	255,040,738	66-5
1861	381,516,733	308,473,273	65-2
1862	317,635,418	318,015,236	50-0
1863	241,572,471	343,056,631	41-4
1864	184,061,456	433,793,543	27-5
1865	167,402,373	437,010,124	27-7
1866	323,711,861	635,226,691	32-2
1867	297,334,904	531,330,403	33-9
1868	297,931,573	550,546,074	35-1
1869	299,954,773	536,492,013	33-1
1870	352,939,401	638,977,458	35-6
1871	353,664,173	755,322,576	31-9
1872	345,331,101	539,943,362	29-5
1873	346,306,532	966,723,651	25-8
1874	350,451,934	339,206,106	26-7
1875	314,237,793	334,788,517	25-8
1876	311,076,171	313,354,937	33-1
1877	316,630,231	559,920,536	26-5
1878	318,050,906	376,991,129	25-9
1879	373,015,692	311,239,232	22-6
1880	256,346,577	1,224,263,434	17-13
1881	250,536,420	1,369,002,933	16-22
1882	227,229,745	1,212,973,769	15-40
1883	240,430,500	1,258,506,924	15-54
1884	233,609,035	1,127,793,199	16-60
1885	194,365,748	1,079,516,566	14-76
1886	197,349,503	1,073,911,118	15-01
1887	194,366,746	1,165,194,503	13-50

Of the exports and imports still carried under the American flag, less than one half are carried in steam-vessels.

CONGREGATIONALISTS. The following is a summary of the statistics of the Congregational churches in the United States, as they are given in the "Congregational Year-Book" for 1887:

STATES AND TERRITORIES.	Churches.	Ministers.	Church-members.
Alabama	20	14	1,261
Arizona	8	8	102
Arkansas	9	7	333
California	114	134	7,308
Colorado	31	25	1,373
Connecticut	297	338	55,104
Dakota	140	81	4,461
District of Columbia	4	12	1,119
Florida	29	25	534
Georgia	13	17	1,604
Idaho	1	1	14
Illinois	251	255	27,695
Indiana	33	22	2,039
Indian Territory	13	6	193
Iowa	261	222	19,917
Kansas	159	147	9,243
Kentucky	12	6	336
Louisiana	19	19	1,419
Maine	244	174	21,111
Maryland	2	2	273
Massachusetts	536	665	94,937
Michigan	232	251	19,332
Minnesota	145	118	10,943
Mississippi	8	4	163
Missouri	79	71	6,406
Montana	6	4	207
Nebraska	155	122	6,452
Nevada	1	1	45
New Hampshire	183	176	19,943
New Jersey	25	27	3,533
New Mexico	7	10	103
New York	261	303	37,501
North Carolina	16	10	1,004
Ohio	223	224	24,739
Oregon	27	26	1,116
Pennsylvania	30	72	8,130
Rhode Island	28	50	5,353
South Carolina	8	8	304
Tennessee	22	17	1,115
Texas	15	14	613
Utah	4	10	218
Vermont	193	199	19,755
Virginia	2	1	143
Washington Territory	51	33	1,196
West Virginia	2	2	145
Wisconsin	201	167	13,932
Wyoming	8	3	294
Total	4,277	4,090	436,379

Of the churches, 3,185 were recorded as "with pastors," and 1,092 as "vacant." Of the ministers, 2,352 were "in pastoral work," and 1,238 "not in pastoral work." The number of additions to the churches during the year by profession of faith was 27,166. The number of persons in Sunday-schools was 521,933; number of families represented in the churches, 245,068. The total amount of benevolent contributions reported by 3,435 churches was \$1,677,210, and the amount of contributions for home expenditures returned by 2,938 churches was \$3,909,225.

The seven theological seminaries—Andover (Mass.), Bangor (Me.), Chicago (Ill.), Hartford (Conn.), Oberlin (Ohio), Pacific (Oakland, Cal.), and Yale (New Haven, Conn.)—returned for 1886, 44 professors, 22 instructors or lecturers, 10 resident licentiates, 19 in advanced or graduate classes, and 393 students,

of whom 86 were "special" students. Of the "special" students, 12 were in German, 18 in Dano-Norwegian, 26 in Swedish, and 4 in Slav-ic departments.

American College and Education Society.—The income of the American College and Education Society for the year 1885-'86, was \$76,641; of which \$52,529 were contributed for colleges and paid to them, and \$18,299 were paid to students fitting for the ministry. Two hundred and ninety-one young men had received assistance from the society during the financial year, and 7,170 had been aided by it since 1816. Twenty-three colleges and theological seminaries had been assisted since 1843; three of which had passed off the list of assisted institutions during the past year, while two others had been added to it. The society had a scholarship fund of \$91,718, the income from which had been \$4,983, and a secretary fund of \$11,700, which had yielded an income of \$774.

New West Education Commission.—The income of the New West Education Commission for the year 1885-'86 was \$57,862, and its expenditures were \$2,998. The receipts exceeded those of any previous year by \$7,204. The commission had maintained 35 schools of all grades, with 63 teachers, and 2,560 pupils, of whom 764 were Mormons, 541 "Apostates," and 142 Mexicans. The Woman's Home Missionary Association, of Boston, was supporting 8 teachers in co-operation with the association, in Utah and New Mexico; and 10 State Woman's Missionary Unions were auxiliary to it.

The Sunday-School and Publishing Society sustains Sunday-school missionaries, and furnishes Sunday-school helps, libraries, and other literature to needy Sunday-schools. The National Council of the Congregational churches has recommended it as a worthy object for contributions to the extent of \$100,000 a year.

American Home Missionary Society.—The sixty-first annual meeting of the American Home Missionary Society was held at Saratoga Springs, N. Y., June 7. The Rev. Julius Seelye, D. D., LL. D., presided. The Executive Committee reported that the entire resources of the society for the year had been \$510,144, and the expenditures had been \$512,741. Fifteen State auxiliary societies of women were organized and actively at work; the contributions to the Woman's Fund for Foreign Work had been \$5,674; and the Ladies' Missionary Society, having its office in Boston, had furnished \$1,700 for the support of four teachers in Arkansas and the Indian Territory. Fifteen hundred and seventy-one missionaries had been employed, of whom 5 had preached to congregations of colored people, and 136 had preached in foreign languages; 29 to Welsh congregations, 40 to German, 38 to Scandinavian, 14 to Bohemian, 1 to Armenian, 1 to Spanish, 2 to Chinese, 1 to Indian, 7 to French, and 3 to Mexican congregations. They had had the

care of 2,188 Sunday-schools, 323 of which had been newly organized, comprising in all about 130,000 pupils. One hundred and thirty-five churches had been organized, 63 churches had become self-supporting, and 112 new houses of worship had been completed. The number of additions to the churches by confession of faith had been 6,469. The amount of contributions to benevolent objects, reported by 806 missionaries, was \$36,809. The Executive Committee of the society having been instructed in 1886 "to take steps for the removal of any existing impediments which debar the society from holding its annual meetings wherever it may choose to direct," reported that the impediments could not be removed, and that the annual meeting must be held within the State of New York. A report on the Christianization of cities, adopted by the society, declared that that work could not be accomplished by mission chapels and evangelistic services, but demanded churches, composed of Christian families and promoting Christian family life. These churches would need to be helped in their support by their more prosperous neighbors, constituting the service "a foreign missionary work on home soil." It ought to be carried on undenominationally in spirit, but would have to be sustained by denominational methods and organizations; and that churches in each city should assume the responsibility for the evangelization of that city, while the society should assume only the responsibility of giving to them necessary aid, and as it is needed. The officers of the society having been requested to compile the statistics bearing on the subject of interference between denominations in the home missionary work, were given another year.

American Congregational Union.—The thirty-fourth annual meeting of the American Congregational Union was held in New York, May 12. The Rev. William M. Taylor, D. D., LL. D., presided. The income of the society for the year had been \$120,597. The receipts on account of the parsonage loan fund had been, for the year, \$7,543, and for the five years since the fund was instituted, \$50,320. Toward a fund of \$100,000, which the trustees were endeavoring to raise for work at large centers of population, \$64,150 had been paid in. The Union had aided in the completion of 84 houses of worship, and 31 parsonages.

The Andover Cases.—The Board of Visitors of Andover Theological Seminary announced their decision in the cases of the professors who were charged with holding and teaching certain erroneous doctrines, particularly the doctrine of a future state of probation after death (see "Annual Cyclopædia" for 1886), on the 15th of June. These cases originated in charges presented to the Board of Visitors, July 23, 1886, by J. W. Wellman, D. D., a trustee of the seminary, Dr. H. M. Dexter, Dr. O. T. Lanphear, and Prof. J. J. Blaisdell, "Committee of Certain of the Alumni," against Profs.

Egbert C. Smyth, D. D., William J. Tucker, John W. Churchill, George Harris, and Edward Z. Hincks, all holding positions as instructors in the institution, of holding and teaching the doctrine mentioned. A preliminary hearing was granted by the Board of Visitors, Oct. 25, 1886, when an amended complaint was presented, setting forth four charges, with many specifications, upon which a trial was held during the last days of the year. In their decision, as announced in June, the board declared that they had found that Prof. Smyth, as professor, maintained and inculcated beliefs inconsistent with and repugnant to the creed of the institution and its statutes, in the following particulars, as charged in the amended complaint, viz.:

That the Bible is not "the only perfect rule of faith and practice, but is fallible and untrustworthy, even in some of its religious teachings.

"That no man has power or capacity to repent without knowledge of God in Christ.

"That there is and will be probation after death for all men who do not decisively reject Christ during the earthly life."

The board, therefore, "adjudged and decreed that Prof. Smyth be removed from his position, and that the office be declared vacant." In the case of Profs. Tucker, Churchill, Harris, and Hincks, the Rev. Mr. Eustis, a member of the board, declined to act with his associates, upon the ground that he was not present on the day of the hearing of the complaints, when the respondents severally appeared and made their statements in defense. Thereupon, the complaints as amended being taken up and severally considered, none of the charges contained in them were sustained. The Board of Visitors at the same meeting refused to approve of the election of the Rev. Frank E. Woodruff to the Associate Professorship of Sacred Literature in the Theological Seminary. Upon the announcement of the decision, the Board of Trustees of the Seminary expressed regret:

That the charges made against the professors were not prosecuted before the Board of Trustees, and denied the authority and jurisdiction of the Board of Visitors, asserting that the latter had only appellate power, and that the case should have been prosecuted before the trustees in the first instance.

They regretted all the more that this case was first prosecuted before the Visitors, because the matter had previously been brought to the attention of this board in a memorial presented by one of the Trustees, Jan. 12, 1886, referring to public reports and charges against the professors, and praying that the Board of Trustees would request the Board of Visitors to investigate the same. This the Board of Trustees declined to do, on the ground that if sufficient cause to consider them existed, it was the duty of this board to investigate the charges before they should go to the Board of Visitors.

In further regret, the circular continued:

That when proceedings had been initiated before the Visitors all effort of this board to secure a standing at the hearing failed. We felt that as a Board of Trustees especially charged with the administration of the seminary, we should have been recognized as a party in a trial which involved the best interests of the institution intrusted to our care.

The Trustees had carefully weighed all the evidence presented at the trial, and with all the other light they could gain, had come to the conclusion that the charges were not sustained, saying that—

In our opinion the teachings of the professors accused are either not correctly reported, or, when correctly represented, are not inconsistent with the creed which the professors have signed and are bound to sustain in all their utterances. . . . In our judgment the whole aim of the professors has been to enlarge and deepen the apprehension of Christian truth in its application to the problems of faith and the work of the Church in the world, and they have done this along the lines of the symbols of the seminary. And we think that they deserve for their industry, their zeal, their scholarship, and their piety, not the disfranchisement and suspicion of the friends of the seminary, and of sacred learning, but encouragement and sympathy. In conclusion, we can not refrain from expressing our deep conviction that no greater mistake can be made in endeavoring to promote the growth of Christ's kingdom than that of insisting that such differences on points in eschatology as exist between the accusers and the accused in this case should be made the occasion of accusations so grave, and a trial so momentous as that which these distinguished and high-minded professors have been called upon to face.

Professor Smyth, through his counsel, on the 1st day of November, entered an appeal in the Supreme Court of Essex County, Mass., against the finding of the Board of Visitors, to which it was agreed that the answer of the board should be filed by December 1. The appeal under the statute founding the seminary has to be argued before the full bench of the court sitting at law.

The American Board.—The American Board of Commissioners for Foreign Missions, the oldest of American foreign missionary societies, is a close corporation, consisting at present of about 200 corporate members, all of whom derive their right and title as such from the nine commissioners who were designated in the original act of incorporation by the Legislature of Massachusetts. As the area of the churches contributing to sustain the work of the board increased, additional members were voted in so as to give the new contributors representation. These corporate members constitute the body who transact the business and decide upon all questions at the annual meetings of the board, while honorary members and members by virtue of their contributions take part in the discussions, but do not vote. The Prudential Committee, to whom the management of affairs and the control of its policy is committed during the intervals between the annual meetings of the board, consists of five clergymen and five laymen living in Boston or its vicinity, and meets weekly. The three secretaries and the treasurer, who are elected by the board, are not members of this committee, but attend its meetings.

The seventy-eighth annual meeting of the Board was held in Springfield, Mass., beginning October 4. The President, the Rev. Mark Hopkins, D. D., having died since the last meeting of the board, Mr. E. W. Blatchford, Vice-President, presided. The ordinary receipts for the

year had been \$476,444; the total receipts, including what had been spent out of funds contributed for special work (in China, Japan, Central Africa, and Northern Mexico), had been \$679,573; the expenditures had been \$679,877. The grounds of the Home for Missionary Children at Auburndale, Mass., had been bought for the society. The Home had entertained during the year 82 missionary children and six families, and since its foundation, nineteen years previously, 111 children. In the "survey" of the missionary work, notice was taken, in connection with the missions in Turkey, of divisions caused by the proselyting efforts of agents belonging to another denomination, and of the prosperity of the Bulgarian mission. Four weekly newspapers were published in these missions, in as many different languages, having a circulation of 9,000 copies. In Japan there were 40 churches, with more than 4,000 members, and the Christian College had 800 students. In Africa, progress was reported in the organization of the two central missions and the removal of a serious obstacle at Bihé by the death of the hostile king. It had become expedient to resume missionary work to a certain extent in the Sandwich Islands, and to send new missionaries there. The Micronesian missions continued to advance rapidly, and included 46 wholly self-supporting churches, with 5,312 communicants. The mission in Ponape had been interrupted by the arrest by the Spanish Governor, of the Rev. Mr. Doane, on frivolous charges, and his deportation to Manila, in the Philippine Islands, for trial. But, on the representations of the Government of the United States, he had been released, and was to be restored to his work. The following is the General summary of the missions, in Mexico, Spain, Austria, India, Ceylon, Japan, China, Africa, the Sandwich Islands, and Micronesia:

MISSIONS.

Number of missions	92
Number of stations	89
Number of out-stations	891

LABORERS EMPLOYED.

Number of ordained missionaries (11 being physicians)	166
Number of physicians not ordained, 8 men and 4 women	12
Number of other male assistants	10
Number of women (wives, 168; unmarried, besides physicians, 106)	269
Whole number of laborers sent from this country	457
Number of native pastors	135
Number of native preachers and catechists	898
Number of native school-teachers	1,164
Number of other native helpers	825
Whole number of laborers connected with the missions	2,494

THE PRESS.

Pages printed, as nearly as can be learned	19,650,000
--	------------

THE CHURCHES.

Number of churches	825
Number of church-members	28,042
Added during the year	2,906
Whole number from the first, as nearly as can be learned	101,089

EDUCATIONAL DEPARTMENT.

Number of high-schools, theological seminaries, and station-classes	55.
Number of pupils in the above	2,622
Number of boarding-schools for girls	41
Number of pupils in boarding-schools for girls	2,318
Number of common schools	678
Number of pupils in common schools	84,417
Whole number under instruction	41,151

Doctrinal Tests for Missionaries.—The reports of the Prudential Committee contained a full account of its action on two matters which had been referred to it for consideration at the preceding meeting of the board. The first of these matters related to the expediency of referring questions respecting the doctrinal soundness of candidates for appointment as missionaries to councils of churches. The second matter related to representations which were made by the Congregational church of New Haven, to which the person in question belonged, in favor of the Rev. Mr. Hume, the missionary whom the committee had declined to reappoint to his post in the Marathi Mission because of his belief in the doctrine of probation after death. On this subject, the committee had been instructed to "seek to the utmost of its power an adjustment of its differences." After correspondence and several interviews, the committee had decided, on the 11th of February, that it understood—

That under the action of the board at its last annual meeting it had no option but to decline to send out as a missionary any person who has committed himself to the acceptance of the hypothesis of a probation after death. That action was in the following terms: "The board is constrained to look with grave apprehension upon certain tendencies of the doctrine of a probation after death, which has been recently broached and diligently propagated, that seems divisive and perverse, and dangerous to the churches at home and abroad. In view of those tendencies, they do heartily approve of the action of the Prudential Committee in carefully guarding the board from any commitment to the approval of that doctrine, and advise a continuance of that caution in time to come." In the case of Rev. R. A. Hume, the report continued, "embarrassment and consequent delay have arisen from doubt as to his exact position on the subject. After several interviews and much correspondence, it appears that Mr. Hume regards the hypothesis in question as not forbidden by the Scriptures, and that some considerations favor it, while on the other hand he affirms that he has not in his past utterances committed himself, and that he does not now commit himself, to the acceptance of the hypothesis. It has been a question with the committee how far sympathy with this hypothesis, even where it is not accepted, would control one's thought and action; but it has not been unmindful of the fact that Mr. Hume is not a new applicant for missionary appointment. He has for eleven years rendered good service in the mission field, and the record of that service, as well as his recent statements, give reasonable assurance that he will work in the future, as in the past, as a loyal representative of the American Board, and in harmony with the wishes of his mission, as expressed in their letter of October 28, 1886: 'that he avoid the preaching or teaching of any speculation in favor of a future probation.' The committee therefore assents to the return of Mr. Hume to his cherished work in the Marathi mission."

In reply, Mr. Hume, acknowledging the receipt of the committee's assent to his return to his missionary work, said:

In deference to the wishes of many members of the board and members of my mission, I can again heartily assure you that I shall feel such restriction as ought to influence a Christian man who is accustomed to respect, so far as he conscientiously can, the wishes of his associates, and is accustomed to study the things that make for peace. That I am such a man my missionary brethren heartily testify. Moreover, I shall carefully bear in mind the divergent views of the constituency of the board and the solicitude of many, and shall do what I can to satisfy all. But I assume that you understand me as otherwise returning with such liberty of thought and speech as is enjoyed by evangelical ministers at home, and as free from pledges. Therefore, I gladly accept the opportunity to return to India to renew my work in the same spirit and devotion as in the past.

On the same day of the date of this letter, a communication was inserted in the newspapers by Mr. Hume, declaring his intention to return to India and reiterating the expressions of the letter. In view of these documents, the committee reaffirmed its action, which had been based on the fact that "Mr. Hume in letters and statements was understood by the committee to give reasonable assurances that he would work in harmony with the wishes of the Mission as expressed in their letter of October 28, 1886." The letter here referred to had been received from the members of the Marathi Mission at Ahmednuggar, India, and contained expressions of high regard for Mr. Hume, and testimony to the value and efficiency of his labors, with the intimation of a desire that he should return; to which was added:

We were, however, surprised and grieved at his utterances at Andover, which have been so widely published. We have no sympathy with the sentiments he there expressed. We believe that the teaching of a future probation here, even as a hypothesis, would be extremely harmful to our work. While, therefore, the question of his return must be decided by the Prudential Committee, we wish to say that we would gladly welcome brother Hume back to occupy the position he held before and to teach the same doctrines as before, provided that he avoid the preaching or teaching of any speculation in favor of a future probation.

Upon the action of the board at its meeting in 1886 approving the course of the Prudential Committee in acquainting itself in the doctrinal fitness of candidates for appointment as missionaries, the committee had adopted the following minute:

1. The question of appointing certain candidates whose applications for missionary service indicated that they accepted under some form of statement the hypothesis of a probation after death for those who have not had the gospel revelation of Christ during the earthly life, came before the committee last year, and the committee decided that it was not expedient at present to make the appointments.

2. This action of the committee was severely criticised in certain quarters, and was brought before the board at its last annual meeting, accompanied by a definite statement as to the course pursued by the committee, with the reasons for that course.

3. The board, after prolonged deliberation and discussion, voted with emphasis that they approved of the caution exercised by the committee on the matter under debate, and recommended the exercise of the same caution in the future.

4. The present committee therefore has no option on this matter, except to follow the instructions of the

board and to decline to appoint candidates who hold these views.

In accordance with these principles, of 101 cases of applications which had come before the committee for decision, 71 had received appointment.

Of the 80 persons who did not receive appointment, the reasons relating to 23 had no connection with defective or erroneous doctrinal views. Of the remaining seven, one had been postponed in order that further time might be given for thought, particularly as to the scriptural teachings upon the conscious existence of the wicked after death; two had been declined on account of the avowal of their belief in universal salvation; one who particularly desired appointment as missionary teacher to Japan, had been declined on account of serious doubts as to the existence of a personal God, and three had expressed such views in relation to the hypothesis of probation after death that they seemed to the committee to be included in the class referred to in the action of the board and in the minute of the committee. The action of the committee in all these cases was, as usual, taken in view not only of the correspondence involved, but also in view of the reports of personal interviews with the candidates, which, of course, cover impressions and statements not reduced to writing.

The precise action of the committee in relation to the cases involving doctrine was given in full, together with the correspondence that had been had with the parties. Concluding its report, the committee said that it was its serious conviction, confirmed by many years' experience—

That the commonly received doctrines of the churches which sustain the missions of the board include the scriptural teaching of the decisive nature of the present earthly probation as related to final character and destiny. It has also been a recognized principle with the committee, that whenever any proposed action would, if adopted, be, in the judgment of the committee, contrary to the conscientious convictions of a large part of the constituency of the board, it was not expedient to recommend such action. These considerations, which directed the course of the committee during the preceding year, have continued to guide them during the year now under review, with the added emphasis of what they regarded as the decisive and helpful instructions of the board itself at its last annual meeting.

With regard to the question of the expediency of calling councils of the churches to determine upon the doctrinal fitness of candidates, the committee reported that the practice of seeking the advice of councils had been adopted in the early days of its organization, but had been abandoned because it had seemed to be needless, and also because it had been adopted without due regard to ecclesiastical regularity. Since then, the committee's discretion in the matter had not been questioned until the present issue arose. It was shown that while councils were Congregational institutions, the board was not exclusively Congregational, but included Presbyterians among its members, its missionaries, and the contributors to its funds. To make it a denominational and ecclesiastical body would be a breach of trust as toward these persons. Councils are not bodies of sufficiently extensive jurisdiction to assume the responsibility for the appointment of missionaries. Composed of local

groups of churches, they did not and could not represent the whole Church; or in any way combine the diversified views and wants that exist within it. "No council limited, as is inevitable, can represent or act for the constituency of a body scattered over the whole territory of the United States, and which includes contributors in other lands also." Councils, moreover, were transient bodies, existing only for a few hours, and could not be held to a responsibility more abiding than their own ephemeral existence. They end their functions in the induction into the ministry of ministerial missionaries. The Prudential Committee had work to do in view of its entire make-up, and could not farm out any portion of its responsibility. After considering these and other like points in full, the report concluded:

The usual method, aimed at and pursued by the Prudential Committee the past year, still commends itself as the wisest and best. Should the method so long tested, and with satisfactory results, have the approval of the board and its friends, present embarrassments will, we believe, be removed, and further embarrassments will be averted more satisfactorily than in any other way. Seeing then that, by general consent and usage, such bodies as the American Board can not appropriately call ecclesiastical councils in any case; seeing that to call such councils only in doubtful cases turning upon doctrinal views of candidates would be open to very grave objections, and that to call them for all candidates would be superlatively cumbersome; seeing that councils, being local, ephemeral, and irresponsible, are inadequate for the purpose named; seeing that a mixed responsibility in the selection of candidates would produce friction and dissatisfaction; and seeing that unity of trust in the appointment of missionaries and in the administration of funds for their support has borne the test of long experience, and will secure a wider harmony than any other method—the Prudential Committee deem the measure inexpedient.

Majority and minority reports were brought in by the committee to whom the report of the Prudential Committee was referred. The majority report referred to a resolution which had been adopted by the board more than thirty years before, declaring that the contributors to the funds of the board would hold the Prudential Committee responsible "for seeing that no part of their contributions goes for the propagation of error, either in doctrine or practice," and said that the Prudential Committee had long been governed by this principle. It had considered the doctrine of future probation as erroneous and dangerous in its tendency. The action of the board itself at its last annual meeting, at Des Moines, indicated a coincidence with this view. The Prudential Committee had in its examinations of candidates manifested an earnest desire to secure the services of able and cultivated men, and deserved high commendation for its faithfulness in this part of the work; while in those cases in which the candidates failed to receive appointments, the result was the only one consistent with the action of the board concerning missionary appointments at its last annual meeting. To this report were appended resolutions declaring—

That the board adheres to the position taken at the last annual meeting at Des Moines concerning the doctrine of future probation, reaffirms its utterances made at that time, and accepts the interpretation of the Prudential Committee as the true interpretation of its action. And that we recommend to the Prudential Committee an unabated carefulness in guarding the board from any committal to the approval of that doctrine.

The minority report denied that the American Board was a representative body of the churches, or possessed of the functions of a synod, and held that it was not competent to fix the standards of doctrinal faith to which its missionaries should conform. "That is a work which must be done, if it is done at all, by ecclesiastical assemblies, authorized by the churches to undertake so difficult and responsible a work." The board, under its present constitution, should refrain from sending to the Prudential Committee specific doctrinal instructions either on one side or the other of existing doctrinal controversies. This report concluded with resolutions reaffirming the position that neither the board nor the Prudential Committee was in any sense a theological court to settle doctrinal points of belief; that the board would have its missionaries always remember that they are sent to preach and teach these essential truths of Christianity in which all evangelical bodies mainly agree; that—

The missionaries of this board shall have the same right of private judgment in the interpretation of God's word, and the same freedom of thought and of speech as are enjoyed by their ministerial brethren in this country. In the exercise of their rights they should have constant and careful regard to the work of their associates, and to the harmony and effectiveness of the missions in which they labor. And all persons, otherwise well qualified, are to be regarded as acceptable candidates for missionary appointment, who heartily receive the fundamental truths of the Gospel, held in common by the churches sustaining the board, and ascertained by their actual uses.

A full discussion was had of all the points involved in the controversy, at the end of which the majority report was adopted.

The Rev. R. S. Storrs, D. D., of Brooklyn, N. Y., was elected President of the Board, to succeed the Rev. Mark Hopkins, D. D., deceased.

Dr. Storrs accepted the office of president in a letter of the 31st of October, in which he said that the questions which had largely engrossed the attention of the board at its last two meetings appeared to him to be practically settled, so far as the board was concerned, certainly for a considerable time. The board had decided, by a majority so large that further opposition to the decision was not likely to be made, that it would continue to intrust the examination of candidates for its missionary service to its permanent committee, and that this committee was not to be guided as to the theological fitness of its candidates by the opinions of improvised councils. It had also decided, under circumstances of unusual impressiveness, that the theory of a probation

after death offering opportunities beyond the grave to attain by repentance eternal life, is, at any rate, not a constituent part of the gospel of Christ, to be a portion of the message sent by this society to mankind. This question also must, therefore, be considered as practically retired from further debate at the annual sessions of the board, at least for years to come, and "remitted to that general and legitimate outside debate which never ceases in books, essays, articles, sermons, in church conferences, and local associations. . . . Nothing could be more conspicuously absurd than to expect the board, in its corporate action, to authorize a theory which most of its members thus far believe to be only an attractive, but a delusive, human speculation, with no basis in the Scriptures, and forming no part" of the Divine Message. It would not be wise, in the writer's judgment, "to allow altogether the same latitude of opinion among those representing all our churches in the missionary field, which is allowed, whether properly or not, by local churches in our own country to those who transiently minister in them." No further discussions of these questions in the board would be proper until the views of a majority of its members upon them should have been essentially modified.

American Missionary Association.—The forty-first annual meeting of the American Missionary Association was held in Portland, Me., beginning October 25.

The receipts of the association for the year had been \$306,761, and its expenditures, \$304,507, of which there had been applied to missionary work, in the South, \$107,768; among the Chinese, \$7,565; in the Indian missions and schools, \$47,920; and for purposes of foreign missions, \$5,120. Adding to the amount of receipts given above what had been contributed for special objects and the receipts of Berea College, Hampton Normal and Agricultural Institute, and Atlanta University, the entire amount of contributions for the general work in which the association is engaged was \$426,589. A debt of \$5,788 had been paid, and a credit balance of \$2,198 had accrued. Fifty-four schools were sustained in the Southern States, having 246 instructors and 8,616 pupils. Six of them were chartered institutions, or colleges; 16 normal and training schools, and 32 common schools, distributed in nine States. Three new school buildings and two buildings for industrial training had been erected during the year. Industrial training occupied a place of growing importance, and included farming, tinning, blacksmithing, wagon-making, carpenter's work, painting, and the use of steam-power, for boys; and domestic work for girls. In the department of church work in the South were returned 127 churches, 103 missionaries, 7,896 church-members, and 15,109 pupils in Sunday-schools. The amount of contributions for church purposes and benevolence had been \$18,337. The

"mountain work" included two fields; one in Kentucky, having for its base the Louisville and Nashville Railroad, and one along the Cumberland mountains in Tennessee, extending back from the Cincinnati Southern Railroad. In both districts were five schools and twelve churches. The Indian work of the association was chiefly in Nebraska and Dakota, and was represented by five churches, with 61 missionaries and teachers, and 370 members, and eighteen schools with 608 pupils. The "Chinese work" included seventeen missions, with 28 missionaries and an enrollment of 1,044 pupils. A foreign missionary society had been organized among the Chinese brethren in California; and a beginning of work had been made among the Japanese in that State. The association has ceased to be directly engaged in foreign mission work, but it contributes to the support of the Mendi Mission in Africa, which it formerly conducted, but which is now under the charge of the society of the United Brethren in Christ.

Congregational Union of England and Wales.—The annual meeting of the Congregational Union of England and Wales was held in London, beginning May 9. The Rev. Dr. Bruce, of Huddersfield, was elected chairman for the ensuing year. The report of the secretary said that the accounts of the Union showed an adverse balance for the year. The Jubilee fund now reached £400,000. The report further gave accounts of various matters that had been acted upon or were awaiting action. Among them were new plans for electing the chairman of the Union, and for insuring a better method of ministerial settlements; the examinations of young people in religious knowledge, which had not been taken up in the way that had been hoped, but in which another attempt was to be made, with a more limited number of subjects; a conference to be held with the Baptists in July concerning home mission work in England; the movement in behalf of social purity; the want of success in the effort to come to an agreement with the Presbyterians with reference to the De Foe Church at Tooting; the Marriage Registration Bill; the new hymnal, which was to be ready in June; and the ecclesiastical history by Dr. Dale, which was to be brought out on the author's own account, but for which the churches were asked to furnish exact statistics. A special committee on the election of a chairman had proposed a plan for the publication, at least fourteen days before the day for balloting, of the names of candidates approved by at least twenty members, but the Union decided not to interfere for the present with the existing method of electing the chairman. For facilitating the settlement of pastors the Union recommended that an educational tractate respecting the election of ministers be published, copies of which should be sent to vacant churches, and advised the appointment of confidential committees in aid of settlements by the country associations.

The judgment of the Assembly was expressed in favor of the formation of a young mens' guild in connection with the Congregational churches of the country, for the promotion of purity of life, and for other purposes connected with the moral welfare of the community and the prosperity of the churches; and the committee of the Union was instructed to appoint a special committee to draft a scheme for such guild, and report upon the subject to the autumnal meetings of the Union. A resolution was adopted against "coercion" in Ireland.

The autumnal meetings of the Congregational Union were held in Leeds, beginning October 11. The Rev. Alexander McKennal, D.D., presided, and delivered an opening address on "The Decay of Dogma" in the present time, for which he said a spiritual rather than a philosophical reason should be sought. Many of the doctrines professedly held in the churches a generation since had ceased to represent their real beliefs. An altered type of piety had come in which was simpler and more direct than it had been, franker in the utterance of personal experience and personal conviction, and building less on conviction and logic. The final report of the Jubilee fund showed that the total receipts on its account had been £430,000, while the payments had been about £4,800 less. The balance was almost exclusively appropriated as a reserve fund for the Church Aid Society. The amounts expended had been: For the liquidation of church debts, £246,225; for church aid and home mission work, £35,324; for Congregational church extension in London, £92,000; for various societies, £4,540; for colleges and schools, £20,218; for new churches and school-rooms, £22,370; for an old debt on the Memorial Hall, £1,000. The working expenses were £2,046; toward these the Congregational Union had voted £1,000, and the rest had been obtained from interest on investments, so that the contributors had the well-nigh unique privilege of knowing that every shilling they had subscribed had been devoted to the purpose desired. The Australian colonies had raised a Jubilee fund for similar purposes. New South Wales £40,000 for chapel debts. Victoria £20,300; and South Australia £14,430. The addition of these sums made a total of more than half a million pounds (£504,730) as the result of this special effort. Addresses were made and papers read during the sessions on "The Desirableness of County Conferences for the Revival of Faith, and Piety in the Churches," by Mr. Guest; "The Present Aspects of the Question of Church Comprehension," by the Rev. Samuel Pearson; "The Exposition and Enforcement of Free Church Principles" (a general discussion, embracing the subjects of "The Scriptural Ideal of Church Life," by the Rev. W. P. Clarkson; "The Congregational Idea of Church Life," by the Rev. R. H. Lovell, and "John Milton as a Free Churchman," by the Rev. Dr. Fairbairn); "The Great Need of Pastoral Oversight of the

Young," by the Rev. W. Spensley; "The Importance of Making Systematic Arrangements for the Scientific Study of Theology," by Prof. Wilkins; and "The Necessity for Maintaining the Christian Spirit in Political Conduct," by the Rev. Carvell Williams. Mr. R. S. Ashton, who was deputed to represent the Free Churches of France, informed the Union that there were now 88 of these churches, comprising more than 8,000 members. At the annual meeting of the Total Abstinence Association, which was held on the evening preceding the opening session of the Union, it was reported that of the Congregational ministers in England and Wales, the abstainers outnumber the non-abstainers by 400, and that of 375 students in Congregational colleges, 315 were abstainers.

Congregational Chapel-Building Society.—The report of the Congregational Chapel-Building Society, which was made in May, covered the work of 33 years. The total receipts during that time had been £169,577, and the total expenditures £161,842. The society had aided 667 churches and 38 mansees, representing property valued at about £1,800,000, for the most part freehold, and to a large extent free from interest-bearing debt. The churches provided 300,000 sittings. The society was possessed of available funds, promissory notes, and investments, amounting to £20,000.

Church Aid and Home Mission Society.—The annual meeting of the Church Aid and Home Mission Society was held May 10. The receipts of the society for the year had been £34,978. Aid had been given to 706 churches and branch churches, and 419 mission stations, or 1125 congregations in all. These congregations were under the care of 518 pastors and 108 missionaries and pastor evangelists, and returned 85,908 attendants, of whom 32,842 were church-members, with 74,200 pupils in Sunday-schools. They had raised for ministerial support, etc., £50,000, had received from public funds £5,894, and had been aided by the society to the extent of £26,246.

London Missionary Society.—The ninety-third annual meeting of the London Missionary Society was held in London May 12. The year's income had been £105,380, of which £9,000 had been contributed by the native mission churches. The expenditure left a deficit of nearly £15,000. Besides the ordinary staff of missionaries, 1,150 ordained native workers and 6,000 catechists and preachers were employed in the service of the missions. The report noticed as events favorable to the missions the issue of an imperial edict in China, recognizing the status of Chinese Christians, and a movement in Bengal and Madras to form a native Christian Church.

Irish Congregational Union.—The fifty-eighth annual meeting of the Irish Congregational Union was held at Sligo in May. Nearly every church had made advance during the year. A scheme for the establishment of a Theological hall in Belfast was considered.

CONGRESS OF THE UNITED STATES. The second session of the Forty-ninth Congress convened Dec. 6, 1886, and President Cleveland sent in his second annual message, as follows:

To the Congress of the United States:

In discharge of a constitutional duty, and following a well-established precedent in the Executive office, I herewith transmit to the Congress at its reassembling, certain information concerning the state of the Union, together with such recommendations for legislative consideration as appear necessary and expedient.

Our Government has consistently maintained its relations of friendship toward all other powers, and of neighborly interest toward those whose possessions are contiguous to our own. Few questions have arisen during the past year with other governments, and none of those are beyond the reach of settlement in friendly counsel.

We are as yet without provision for the settlement of claims of citizens of the United States against Chili for injuries during the late war with Peru and Bolivia. The mixed commissions, organized under claims conventions, concluded by the Chilean Government with certain European states, have developed an amount of friction which we trust can be avoided in the convention which our representative at Santiago is authorized to negotiate.

The cruel treatment of inoffensive Chinese has, I regret to say, been repeated in some of the far Western States and Territories, and acts of violence against those people, beyond the power of the local constituted authorities to prevent, and difficult to punish, are reported even in distant Alaska. Much of this violence can be traced to race prejudice and competition of labor, which can not, however, justify the oppression of strangers whose safety is guaranteed by our treaty with China equally with the most favored nations.

In opening our vast domain to alien elements, the purpose of our lawgivers was to invite assimilation, and not to provide an arena for endless antagonisms. The paramount duty of maintaining public order and defending the interests of our own people may require the adoption of measures of restriction, but they should not tolerate the oppression of individuals of a special race. I am not without assurance that the Government of China, whose friendly disposition toward us I am most happy to recognize, will meet us half-way in devising a comprehensive remedy, by which an effective limitation of Chinese emigration, joined to protection of those Chinese subjects who remain in this country, may be secured.

Legislation is needed to execute the provisions of our Chinese convention of 1880 touching the opium-traffic.

While the good-will of the Colombian Government toward our country is manifest, the situation of American interests on the Isthmus of Panama has at times excited concern, and invited friendly action looking to the performance of the engagements of the two nations concerning the territory embraced in the interoceanic transit. With the subsidence of the Isthmian disturbances, and the erection of the State of Panama into a Federal district under the direct government of the constitutional administration of Bogotá, a new order of things has been inaugurated which, although as yet somewhat experimental and affording scope for arbitrary exercise of power by the delegates of the national authority, promises much improvement.

The sympathy between the people of the United States and France, born during our colonial struggle for independence and continuing to-day, has received a fresh impulse in the successful completion and dedication of the colossal statue of "Liberty Enlightening the World" in New York Harbor—the gift of Frenchmen to Americans.

A convention between the United States and certain other powers for the protection of submarine cables was signed at Paris on March 14, 1884, and has been duly ratified and proclaimed by this Government. By agreement between the high contracting parties this convention is to go into effect on the 1st of January next, but the legislation required for its execution in the United States has not yet been adopted. I earnestly recommend its enactment.

Cases have continued to occur in Germany giving rise to much correspondence in relation to the privilege of sojourn of our naturalized citizens of German origin revisiting the land of their birth, yet I am happy to state that our relations with that country have lost none of their accustomed cordiality.

The claims for interest upon the amount of tonnage dues illegally exacted from certain German steamship lines were favorably reported in both houses of Congress at the last session, and I trust will receive final and favorable action at an early day.

The recommendations contained in my last annual message in relation to a mode of settlement of the fishery rights in the waters of British North America—so long a subject of anxious difference between the United States and Great Britain—was met by an adverse vote of the Senate on April 18th last; and thereupon negotiations were instituted to obtain an agreement with Her Britannic Majesty's Government for the promulgation of such joint interpretation and definition of the article of the Convention of 1818, relating to the territorial waters and inshore fisheries of the British provinces, as should secure the Canadian rights from encroachment by United States fishermen, and, at the same time, insure the enjoyment by the latter of the privileges guaranteed to them by such convention.

The questions involved are of long standing, of grave consequence, and from time to time, for nearly three quarters of a century, have given rise to earnest international discussions, not unaccompanied by irritation.

Temporary arrangements by treaties have served to allay friction—which, however, has revived as each treaty was terminated. The last arrangement, under the treaty of 1871, was abrogated after due notice by the United States on June 30, 1885, but I was enabled to obtain for our fishermen for the remainder of that season enjoyment of the full privileges accorded by the terminated treaty.

The Joint High Commission by whom the treaty had been negotiated—although invested with plenary power to make a permanent settlement—were content with a temporary arrangement, after the termination of which the question was relegated to the stipulations of the Treaty of 1818, as to the first article of which no construction satisfactory to both countries has ever been agreed upon.

The progress of civilization and growth of population in the British provinces to which the fisheries in question are contiguous, and the expansion of commercial intercourse between them and the United States, present to-day a condition of affairs scarcely realizable at the date of the negotiations of 1818.

New and vast interests have been brought into existence; modes of intercourse between the respective countries have been invented and multiplied; the methods of conducting the fisheries have been wholly changed; and all this is necessarily entitled to candid and careful consideration in the adjustment of the terms and conditions of intercourse and commerce between the United States and their neighbors along a frontier of over 3,500 miles.

This propinquity, community of language and occupation, and similarity of political and social institutions indicate the practicability and obvious wisdom of maintaining mutually beneficial and friendly relations.

While I am unfeignedly desirous that such relations should exist between us and the inhabitants of Canada, yet the action of their officials during the past season

toward our fishermen has been such as to seriously threaten their continuance.

Although disappointed in my efforts to secure a satisfactory settlement of the fishery question, negotiations are still pending, with reasonable hope that before the close of the present session of Congress announcement may be made that an acceptable conclusion has been reached.

As at an early day there may be laid before Congress the correspondence of the Department of State in relation to this important subject, so that the history of the past fishing season may be fully disclosed and the action and the attitude of the Administration clearly comprehended, a more extended reference is not deemed necessary in this communication.

The recommendation, submitted last year, that provision be made for a preliminary reconnaissance of the conventional boundary-line between Alaska and British Columbia is renewed.

I express my unhesitating conviction that the intimacy of our relations with Hawaii should be emphasized. As a result of the reciprocity treaty of 1875, those islands, on the highway of Oriental and Australasian traffic, are virtually an outpost of American commerce and a stepping-stone to the growing trade of the Pacific. The Polynesian island groups have been so absorbed by other and more powerful governments, that the Hawaiian Islands are left almost alone in the enjoyment of their autonomy, which it is important for us should be preserved. Our treaty is now terminable on one year's notice, but propositions to abrogate it would be, in my judgment, most ill-advised. The paramount influence we have there acquired, once relinquished, could only with difficulty be regained, and a valuable ground of vantage for ourselves might be converted into a stronghold for our commercial competitors. I earnestly recommend that the existing treaty stipulations be extended for a further term of seven years. A recently-signed treaty to this end is now before the Senate.

The importance of telegraphic communication between those islands and the United States should not be overlooked.

The question of a general revision of the treaties of Japan is again under discussion at Tokio. As the first to open relations with that empire, and as the nation in most direct commercial relation with Japan, the United States have lost no opportunity to testify their consistent friendship by supporting the just claims of Japan to autonomy and independence among nations.

A treaty of extradition between the United States and Japan, the first concluded by that empire, has been lately proclaimed.

The weakness of Liberia, and the difficulty of maintaining effective sovereignty over its outlying districts, have exposed that republic to encroachment. It can not be forgotten that this distant community is an offshoot of our own system, owing its origin to the associated benevolence of American citizens, whose praiseworthy efforts to create a nucleus of civilization in the dark continent have commanded respect and sympathy everywhere, especially in this country. Although a formal protectorate over Liberia is contrary to our traditional policy, the moral right and duty of the United States to assist in all proper ways in the maintenance of its integrity is obvious, and has been consistently announced during nearly half a century. I recommend that, in the reorganization of our navy, a small vessel, no longer found adequate to our needs, be presented to Liberia, to be employed by it in the protection of its coastwise revenues.

The encouraging development of beneficial and intimate relations between the United States and Mexico, which has been so marked within the past few years, is at once the occasion of congratulation and of friendly solicitude. I urgently renew my former representation of the need of speedy legislation by Congress to carry into effect the Reciprocity Commercial Convention of January 20, 1888.

Our commercial treaty of 1881 with Mexico was terminated, according to its provisions, in 1881, upon notification given by Mexico in pursuance of her announced policy of recasting all her commercial treaties. Mexico has since concluded with several foreign governments new treaties of commerce and navigation, defining alien rights of trade, property, and residence, treatment of shipping, consular privileges, and the like. Our yet unexecuted Reciprocity Convention of 1883 covers none of these points, the settlement of which is so necessary to good relationship. I propose to initiate with Mexico negotiations for a new and enlarged treaty of commerce and navigation.

In compliance with a resolution of the Senate, I communicated to that body on August 2 last, and also to the House of Representatives, the correspondence in the case of A. K. Cutting, an American citizen, then imprisoned in Mexico, charged with the commission of a penal offense in Texas, of which a Mexican citizen was the object.

After demand had been made for his release, the charge against him was amended so as to include a violation of Mexican law within Mexican territory.

This joinder of alleged offenses, one within and the other exterior to Mexico, induced me to order a special investigation of the case—pending which Mr. Cutting was released.

The incident has, however, disclosed a claim of jurisdiction by Mexico, novel in our history, whereby any offense, committed anywhere by a foreigner, penal in the place of its commission, and of which a Mexican is the object, may, if the offender be found in Mexico, be there tried and punished in conformity with Mexican laws.

This jurisdiction was sustained by the courts of Mexico in the Cutting case, and approved by the executive branch of that Government, upon the authority of a Mexican statute. The appellate court, in releasing Mr. Cutting, decided that the abandonment of the complaint by the Mexican citizen aggrieved by the alleged crime (a libelous publication), removed the basis of further prosecution, and also declared justice to have been satisfied by the enforcement of a small part of the original sentence.

The admission of such a pretension would be attended with serious results, invasive of the jurisdiction of this Government, and highly dangerous to our citizens in foreign lands; therefore I have denied it, and protested against its attempted exercise, as unwarranted by the principles of law and international usages.

A sovereign has jurisdiction of offenses which take effect within his territory, although concocted or commenced outside of it; but the right is denied of any foreign sovereign to punish a citizen of the United States for an offense consummated on our soil in violation of our laws, even though the offense be against a subject or citizen of such sovereign. The Mexican statute in question makes the claim broadly, and the principle, if conceded, would create a dual responsibility in the citizen, and lead to inextricable confusion, destructive of that certainty in the law which is an essential of liberty.

When citizens of the United States voluntarily go into a foreign country they must abide by the laws there in force, and will not be protected by their own Government from the consequences of an offense against those laws committed in such foreign country; but watchful care and interest of this Government over its citizens are not relinquished because they have gone abroad; and if charged with crime committed in the foreign land, a fair and open trial, conducted with decent regard for justice and humanity, will be demanded for them. With less than that this Government will not be content when the life or liberty of its citizens is at stake.

Whatever the degree to which extra-territorial criminal jurisdiction may have been formerly allowed by consent and reciprocal agreement among certain of the European states, no such doctrine or practice

was ever known to the laws of this country, or of that from which our institutions have mainly been derived.

In the case of Mexico there are reasons especially strong for perfect harmony in the mutual exercise of jurisdiction. Nature has made us irrevocably neighbors, and wisdom and kind feeling should make us friends.

The overflow of capital and enterprise from the United States is a potent factor in assisting the development of the resources of Mexico, and in building up the prosperity of both countries.

To assist this good work all grounds of apprehension for the security of person and property should be removed; and I trust that in the interests of good neighborhood the statute referred to will be so modified as to eliminate the present possibilities of danger to the peace of the two countries.

The Government of the Netherlands has exhibited concern in relation to certain features of our tariff laws, which are supposed by them to be aimed at a class of tobacco produced in the Dutch East Indies. Comment would seem unnecessary upon the unwisdom of legislation appearing to have a special national discrimination for its object, which, although unintentional, may give rise to injurious retaliation.

The establishment, less than four years ago, of a legation at Teheran is bearing fruit in the interest exhibited by the Shah's Government in the industrial activity of the United States and the opportunities of beneficial interchanges.

Stable government is now happily restored in Peru by the election of a constitutional President, and a period of rehabilitation is entered upon. But the recovery is necessarily slow from the exhaustion caused by the late war, and civil disturbances. A convention to adjust, by arbitration, claims of our citizens has been proposed, and is under consideration.

The naval officer who bore to Siberia the testimonials bestowed by Congress in recognition of the aid given to the Jeannette survivors, has successfully accomplished his mission. His interesting report will be submitted. It is pleasant to know that this mark of appreciation has been welcomed by the Russian Government and people as befits the traditional friendship of the two countries.

Civil perturbations in the Samoan Islands have during the past few years been a source of considerable embarrassment to the three governments, Germany, Great Britain, and the United States, whose relations and extra-territorial rights in that important group are guaranteed by treaties. The weakness of the native administration and the conflict of opposing interests in the islands have led King Malletoa to seek alliance or protection in some one quarter, regardless of the distinct engagements whereby no one of the three treaty powers may acquire any paramount or exclusive interest. In May last Malletoa offered to place Samoa under the protection of the United States, and the late consul, without authority, assumed to grant it. The proceeding was promptly disavowed, and the over-zealous official recalled. Special agents of the three governments have been deputed to examine the situation in the islands. With a change in the representation of all three powers, and a harmonious understanding between them, the peace, prosperity, autonomous administration, and neutrality of Samoa can hardly fail to be secured.

It appearing that the Government of Spain did not extend to the flag of the United States in the Antilles the full measure of reciprocity requisite under our statute for the continuance of the suspension of discriminations against the Spanish flag in our ports, I was constrained in October last to rescind my predecessor's proclamation of Feb. 14, 1884, permitting such suspension. An arrangement was, however, speedily reached, and upon notification from the Government of Spain that all differential treatment of our vessels and their cargoes, from the United States or any foreign country, had been completely and ab-

solutely relinquished, I availed myself of the discretion conferred by law, and issued on the 27th of October my proclamation, declaring reciprocal suspension in the United States. It is most gratifying to bear testimony to the earnest spirit in which the Government of the Queen Regent has met our efforts to avert the initiation of commercial discriminations and reprisals, which are ever disastrous to the material interests and the political good-will of the countries they may affect.

The profitable development of the large commercial exchanges between the United States and the Spanish Antilles is naturally an object of solicitude. Lying close at our doors, and finding here their main markets of supply and demand, the welfare of Cuba and Porto Rico, and their production and trade, are scarcely less important to us than to Spain. Their commercial and financial movements are so naturally a part of our system that no obstacle to fuller and freer intercourse should be permitted to exist. The standing instructions of our representatives at Madrid and Havana have for years been to leave no effort untried to further these ends; and at no time has the equal good desire of Spain been more hopefully manifested than now.

The Government of Spain, by removing the consular tonnage fees on cargoes shipped to the Antilles, and by reducing passport fees, has shown its recognition of the needs of less trammelled intercourse.

An effort has been made during the past year to remove the hindrances to the proclamation of the treaty of naturalization with the Sublime Porte, signed in 1874, which has remained inoperative owing to a disagreement of interpretation of the clauses relative to the effects of the return to and sojourn of a naturalized citizen in the land of origin. I trust soon to be able to announce a favorable settlement of the differences as to this interpretation.

It has been highly satisfactory to note the improved treatment of American missionaries in Turkey, as has been attested by their acknowledgments to our late minister to that Government of his successful exertions in their behalf.

The exchange of ratifications of the convention of Dec. 5, 1885, with Venezuela, for the reopening of the awards of the Caracas Commission under the Claims Convention of 1866, has not yet been effected, owing to the delay of the Executive of that republic in ratifying the measure. I trust that this postponement will be brief; but should it much longer continue, the delay may well be regarded as a rescission of the compact and a failure on the part of Venezuela to complete an arrangement so persistently sought by her during many years and assented to by this Government in a spirit of international fairness, although to the detriment of holders of *bona-fide* awards of the impugned commission.

I renew the recommendation of my last annual message, that existing legislation concerning citizenship and naturalization be revised. We have treaties with many states providing for the renunciation of citizenship by naturalized aliens, but no statute is found to give effect to such engagements, nor any which provides a needed central bureau for the registration of naturalized citizens.

Experience suggests that our statutes regulating extradition might be advantageously amended by a provision for the transit across our territory, now a convenient thoroughfare of travel from one foreign country to another, of fugitives surrendered by a foreign government to a third state. Such provisions are not unusual in the legislation of other countries, and tend to prevent the miscarriage of justice. It is also desirable, in order to remove present uncertainties, that authority should be conferred on the Secretary of State to issue a certificate in case of an arrest for the purpose of extradition, to the officer before whom the proceeding is pending, showing that a requisition for the surrender of the person charged has been duly made. Such a certificate, if required to be received

before the prisoner's examination, would prevent a long and expensive judicial inquiry into a charge which the foreign government might not desire to press. I also recommend that express provision be made for the immediate discharge from custody of persons committed for extradition where the President is of opinion that surrender should not be made.

The drift of sentiment in civilized communities toward full recognition of the rights of property in the creations of the human intellect has brought about the adoption, by many important nations, of an International Copyright Convention, which was signed at Berne on the 18th of September, 1885.

Inasmuch as the Constitution gives to Congress the power "to promote the progress of science and useful arts by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries," this Government did not feel warranted in becoming a signatory pending the action of Congress upon measures of international copyright now before it, but the right of adhesion to the Berne Convention hereafter, has been reserved. I trust the subject will receive at your hands the attention it deserves, and that the just claims of authors, so urgently pressed, will be duly heeded.

Representations continue to be made to me of the injurious effect upon American artists studying abroad and having free access to the art collections of foreign countries, of maintaining a discriminating duty against the introduction of the works of their brother artists of other countries; and I am induced to repeat my recommendation for the abolition of that tax.

Pursuant to a provision of the diplomatic and consular appropriation act, approved July 1, 1886, the estimates submitted by the Secretary of State for the maintenance of the consular service have been recast, on the basis of salaries for all officers to whom such allowance is deemed advisable. Advantage has been taken of this to redistribute the salaries of the offices now appropriated for, in accordance with the work performed, the importance of the representative duties of the incumbent, and the cost of living at each post. The last consideration has been too often lost sight of in the allowances heretofore made. The compensation which may suffice for the decent maintenance of a worthy and capable officer in a position of onerous and representative trust at a post readily accessible, and where the necessities of life are abundant and cheap, may prove an inadequate pittance in distant lands, where the better part of a year's pay is consumed in reaching the post of duty, and where the comforts of ordinary civilized existence can only be obtained with difficulty and at exorbitant cost. I trust that, in considering the submitted schedules, no mistaken theory of economy will perpetuate a system which in the past has virtually closed to deserving talent many offices where capacity and attainments of a high order are indispensable, and in not a few instances has brought discredit on our national character and entailed embarrassment and even suffering on those deputed to uphold our dignity and interests abroad.

In connection with this subject I earnestly reiterate the practical necessity of supplying some mode of trustworthy inspection and report of the manner in which the consulates are conducted. In the absence of such reliable information, efficiency can scarcely be rewarded, or its opposite corrected.

Increasing competition in trade has directed attention to the value of consular reports printed by the Department of State, and the efforts of the Government to extend the practical usefulness of these reports have created a wider demand for them at home and a spirit of emulation abroad. Constituting a record of the changes occurring in trade and of the progress of the arts and invention in foreign countries, they are much sought for by all interested in the subjects which they embrace.

The report of the Secretary of the Treasury exhibits in detail the condition of the public finances and of

the several branches of the Government related to his department. I especially direct the attention of the Congress to the recommendations contained in this and the last preceding report of the Secretary, touching the simplification and amendment of the laws relating to the collection of our revenues; and in the interest of economy and justice to the Government, I hope they may be adopted by appropriate legislation.

The ordinary receipts of the Government for the fiscal year ended June 30, 1886, were \$336,439,727.06. Of this amount \$192,906,023.41 was received from customs and \$116,806,936.48 from internal revenue. The total receipts, as here stated, were \$13,749,020.68 greater than for the previous year, but the increase from customs was \$11,434,084.10, and from internal revenue \$4,407,910.94, making a gain in these items for the last year of \$15,841,995.04—a falling off in other resources reducing the total increase to the smaller amount mentioned.

The expense, at the different custom-houses, of collecting this increased customs revenue was less than the expense attending the collection of such revenue for the preceding year by \$490,608; and the increased receipts of internal revenue were collected at a cost to the Internal Revenue Bureau \$156,944.99 less than the expense of such collection for the previous year.

The total ordinary expenses of the Government for the fiscal year ended June 30, 1886, were \$242,483,188.60, being less by \$17,788,797 than such expenditures for the year preceding, and leaving a surplus in the Treasury at the close of the last fiscal year of \$98,956,588.56 as against \$63,463,771.27 at the close of the previous year, being an increase in such surplus of \$35,492,817.29.

The expenditures are compared with those of the preceding fiscal year, and classified as follow:

OBJECT.	Year ending June 30, 1886.	Year ending June 30, 1885.
For civil expenses.....	\$21,955,604 04	\$28,636,949 11
For foreign intercourse.....	1,332,320 68	5,439,609 11
For Indians.....	6,099,158 17	6,552,494 68
For pensions.....	68,404,564 08	56,102,267 49
For the military, including river and harbor improve- ments and arsenals.....	34,324,152 74	42,670,575 47
For the navy, including ves- sels, machinery, and im- provement of navy-yards...	13,907,887 74	14,021,079 69
For interest on public debt...	50,680,145 97	51,856,256 47
For the District of Columbia.	2,592,321 89	2,469,650 95
Miscellaneous expenditures, including public buildings, lighthouses, and collecting the revenue.....	47,966,638 04	54,728,066 21

For the current year to end June 30, 1887, the ascertained receipts up to Oct. 1, 1886, with such receipts estimated for the remainder of the year, amount to \$356,000,000.

The expenditures ascertained and estimated for the same period are \$266,000,000, indicating an anticipated surplus at the close of the year of \$90,000,000.

The total value of the exports from the United States to foreign countries during the fiscal year is stated and compared with the preceding year as follows:

EXPORTS.	For the year end- ing June 30, 1886.	For the year end- ing June 30, 1885.
Domestic merchandise...	\$665,964,529 00	\$796,632,346 00
Foreign merchandise...	13,560,801 00	15,508,909 00
Gold.....	42,952,191 00	8,477,992 00
Silver.....	29,511,219 00	33,753,688 00

The value of some of our leading exports during the last fiscal year, as compared with the value of the same for the year immediately preceding, is here given, and furnishes information both interesting and suggestive:

EXPORTS.	For the year ending June 30, 1894.	For the year ending June 30, 1893.
Cotton and cotton manufactures.....	\$319,045,576 00	\$318,799,049 00
Tobacco and its manufactures.....	30,424,908 00	24,767,805 00
Breadstuffs.....	125,844,858 00	180,870,821 00
Provisions.....	90,626,316 00	107,592,456 00

Our imports during the last fiscal year, as compared with the previous year, were as follow :

IMPORTS.	1894.	1893.
Merchandise.....	\$685,436,184 00	\$579,590,058 80
Gold.....	20,743,349 00	24,691,696 00
Silver.....	17,860,807 00	16,550,627 00

In my last annual message to the Congress attention was directed to the fact that the revenues of the Government exceeded its actual needs; and it was suggested that legislative action should be taken to relieve the people from the unnecessary burden of taxation thus made apparent.

In view of the pressing importance of the subject I deem it my duty to again urge its consideration.

The income of the Government, by its increased volume and through economies in its collection, is now more than ever in excess of public necessities. The application of the surplus to the payment of such portion of the public debt as is now at our option subject to extinguishment, if continued at the rate which has lately prevailed, would retire that class of indebtedness within less than one year from this date. Thus a continuation of our present revenue system would soon result in the receipt of an annual income much greater than necessary to meet Government expenses, with no indebtedness upon which it could be applied. We should then be confronted with a vast quantity of money, the circulating medium of the people, hoarded in the Treasury when it should be in their hands, or we should be drawn into wasteful public extravagance with all the corrupting national demoralization which follows in its train.

But it is not the simple existence of this surplus and its threatened attendant evils, which furnish the strongest argument against our present scale of Federal taxation. Its worst phase is the exaction of such a surplus through a perversion of the relations between the people and their Government, and a dangerous departure from the rules which limit the right of Federal taxation.

Good government, and especially the government of which every American citizen boasts, has for its objects the protection of every person within its care in the greatest liberty consistent with the good order of society, and his perfect security in the enjoyment of his earnings, with the least possible diminution for public needs. When more of the people's substance is exacted through the form of taxation than is necessary to meet the just obligations of the Government and the expense of its economical administration, such exaction becomes ruthless extortion and a violation of the fundamental principles of a free government.

The indirect manner in which these exactions are made has a tendency to conceal their true character and their extent. But we have arrived at a stage of superfluous revenue which has aroused the people to a realization of the fact that the amount raised, professedly for the support of the Government, is paid by them as absolutely, if added to the price of the things which supply their daily wants, as if it was paid at fixed periods into the hand of the tax-gatherer.

Those who toil for daily wages are beginning to understand that capital, though sometimes vaunting its importance and clamoring for the protection and favor of the Government, is dull and sluggish, till, touched by the magical hand of labor, it springs into activity, furnishing an occasion for Federal taxation and gain-

ing the value which enables it to bear its burden. And the laboring-man is thoughtfully inquiring whether in these circumstances, and considering the tribute he constantly pays into the public Treasury as he supplies his daily wants, he receives his fair share of advantages.

There is also a suspicion abroad that the surplus of our revenues indicates abnormal and exceptional business profits, which, under the system which produces such surplus, increase without corresponding benefit to the people at large, the vast accumulations of a few among our citizens whose fortunes, rivaling the wealth of the most favored in anti-democratic nations, are not the natural growth of a steady, plain, and industrious republic.

Our farmers too, and those engaged directly and indirectly in supplying the products of agriculture, see that day by day, and as often as the daily wants of their households recur, they are forced to pay excessive and needless taxation, while their products struggle in foreign markets with the competition of nations, which, by allowing a freer exchange of productions than we permit, enable their people to sell for prices which distress the American farmer.

As every patriotic citizen rejoices in the constantly increasing pride of our people in American citizenship and in the glory of our national achievements and progress, a sentiment prevails that the leading-strings useful to a nation in its infancy may well be to a great extent discarded in the present stage of American ingenuity, courage, and fearless self-reliance. And for the privilege of indulging this sentiment with true American enthusiasm, our citizens are quite willing to forego an idle surplus in the public Treasury.

And all the people know that the average rate of Federal taxation upon imports is to-day, in time of peace, but little less, while upon some articles of necessary consumption it is actually more, than was imposed by the grievous burden willingly borne, at a time when the Government needed millions to maintain by war the safety and integrity of the Union.

It has been the policy of the Government to collect the principal part of its revenues by a tax upon imports; and no change in this policy is desirable. But the present condition of affairs constrains our people to demand that, by a revision of our revenue laws, the receipts of the Government shall be reduced to the necessary expense of its economical administration; and this demand should be recognized and obeyed by the people's representatives in the legislative branch of the Government.

In readjusting the burdens of Federal taxation, a sound public policy requires that such of our citizens as have built up large and important industries under present conditions, should not be suddenly and to their injury deprived of advantages to which they have adapted their business; but if the public good requires it, they should be content with such consideration as shall deal fairly and cautiously with their interests, while the just demand of the people for relief from needless taxation is honestly answered.

A reasonable and timely submission to such a demand should certainly be possible without disastrous shock to any interest; and a cheerful concession sometimes averts abrupt and heedless action, often the outgrowth of impatience and delayed justice.

Due regard should be also accorded in any proposed readjustment to the interests of American labor so far as they are involved. We congratulate ourselves that there is among us no laboring-class fixed within unyielding bounds, and doomed under all conditions to the inexorable fate of daily toil. We recognize in labor a chief factor in the wealth of the republic, and we treat those who have it in their keeping as citizens entitled to the most careful regard and thoughtful attention. This regard and attention should be awarded them, not only because labor is the capital of our workingmen, justly entitled to its share of Government favor, but for the further and not less important reason that the laboring-man, surrounded by his fam-

ily in his humble home, as a consumer is vitally interested in all that cheapens the cost of living, and enables him to bring within his domestic circle additional comforts and advantages.

This relation of the workman to the revenue laws of the country, and the manner in which it palpably influences the question of wages, should not be forgotten in the justifiable prominence given to the proper maintenance of the supply and protection of well-paid labor. And these considerations suggest such an arrangement of Government revenues as shall reduce the expense of living, while it does not curtail the opportunity for work nor reduce the compensation of American labor, and injuriously affect its condition and the dignified place it holds in the estimation of our people.

But our farmers and agriculturists—those who from the soil produce the things consumed by all—are, perhaps, more directly and plainly concerned than any other of our citizens in a just and careful system of Federal taxation. Those actually engaged in and more remotely connected with this kind of work, number nearly one half of our population. None labor harder or more continuously than they. No enactments limit their hours of toil, and no interposition of the Government enhances to any extent the value of their products. And yet for many of the necessities and comforts of life, which the most scrupulous economy enables them to bring into their homes, and for their implements of husbandry, they are obliged to pay a price largely increased by an unnatural profit which, by the action of the Government, is given to the more favored manufacturer.

I recommend that, keeping in view all these considerations, the increasing and unnecessary surplus of national income annually accumulating be released to the people by an amendment to our revenue laws which shall cheapen the price of the necessities of life, and give freer entrance to such imported materials as by American labor may be manufactured into marketable commodities.

Nothing can be accomplished, however, in the direction of this much-needed reform, unless the subject is approached in a patriotic spirit of devotion to the interests of the entire country, and with a willingness to yield something for the public good.

The sum paid upon the public debt during the fiscal year ended June 30, 1886, was \$44,551,043.36.

During the twelve months ended Oct. 31, 1886, three-per-cent. bonds were called for redemption amounting to \$127,233,100, of which \$30,643,200 was so called to answer the requirements of the law relating to the sinking-fund, and \$48,639,900 for the purpose of reducing the public debt by application of a part of the surplus in the Treasury to that object. Of the bonds thus called \$102,269,450 became subject under such calls to redemption prior to Nov. 1, 1886. The remainder, amounting to \$25,013,650, matured under the calls after that date.

In addition to the amount subject to payment and cancellation prior to November 1, there were also paid before that day certain of these bonds, with the interest thereon, amounting to \$5,072,350, which were anticipated as to their maturity, of which \$2,664,850 had not been called. Thus \$107,341,800 had been actually applied prior to the 1st of November, 1886, to the extinguishment of our bonded and interest-bearing debt, leaving on that day still outstanding the sum of \$1,153,443,112. Of this amount \$86,848,700 were still represented by three-per-cent. bonds. They, however, have been, since November 1, or will at once be, further reduced by \$22,606,150, being bonds which have been called, as already stated, but not redeemed and canceled before the latter date.

During the fiscal year ended June 30, 1886, there were coined, under the compulsory silver-coinage act of 1873, 29,838,905 silver dollars, and the cost of the silver used in such coinage was \$23,448,980.01. There had been coined up to the close of the previous fiscal year under provisions of the law, 203,882,554 silver

dollars, and on the 1st day of December, 1886, the total amount of such coinage was \$247,131,549.

The Director of the Mint reports that at the time of the passage of the law of 1873 directing this coinage the intrinsic value of the dollars thus coined was ninety-four and one fourth cents each, and that on the 31st day of July, 1886, the price of silver reached the lowest stage ever known, so that the intrinsic or bullion price of our standard silver dollar at that date was less than seventy-two cents. The price of silver on the 30th day of November last was such as to make these dollars intrinsically worth seventy-eight cents each.

These differences in value of the coins represent the fluctuations in the price of silver, and they certainly do not indicate that compulsory coinage by the Government enhances the price of that commodity or secures uniformity in its value.

Every fair and legal effort has been made by the Treasury Department to distribute this currency among the people. The withdrawal of the United States Treasury notes of small denominations, and the issuing of small silver certificates have been resorted to in the endeavor to accomplish this result, in obedience to the will and sentiments of the representatives of the people in the Congress. On the 27th day of November, 1886, the people held of these coins, or certificates representing them, the nominal sum of \$166,873,041, and we still had \$79,464,345 in the Treasury—as against about \$142,894,055 so in the hands of the people, and \$72,865,376 remaining in the Treasury one year ago. The Director of the Mint again urges the necessity of more vault-room for the purpose of storing those silver dollars which are not needed for circulation by the people.

I have seen no reason to change the views expressed in my last annual message on the subject of this compulsory coinage, and I again urge its suspension on the grounds contained in my former recommendation, re-enforced by the significant increase of our gold exportations during the last year, as appears by the comparative statement herewith presented, and for the further reasons that the more this currency is distributed among the people the greater becomes our duty to protect it from disaster; that we now have abundance for all our needs; and that there seems but little propriety in building vaults to store such currency when the only pretense for its coinage is the necessity of its use by the people as a circulating medium.

The great number of suits now pending in the United States courts for the Southern District of New York, growing out of the collection of customs revenue at the port of New York, and the number of such suits that are almost daily instituted, are certainly worthy the attention of the Congress. These legal controversies, based upon conflicting views by importers and the collector as to the interpretation of our present complex and indefinite revenue laws, might be largely obviated by an amendment of those laws.

But, pending such amendment, the present condition of this litigation should be relieved. There are now pending about twenty-five hundred of these suits. More than eleven hundred have been commenced within the past eighteen months, and many of the others have been at issue for more than twenty-five years. These delays subject the Government to loss of evidence, and prevent the preparation necessary to defeat unjust and fictitious claims, while constantly accruing interest threatens to double the demands involved.

In the present condition of the dockets of the courts, well filled with private suits, and of the force allowed the district attorney, no greater than is necessary for the ordinary and current business of his office, these revenue litigations can not be considered.

In default of the adoption by the Congress of a plan for the general reorganization of the Federal courts, as has been heretofore recommended, I urge the propriety of passing a law permitting the appointment of

an additional Federal judge in the district where these Government suits have accumulated, so that by continuous sessions of the courts devoted to the trial of these cases they may be determined.

It is entirely plain that a great saving to the Government would be accomplished by such a remedy, and the suitors who have honest claims would not be denied justice through delay.

The report of the Secretary of War gives a detailed account of the administration of his department, and contains sundry recommendations for the improvement of the service, which I fully approve.

The army consisted at the date of the last consolidated return of 2,108 officers, and 24,946 enlisted men.

The expenses of the department for the last fiscal year were \$36,990,903.88, including \$6,294,805.43 for public works and river and harbor improvements.

I especially direct the attention of the Congress to the recommendation that officers be required to submit to an examination as a preliminary to their promotion. I see no objection, but many advantages, in adopting this feature, which has operated so beneficially in our Navy Department, as well as in some branches of the army.

The subject of coast defenses and fortifications has been fully and carefully treated by the Board on Fortifications, whose report was submitted at the last session of Congress; but no construction work of the kind recommended by the board has been possible during the last year, from the lack of appropriations for such purpose.

The defenseless condition of our sea-coast and lake frontier is perfectly palpable; the examinations made must convince us all that certain of our cities named in the report of the board should be fortified, and that work on the most important of these fortifications should be commenced at once; the work has been thoroughly considered and laid out, the Secretary of War reports, but all is delayed in default of congressional action.

The absolute necessity, judged by all standards of prudence and foresight, of our preparation for an effectual resistance against the armored ships and steel guns and mortars of modern construction which may threaten the cities on our coasts, is so apparent, that I hope effective steps will be taken in that direction immediately.

The valuable and suggestive treatment of this question by the Secretary of War is earnestly commended to the consideration of the Congress.

In September and October last the hostile Apaches who, under the leadership of Geronimo, had for eighteen months been on the war-path, and during that time had committed many murders, and been the cause of constant terror to the settlers of Arizona, surrendered to General Miles, the military commander who succeeded General Crook in the management and direction of their pursuit.

Under the terms of their surrender, as then reported, and in view of the understanding which these murderous savages seemed to entertain of the assurances given them, it was considered best to imprison them in such manner as to prevent their ever engaging in such outrages again, instead of trying them for murder. Fort Pickens having been selected as a safe place of confinement, all the adult males were sent thither, and will be closely guarded as prisoners. In the mean time the residue of the band, who, though still remaining upon the reservation, were regarded as unsafe, and suspected of furnishing aid to those on the war-path, had been removed to Fort Marion. The women and larger children of the hostiles were also taken there, and arrangements have been made for putting the children of proper age in Indian schools.

The report of the Secretary of the Navy contains a detailed exhibit of the condition of his department, with such a statement of the action needed to improve the same as should challenge the earnest attention of the Congress.

The present Navy of the United States, aside from the ships in course of construction, consists of—

First, fourteen single-turreted monitors, none of which are in commission, nor at the present time serviceable. The batteries of these ships are obsolete, and they can only be relied upon as auxiliary ships in harbor defense, and then after such an expenditure upon them as might not be deemed justifiable.

Second, five fourth-rate vessels of small tonnage, only one of which was designed as a war-vessel, and all of which are auxiliary merely.

Third, twenty-seven cruising-ships, three of which are built of iron, of small tonnage, and twenty-four of wood. Of these wooden vessels it is estimated by the Chief Constructor of the Navy that only three will be serviceable beyond a period of six years, at which time it may be said that of the present naval force nothing worthy the name will remain.

All the vessels heretofore authorized are under contract or in course of construction, except the armored ships, the torpedo and dynamite boats, and one cruiser. As to the last of these, the bids were in excess of the limit fixed by Congress. The production in the United States of armor and gun-steel is a question which it seems necessary to settle at an early day, if the armored war-vessels are to be completed with those materials of home manufacture. This has been the subject of investigation by two boards and by two special committees of Congress within the last three years. The report of the Gun Foundry Board in 1884, of the Board on Fortifications made in January last, and the reports of the select committees of the two houses made at the last session of Congress, have entirely exhausted the subject, so far as preliminary investigation is involved, and in their recommendations they are substantially agreed.

In the event that the present invitation of the department forbids to furnish such of this material as is now authorized shall fail to induce domestic manufacturers to undertake the large expenditures required to prepare for this new manufacture, and no other steps are taken by Congress at its coming session, the Secretary contemplates with dissatisfaction the necessity of obtaining abroad the armor and the gun-steel for the authorized ships. It would seem desirable that the wants of the army and the navy in this regard should be reasonably met, and that by uniting their contracts such inducement might be offered as would result in securing the domestication of these important interests.

The affairs of the postal service show marked and gratifying improvement during the past year. A particular account of its transactions and condition is given in the report of the Postmaster-General, which will be laid before you.

The reduction of the rate of letter-postage in 1883, rendering the postal revenues inadequate to sustain the expenditures, and business depression also contributing, resulted in an excess of cost for the fiscal year ended June 30, 1885, of eight and one third millions of dollars. An additional check upon receipts by doubling the measure of weight in rating sealed correspondence and diminishing one half of the charge for newspaper carriage, was imposed by legislation which took effect with the beginning of the past fiscal year; while the constant demand of our territorial development and growing population, for the extension and increase of mail facilities and machinery, necessitates steady annual advance in outlay; and the careful estimate of a year ago upon the rates of expenditure then existing contemplated the unavoidable augmentation of the deficiency in the last fiscal year by nearly two millions of dollars. The anticipated revenue for the last year failed of realization by about \$64,000; but proper measures of economy have so satisfactorily limited the growth of expenditure that the total deficiency, in fact, fell below that of 1885; and at this time the increase of revenue is in a gaining ratio over the increase of cost, demonstrating the sufficiency of the present rates of postage ultimately to

sustain the service. This is the more pleasing, because our people enjoy now both cheaper postage, proportionably to distances, and a vaster and more costly service than any other upon the globe.

Retrenchment has been effected in the cost of supplies, some expenditures unwarranted by law have ceased, and the outlays for mail-carriage have been subjected to beneficial scrutiny. At the close of the last fiscal year the expense of transportation on star routes stood at an annual rate of cost less by over \$560,000 than at the close of the previous year; and steamboat and mail-messenger service at nearly \$200,000 less.

The service has been in the mean time enlarged and extended by the establishment of new offices, increase of routes of carriage, expansion of carrier-delivery conveniences, and additions to the railway-mail facilities, in accordance with the growing exigencies of the country and the long-established policy of the Government.

The Postmaster-General calls attention to the existing law for compensating railroads, and expresses the opinion that a method may be devised which will prove more just to the carriers and beneficial to the Government; and the subject appears worthy of your early consideration.

The differences which arose during the year with certain of the ocean-steamship companies have terminated by the acquiescence of all in the policy of the Government approved by the Congress in the postal appropriation at its last session; and the department now enjoys the utmost service afforded by all vessels which sail from our ports upon either ocean—a service generally adequate to the needs of our intercourse. Petitions have, however, been presented to the department by numerous merchants and manufacturers for the establishment of a direct service to the Argentine Republic and for semi-monthly dispatches to the Empire of Brazil; and the subject is commended to your consideration. It is an obvious duty to provide the means of postal communication which our commerce requires, and with prudent forecast of results the wise extension of it may lead to stimulating intercourse and become the harbinger of a profitable traffic, which will open new avenues for the disposition of the products of our industry. The circumstances of the countries at the far south of our continent are such as to invite our enterprise and afford the promise of sufficient advantages to justify an unusual effort to bring about the closer relations which greater freedom of communication would tend to establish.

I suggest that, as distinguished from a grant or subsidy for the mere benefit of any line of trade or travel, whatever outlay may be required to secure additional postal service, necessary and proper and not otherwise attainable, should be regarded as within the limit of legitimate compensation for such service.

The extension of the free-delivery service as suggested by the Postmaster-General has heretofore received my sanction, and it is to be hoped a suitable enactment may soon be agreed upon.

The request for an appropriation sufficient to enable the general inspection of fourth-class offices has my approbation.

I renew my approval of the recommendation of the Postmaster-General that another assistant be provided for the Post-Office Department; and I invite your attention to the several other recommendations in his report.

The conduct of the Department of Justice for the last fiscal year is fully detailed in the report of the Attorney-General, and I invite the earnest attention of the Congress to the same, and due consideration of the recommendations therein contained.

In the report submitted by this officer to the last session of the Congress he strongly recommended the erection of a penitentiary for the confinement of prisoners convicted and sentenced in the United States courts; and he repeats the recommendation in his report for the last year.

This is a matter of very great importance and should at once receive congressional action. United States prisoners are now confined in more than thirty different State prisons and penitentiaries scattered every part of the country. They are subjected nearly as many different modes of treatment, discipline, and are far too much removed from control and regulation of the Government. So as they are entitled to humane treatment and an opportunity for improvement and reformation, the Government is responsible to them and society that things are forthcoming. But this duty can scarcely be discharged without more absolute control and reformation than is possible under the present system.

Many of our good citizens have interested themselves, with the most beneficial results, in the question of prison reform. The General Government should be in a situation, since there must be United States prisoners, to furnish important aid in movement, and should be able to illustrate what may be practically done in the direction of this reformation and to present an example in the treatment and improvement of its prisoners worthy of imitation.

With prisons under its own control, the Government could deal with the somewhat vexed question of convict-labor, so far as its convicts were concerned according to a plan of its own adoption, and with regard to the rights and interests of our laboring citizens, instead of sometimes aiding in the operation of a system which causes among them irritation and discontent.

Upon consideration of this subject it might be thought wise to erect more than one of these institutions located in such places as would best subserve the purposes of convenience and economy in transportation. The considerable cost of maintaining these convicts as at present, in State institutions, would be saved the adoption of the plan proposed; and by employing them in the manufacture of such articles as were needed for use by the Government, quite a large pecuniary benefit would be realized in partial return for our outlay.

I again urge a change in the Federal judicial system to meet the wants of the people and obviate the delays necessarily attending the present condition of affairs in our courts. All are agreed that something should be done, and much favor is shown, by the well able to advise, to the plan suggested by the Attorney-General at the last session of Congress as recommended in my last annual message. This recommendation is here renewed, together with another made at the same time, touching a change in the manner of compensating district attorneys and marshals and the latter subject is commended to the Congress for its action, in the interest of economy to the Government, and humanity, fairness, and justice to the people.

The report of the Secretary of the Interior presents a comprehensive summary of the work of the various branches of the public service connected with that department; and the suggestions and recommendations which it contains for the improvement of that service should receive your careful consideration.

The exhibit made of the condition of our Indian population, and the progress of the work for their enlightenment, notwithstanding the many embarrassments which hinder the better administration of this important branch of the service, is a gratifying and hopeful one.

The funds appropriated for the Indian service in the fiscal year just passed, with the available income from Indian land and trust moneys, amounting in all to \$7,850,775.12, were ample for the service and the conditions and restrictions of laws regulating the expenditure. There remained a balance on hand June 30, 1886, of \$1,660,023.30, of which \$1,887,765. are permanent funds for fulfillment of treaties, at other like purposes, and the remainder, \$322,255.09 subject to be carried to the surplus fund as required by law.

The estimates presented for appropriations for the ensuing fiscal year amount to \$5,603,878.64, or \$442,386.20 less than those laid before the Congress last year.

The present system of agencies, while absolutely necessary and well adapted for the management of our Indian affairs and for the ends in view, when it was adopted, is at the present stage of Indian management inadequate, standing alone, for the accomplishment of an object which has become pressing in its importance—the more rapid transition from tribal organizations to citizenship, of such portions of the Indians as are capable of civilized life.

When the existing system was adopted the Indian race was outside of the limits of organized States and Territories, and beyond the immediate reach and operation of civilization; and all efforts were mainly directed to the maintenance of friendly relations and the preservation of peace and quiet on the frontier. All this is now changed. There is no such thing as the Indian frontier. Civilization, with the busy hum of industry and the influences of Christianity, surrounds these people at every point. None of the tribes are outside of the bounds of organized government and society, except that the territorial system has not been extended over that portion of the country known as the Indian Territory. As a race the Indians are no longer hostile, but may be considered as submissive to the control of the Government; few of them only are troublesome. Except the fragments of several bands, all are now gathered upon reservations.

It is no longer possible for them to subsist by the chase and the spontaneous productions of the earth.

With an abundance of land, if furnished with the means and implements for profitable husbandry, their life of entire dependence upon Government rations from day to day is no longer defensible. Their inclination, long fostered by a defective system of control, is to cling to the habits and customs of their ancestors, and struggle with persistence against the change of life which their altered circumstances press upon them. But barbarism and civilization can not live together. It is impossible that such incongruous conditions should coexist on the same soil.

They are a portion of our people, are under the authority of our Government, and have a peculiar claim upon and are entitled to the fostering care and protection of the nation. The Government can not relieve itself of this responsibility until they are so far trained and civilized as to be able wholly to manage and care for themselves. The paths in which they should walk must be clearly marked out for them, and they must be led or guided until they are familiar with the way and competent to assume the duties and responsibilities of our citizenship.

Progress in this great work will continue only at the present slow pace and at great expense, unless the system and methods of management are improved to meet the changed conditions and urgent demands of the service.

The agents having general charge and supervision in many cases of more than five thousand Indians, scattered over large reservations, and burdened with the details of accountability for funds and supplies, have time to look after the industrial training and improvement of a few Indians only; the many are neglected and remain idle and dependent—conditions not favorable for progress in civilization.

The compensation allowed these agents, and the conditions of the service, are not calculated to secure for the work men who are fitted by ability and skill to properly plan and intelligently direct the methods best adapted to produce the most speedy results and permanent benefits.

Hence the necessity for a supplemental agency or system, directed to the end of promoting the general and more rapid transition of the tribes from habits and customs of barbarism to the ways of civilization.

With an anxious desire to devise some plan of op-

eration by which to secure the welfare of the Indians, and to relieve the Treasury as far as possible from the support of an idle and dependent population, I recommended in my previous annual message the passage of a law authorizing the appointment of a commission as an instrumentality auxiliary to those already established, for the care of the Indians. It was designed that this commission should be composed of six intelligent and capable persons—three to be detailed from the army—having practical ideas upon the subject of the treatment of Indians, and interested in their welfare; and that it should be charged, under the direction of the Secretary of the Interior, with the management of such matters of detail as can not with the present organization be properly and successfully conducted, and which present different phases, as the Indians themselves differ, in their progress, needs, disposition, and capacity for improvement or immediate self-support.

By the aid of such a commission much unwise and useless expenditure of money, waste of materials, and unavailing efforts might be avoided; and it is hoped that this or some measure which the wisdom of Congress may better devise, to supply the deficiency of the present system, may receive your consideration, and the appropriate legislation be provided.

The time is ripe for the work of such an agency.

There is less opposition to the education and training of the Indian youth, as shown by the increased attendance upon the schools, and there is a yielding tendency for the individual holding of lands. Development and advancement in these directions are essential, and should have every encouragement. As the rising generation are taught the language of civilization and trained in habits of industry, they should assume the duties, privileges, and responsibilities of citizenship.

No obstacle should hinder the location and settlement of any Indian willing to take land in severalty; on the contrary, the inclination to do so should be stimulated at all times when proper and expedient. But there is no authority of law for making allotments on some of the reservations, and on others the allotments provided for are so small, that the Indians, though ready and desiring to settle down, are not willing to accept such small areas, when their reservations contain ample lands to afford them homesteads of sufficient size to meet their present and future needs.

These inequalities of existing special laws and treaties should be corrected, and some general legislation on the subject should be provided, so that the more progressive members of the different tribes may be settled upon homesteads, and by their example lead others to follow, breaking away from tribal customs and substituting therefor the love of home, the interest of the family, and the rule of the state.

The Indian character and nature are such that they are not easily led while brooding over unadjusted wrongs. This is especially so regarding their lands. Matters arising from the construction and operation of railroads across some of the reservations, and claims of title and right of occupancy set up by white persons to some of the best land within other reservations, require legislation for their final adjustment.

The settlement of these matters will remove many embarrassments to progress in the work of leading the Indians to the adoption of our institutions and bringing them under the operation, the influence, and the protection of the universal laws of our country.

The recommendations of the Secretary of the Interior and the Commissioner of the General Land-Office looking to the better protection of public lands and of the public surveys, the preservation of national forests, the adjudication of grants to States and corporations and of private land claims, and the increased efficiency of the public land service, are commended to the attention of Congress. To secure the widest distribution of public lands in limited quantities among settlers for residence and cultivation and thus make the greatest number of individual homes, was

the primary object of the public land legislation in the early days of the republic. This system was a simple one. It commenced with an admirable scheme of public surveys, by which the humblest citizen could identify the tract upon which he wished to establish his home. The price of lands was placed within the reach of all the enterprising, industrious, and honest pioneer citizens of the country. It was soon, however, found that the object of the laws was perverted under the system of cash sales, from a distribution of land among the people to an accumulation of land capital by wealthy and speculative persons. To check this tendency a preference right of purchase was given to settlers on the land, a plan which culminated in the general pre-emption act of 1841. The foundation of this system was actual residence and cultivation. Twenty years later the homestead law was devised to more surely place actual homes in the possession of actual cultivators of the soil. The land was given without price, the sole conditions being residence, improvement, and cultivation. Other laws have followed, each designed to encourage the acquirement and use of land in limited individual quantities. But in later years these laws, through vicious administrative methods and under changed conditions of communication and transportation, have been so evaded and violated that their beneficent purpose is threatened with entire defeat. The methods of such evasions and violations are set forth in detail in the reports of the Secretary of the Interior and Commissioner of the General Land-Office. The rapid appropriation of our public lands without *bona-fide* settlements or cultivation, and not only without intention of residence, but for the purpose of their aggregation in large holdings, in many cases in the hands of foreigners, invites the serious and immediate attention of the Congress.

The energies of the land department have been devoted during the present administration to remedy defects and correct abuses in the public land service. The results of these efforts are so largely in the nature of reforms in the processes and methods of our land system as to prevent adequate estimate; but it appears by a compilation from the reports of the Commissioner of the General Land-Office that the immediate effect in leading cases which have come to a final termination has been the restoration to the mass of public lands of two million seven hundred and fifty thousand acres; that two million three hundred and seventy thousand acres are embraced in investigations now pending before the department or the courts, and that the action of Congress has been asked to effect the restoration of two million seven hundred and ninety thousand acres additional; besides which four million acres have been withheld from reservation, and the rights of entry thereon maintained.

I recommend the repeal of the pre-emption and timber-culture acts, and that the homestead laws be so amended as to better secure compliance with their requirements of residence, improvement, and cultivation for the period of five years from date of entry, without commutation or provision for speculative relinquishment. I also recommend the repeal of the desert-land laws unless it shall be the pleasure of the Congress to so amend these laws as to render them less liable to abuses. As the chief motive for an evasion of the laws, and the principal cause of their result in land accumulation instead of land distribution, is the facility with which transfers are made of the right intended to be secured to settlers, it may be deemed advisable to provide by legislation some guards and checks upon the alienation of homestead rights and lands covered thereby until patents issue.

Last year an executive proclamation was issued directing the removal of fences which inclosed the public domain. Many of these have been removed in obedience to such order; but much of the public land still remains within the lines of these unlawful fences. The ingenious methods resorted to in order to continue these trespasses, and the hardihood of the pre-

tenses by which in some cases such inclosures justified, are fully detailed in the report of the Secretary of the Interior.

The removal of the fences still remaining which close public lands will be enforced with all the authority and means with which the executive branch of the Government is or shall be invested by the Congress for that purpose.

The report of the Commissioner of Pensions contains a detailed and most satisfactory exhibit of the operations of the Pension Bureau during the last year. The amount of work done was the largest any year since the organization of the bureau; and has been done at less cost than during the previous year in every division.

On the 30th day of June, 1886, there were 81 pensioners on the rolls of the bureau.

Since 1861 there have been 1,018,785 applications for pensions filed, of which 78,884 were based on service in the War of 1812. There were 621,782 these applications allowed, including 60,178 to soldiers of 1812 and their widows.

The total amount paid for pensions since 1861 was \$808,624,811.67.

The number of new pensions allowed during the year ended June 30, 1886, is 40,857—a larger number than has been allowed in any year save one, 1861; the names of 2,229 pensioners which had previously dropped from the rolls, were restored during the year, and after deducting those dropped in the same time for various causes, a net increase remains for the year of 20,658 names.

From Jan. 1, 1861, to Dec. 1, 1885, 1,967 pension acts had been passed. Since the last-mentioned date, and during the last session of the Congress, 644 such acts became laws.

It seems to me that no one can examine our pension establishment and its operations, without being convinced that through its instrumentality justice is very nearly done to all who are entitled under existing laws to the pension bounty of the Government; but it is undeniable that cases exist, well entitled to relief, in which the Pension Bureau is powerless to aid the really worthy. Cases of this class are usually only lack by misfortune the kind or quality of which the law and regulations of the bureau require, or which, though their merit is apparent, for other reason can not be justly dealt with through general laws, and these conditions fully justify application to Congress and special enactments; but to resort to Congress for a special pension act to cover the deliberate and careful determination of the Pension Bureau on the merits is to secure favorable results when it could not be expected under most of the execution of the laws. It must be admitted that this opens the doors to the allowance of questionable claims, and presents to the legislative and executive branches of the Government applications once not within the law and plainly devoid of merit, so surrounded by sentiment and patriotic feeling that they are hard to resist. I suppose it will not be denied that many claims for pensions are made without merit and that many have been allowed upon fraudulent representations. This has been declared by the Pension Bureau, not only in this, but in previous administrations.

The usefulness and the justice of any system of the distribution of pensions depend upon the equality and uniformity of its operation.

It will be seen from the report of the Commissioner that there are now paid by the Government one hundred and thirty-one different rates of pension.

He estimates from the best information he can obtain that nine thousand of those who have served in the Army and Navy of the United States are supported, in whole or in part, from public funds by organized charities, exclusive of those in soldier's homes under the direction and control of the Government. Only 18 per cent. of these are pensioners while of the entire number of men furnished for

late war something like 90 per cent., including their widows and relatives, have been or now are in the receipt of pensions.

The American people, with a patriotic and grateful regard for our ex-soldiers—too broad and too sacred to be monopolized by any special advocates—are not only willing but anxious that equal and exact justice should be done to all honest claimants for pensions. In their sight the friendless and destitute soldier, dependent on public charity, if otherwise entitled, has precisely the same right to share in the provision made for those who fought their country's battles as those better able, through friends and influence, to push their claims. Every pension that is granted under our present plan upon any other grounds than actual service and injury or disease incurred in such service, and every instance of the many in which pensions are increased on other grounds than the merits of the claim, work an injustice to the brave and crippled, but poor and friendless soldier, who is entirely neglected, or who must be content with the smallest sum allowed under general laws.

There are far too many neighborhoods in which are found glaring cases of inequality of treatment in the matter of pensions; and they are largely due to a yielding in the Pension Bureau to importunity on the part of those, other than the pensioner, who are especially interested, or they arise from special acts passed for the benefit of individuals.

The men who fought side by side should stand side by side when they participate in a grateful nation's kind remembrance.

Every consideration of fairness and justice to our ex-soldiers and the protection of the patriotic instinct of our citizens from perversion and violation, point to the adoption of a pension system broad and comprehensive enough to cover every contingency, and which shall make unnecessary an objectionable volume of special legislation.

As long as we adhere to the principle of granting pensions for service, and disability as the result of the service, the allowance of pensions should be restricted to cases presenting these features.

Every patriotic heart responds to a tender consideration for those who, having served their country long and well, are reduced to destitution and dependence, not as an incident of their service, but with advancing age or through sickness or misfortune. We are all tempted by the contemplation of such a condition to supply relief, and are often impatient of the limitations of public duty. Yielding to no one in the desire to indulge this feeling of consideration, I can not rid myself of the conviction that if these ex-soldiers are to be relieved, they and their cause are entitled to the benefit of an enactment under which relief may be claimed as a right, and that such relief should be granted under the sanction of law, not in evasion of it; nor should such worthy objects of care, all equally entitled, be remitted to the unequal operation of sympathy, or the tender mercies of social and political influence with their unjust discriminations.

The discharged soldiers and sailors of the country are our fellow-citizens, and interested with us in the passage and faithful execution of wholesome laws. They can not be swerved from their duty of citizenship by artful appeals to their spirit of brotherhood born of common peril and suffering, nor will they exact as a test of devotion to their welfare a willingness to neglect public duty in their behalf.

On the 4th of March, 1885, the current business of the Patent-Office was, on an average, five and a half months in arrears, and, in several divisions more than twelve months behind. At the close of the last fiscal year such current work was but three months in arrears, and it is asserted and believed that in the next few months the delay in obtaining an examination of an application for a patent will be but nominal.

The number of applications for patents during the last fiscal year, including reissues, designs, trade-marks, and labels, equals 40,678, which is considera-

bly in excess of the number received during any preceding year.

The receipts of the Patent-Office during the year aggregate \$1,205,167.80, enabling the office to turn into the Treasury a surplus revenue, over and above all expenditures, of about \$163,710.80.

The number of patents granted during the last fiscal year, including reissues, trade-marks, designs, and labels, was 25,619—a number also quite largely in excess of that of any preceding year.

The report of the Commissioners shows the office to be in a prosperous condition, and constantly increasing in its business. No increase of force is asked for.

The amount estimated for the fiscal year ending June 30, 1886, was \$890,760. The amount estimated for the year ending June 30, 1887, was \$853,960. The amount estimated for the fiscal year ending June 30, 1888, is \$778,770.

The Secretary of the Interior suggests a change in the plan for the payment of the indebtedness of the Pacific subsidized roads to the Government. His suggestion has the unanimous indorsement of the persons selected by the Government to act as directors of these roads and protect the interests of the United States in the board of direction. In considering the plan proposed, the sole matters which should be taken into account, in my opinion, are the situation of the Government as a creditor, and the surest way to secure the payment of the principal and interest of its debt.

By a recent decision of the Supreme Court of the United States it has been adjudged that the laws of the several States are inoperative to regulate rates of transportation upon railroads, if such regulation interferes with the rate of carriage from one State into another. This important field of control and regulation having been thus left entirely unoccupied, the expediency of Federal action upon the subject is worthy of consideration.

The relations of labor to capital and of laboring men to their employers are of the utmost concern to every patriotic citizen. When these are strained and distorted, unjustifiable claims are apt to be insisted upon by both interests, and in the controversy which results, the welfare of all and the prosperity of the country are jeopardized. Any intervention of the General Government, within the limits of its constitutional authority, to avert such a condition, should be willingly accorded.

In a special message transmitted to the Congress at its last session I suggested the enlargement of our present Labor Bureau and adding to its present functions the power of arbitration in cases where differences arise between employer and employed. When these differences reach such a stage as to result in the interruption of commerce between the States, the application of this remedy by the General Government might be regarded as entirely within its constitutional powers. And I think we might reasonably hope that such arbitrators, if carefully selected and if entitled to the confidence of the parties to be affected, would be voluntarily called to the settlement of controversies of less extent and not necessarily within the domain of Federal regulation.

I am of the opinion that this suggestion is worthy the attention of the Congress.

But after all has been done by the passage of laws either Federal or State to relieve a situation full of solicitude, much more remains to be accomplished by the reinstatement and cultivation of a true American sentiment which recognizes the equality of American citizenship. This, in the light of our traditions and in loyalty to the spirit of our institutions, would teach that a hearty co-operation on the part of all interests is the surest path to national greatness and the happiness of all our people, that capital should, in recognition of the brotherhood of our citizenship and in a spirit of American fairness, generously accord to labor its just compensation and consideration, and that contented labor is capital's best protection and faithful ally. It would teach, too, that the diverse situations

of our people are inseparable from our civilization, that every citizen should, in his sphere, be a contributor to the general good, that capital does not necessarily tend to the oppression of labor, and that violent disturbances and disorders alienate from their promoters true American sympathy and kindly feeling.

The Department of Agriculture, representing the oldest and largest of our national industries, is subserving well the purposes of its organization. By the introduction of new subjects of farming enterprise, and by opening new sources of agricultural wealth and the dissemination of early information concerning production and prices, it has contributed largely to the country's prosperity. Through this agency, advanced thought and investigation touching the subjects it has in charge should, among other things, be practically applied to the home production at a low cost of articles of food which are now imported from abroad. Such an innovation will necessarily, of course, in the beginning, be within the domain of intelligent experiment; and the subject in every stage should receive all possible encouragement from the Government.

The interests of millions of our citizens engaged in agriculture are involved in an enlargement and improvement of the results of their labor; and a zealous regard for their welfare should be willing tribute to those whose productive returns are a main source of our progress and power.

The existence of pleuro-pneumonia among the cattle of various States has led to burdensome and in some cases disastrous restrictions in an important branch of our commerce, threatening to affect the quantity and quality of our food-supply. This is a matter of such importance and of such far-reaching consequence, that I hope it will engage the serious attention of the Congress, to the end that such a remedy may be applied as the limits of a constitutional delegation of power to the General Government will permit.

I commend to the consideration of the Congress the report of the Commissioner, and his suggestions concerning the interest intrusted to his care.

The continued operation of the law relating to our Civil Service has added the most convincing proofs of its necessity and usefulness. It is a fact worthy of note that every public officer who has a just idea of his duty to the people, testifies to the value of this reform. Its staunchest friends are found among those who understand it best, and its warmest supporters are those who are restrained and protected by its requirements.

The meaning of such restraint and protection is not appreciated by those who want places under the Government, regardless of merit and efficiency, nor by those who insist that the selection for such places should rest upon a proper credential showing active partisan work. They mean to public officers, if not their lives, the only opportunity afforded them to attend to public business, and they mean to the good people of the country the better performance of the work of their Government.

It is exceedingly strange that the scope and nature of this reform are so little understood, and that so many things not included within its plan are called by its name. When evil yields more fully to examination the system will have large additions to the number of its friends.

Our Civil-Service reform may be imperfect in some of its details; it may be misunderstood and opposed; it may not always be faithfully applied; its designs may sometimes miscarry through mistake or willful intent; it may sometimes tremble under the assaults of its enemies or languish under the misguided zeal of impracticable friends; but if the people of this country ever submit to the banishment of its underlying principle from the operation of their Government, they will abandon the surest guarantee of the safety and success of American institutions.

I invoke for this reform the cheerful and ungrudging support of the Congress. I renew my recommendation made last year that the salaries of the Commissioners

be made equal to other officers of the Government having like duties and responsibilities, and I hope such reasonable appropriations may be made to enable them to increase the usefulness of the they have in charge.

I desire to call the attention of the Congress to plain duty which the Government owes to the citizens in the Freedman's Savings and Trust Company.

This company was chartered by the Congress for the benefit of the most illiterate and humble people, and with the intention of encouraging industry and thrift. Most of its branches were aided over by officers holding the commission clothed in the uniform of the United States, and other circumstances reasonably, I think, led simple people to suppose that the invitation to deposit their hard-earned savings in this institution in an undertaking on the part of their Government their money should be safely kept for them.

When this company failed it was liable in the sum of \$2,939,925.23 to 61,181 depositors. Dividends amounting in the aggregate to 62 per cent. have been declared, and the sum called for and paid of such dividends seems to be \$1,648,181.72. This sum deducted from the entire amount of deposits leaves \$1,291,744.50 still unpaid. Past experience has shown quite a large part of this sum will not be called. There are assets still on hand amounting to the estimated sum of \$16,000.

I think the remaining 38 per cent. of such of deposits as have claimants should be paid by the Government, upon principles of equity and fairness.

The report of the Commissioner, soon to be laid before Congress, will give more satisfactory details on this subject.

The control of the affairs of the District of Columbia having been placed in the hands of purely executive officers, while the Congress still retains all legislative authority relating to its government, it becomes duty to make known the most pressing needs of the District and recommend their consideration.

The laws of the District appear to be in an uncertain and unsatisfactory condition, and their codification or revision is much needed.

During the past year one of the bridges leading from the District to the State of Virginia became unfit for use, and travel upon it was forbidden. It leads me to suggest that the improvement of all bridges crossing the Potomac and its branches, the city of Washington, is worthy of the attention of Congress.

The Commissioners of the District represent the laws regulating the sale of liquor and gambling licenses therefor should be at once amended, and legislation is needed to consolidate, define, and enlarge the scope and powers of charitable and educational institutions within the District.

I suggest that the Commissioners be clothed with the power to make, within fixed limitations, regulations. I believe this power, granted and fully guarded, would tend to subserve the good of the municipality.

It seems that trouble still exists growing out of occupation of the streets and avenues by certain roads having their termini in the city. It is very important that such laws should be enacted upon subject as will secure to the railroads all the facilities they require for the transaction of their business, at the same time protect citizens from injury to persons or property.

The Commissioners again complain that the accommodations afforded them for the necessary office of District business, and for the safe keeping of public books and papers, are entirely insufficient. I recommend that this condition of affairs be removed by the Congress, and that suitable quarters be provided for the needs of the District government.

In conclusion, I earnestly invoke such wise action on the part of the people's legislators, as will subserve the public good and demonstrate during the recess

ing days of the Congress as at present organized, its ability and inclination to so meet the people's needs that it shall be gratefully remembered by an expectant constituency.

GROVER CLEVELAND.

WASHINGTON, December 6, 1886.

Counting the Electoral Votes.—March 17, 1886, a bill to fix the day for the meeting of the electors of President and Vice-President, and to provide for and regulate the counting of the votes for President and Vice-President, and the decision of questions arising thereon, passed the Senate. December 7, the measure was reported with certain amendments to the House from a select committee to consider the subject. The following is the bill as reported, with the passages stricken out inclosed in brackets and those inserted printed in italics:

Be it enacted, etc., That the electors of each State shall meet and give their votes on the second Monday in January next following their appointment, at such place in each State as the Legislature of such State shall direct.

SEC. 2. That if any State shall have provided, by laws enacted prior to the day fixed for the appointment of the electors, for its final determination of any controversy or contest concerning the appointment of all or any of the electors of such State, by judicial or other methods or procedures, and such determination shall have been made at least six days before the time fixed for the meeting of the electors, such determination made pursuant to such law so existing on said day, and made at least six days prior to the said time of meeting of the electors, shall be conclusive, and shall govern in the counting of the electoral votes as provided in the Constitution, and as hereinafter regulated, so far as the ascertainment of the electors appointed by such State is concerned.

SEC. 3. That it shall be the duty of the Executive of each State, as soon as practicable after the conclusion of the appointment of electors in such State, by the final ascertainment under and in pursuance of the laws of such State providing for such ascertainment, to communicate, under the seal of the State, to the Secretary of State of the United States, a certificate of such ascertainment of the electors appointed, setting forth the names of such electors and the canvass or other ascertainment under the laws of such State of the number of votes given or cast for each person for whose appointment any and all votes have been given or cast; and it shall also thereupon be the duty of the Executive of each State to deliver to the electors of such State, on or before the day on which they are required by the preceding section to meet, the same certificate, in triplicate, under the seal of the State; and such certificate shall be inclosed and transmitted by the electors at the same time and in the same manner as is provided by law for transmitting by such electors to the seat of Government the lists of all persons voted for as President and of all persons voted for as Vice-President; and section 184 of the Revised Statutes is hereby repealed; and if there shall have been any final determination in a State of a controversy or contest as provided for in section 2 of this act, it shall be the duty of the Executive of such State, as soon as practicable after such determination, to communicate, under the seal of the State, to the Secretary of State of the United States, a certificate of such determination, in form and manner as the same shall have been made; and the Secretary of State of the United States, as soon as practicable after the receipt at the State Department of each of the certificates hereinbefore directed to be transmitted to the Secretary of State, shall publish, in such public newspaper as he shall designate, such certificates in full; and at the first meeting of Congress thereafter he shall transmit to the two Houses of Congress copies in full

of each and every such certificate so received theretofore at the State Department.

SEC. 4. That Congress shall be in session on the second Wednesday in February succeeding every meeting of the electors. The Senate and House of Representatives shall meet in the hall of the House of Representatives at the hour of one o'clock in the afternoon on that day, and the President of the Senate shall be their presiding officer. Two tellers shall be previously appointed on the part of the Senate and two on the part of the House of Representatives, to whom shall be handed, as they are opened by the President of the Senate, all the certificates and papers purporting to be certificates of the electoral votes, which certificates and papers shall be opened, presented, and acted upon in the alphabetical order of the States, beginning with the letter A; and said tellers, having then read the same in the presence and hearing of the two Houses, shall make a list of the votes as they shall appear from the said certificates; and the votes having been ascertained and counted in the manner and according to the rules in this act provided, the result of the same shall be delivered to the President of the Senate, who shall thereupon announce the state of the vote, and the names of the persons, if any, elected, which announcement shall be deemed a sufficient declaration of the persons, if any, elected President and Vice-President of the United States, and, together with a list of the votes, be entered on the journals of the two Houses. Upon such reading of any such certificate or paper, the President of the Senate shall call for objections, if any. Every objection shall be made in writing, and shall state clearly and concisely, and without argument, the ground thereof, and shall be signed by at least one Senator and one member of the House of Representatives before the same shall be received. When all objections so made to any vote or paper from a State shall have been received and read, the Senate shall thereupon withdraw, and such objections shall be submitted to the Senate for its decision; and the Speaker of the House of Representatives shall, in like manner, submit such objections to the House of Representatives for its decision; and no electoral vote or votes from any State from which but one *lawful* return has been received shall be rejected [except by the affirmative vote of both Houses]. If more than one return or paper purporting to be a return from a State shall have been received by the President of the Senate, those votes, and those only, shall be counted which shall have been regularly given by the electors who are shown by the determination mentioned in section 2 of this act to have been appointed, if the determination in said section provided for shall have been made, or by such successors or substitutes, in case of a vacancy in the board of electors so ascertained, as have been appointed to fill such vacancy in the mode provided by the laws of the State; but in case there shall arise the question which of two or more of such State authorities determining what electors have been appointed, as mentioned in section 2 of this act, is the lawful tribunal of such State, the votes regularly given of those electors, and those only, of such State shall be counted whose title as electors the two Houses, acting separately, shall concurrently decide is supported by the decision of such State so authorized by its laws; and in such case of more than one return or paper purporting to be a return from a State, if there shall have been no such determination of the question in the State aforesaid, then those votes, and those only, shall be counted which [the two Houses, acting separately, shall concurrently decide to be the lawful votes of the legally appointed electors of such State] *were cast by electors whose appointment shall have been duly certified under the seal of the State by the Executive thereof, in accordance with the laws of the State, unless the two Houses, acting separately, shall concurrently decide such votes not to be the lawful votes of the legally appointed electors of such State.* When

the two Houses have voted, they shall immediately again meet, and the presiding officer shall then announce the decision of the question submitted. No votes or papers from any other State shall be acted upon until the objections previously made to the votes or papers from any State shall have been finally disposed of.

Sec. 5. That while the two Houses shall be in meeting as provided in this act the President of the Senate shall have power to preserve order; and no debate shall be allowed and no question shall be put by the presiding officer except to either House on a motion to withdraw.

Sec. 6. That when the two Houses separate to decide upon an objection that may have been made to the counting of any electoral vote or votes from any State, or other question arising in the matter, each Senator and Representative may speak to such objection or question five minutes, and not more than once; but after such debate shall have lasted two hours it shall be the duty of the presiding officer of each House to put the main question without further debate.

Sec. 7. That at such joint meeting of the two Houses, seats shall be provided as follows: For the President of the Senate, the Speaker's chair; for the Speaker, immediately upon his left; the Senators, in the body of the hall upon the right of the presiding officer; for the Representatives, in the body of the hall not provided for the Senators; for the tellers, Secretary of the Senate, and Clerk of the House of Representatives, at the Clerk's desk; for the other officers of the two Houses, in front of the Clerk's desk and upon each side of the Speaker's platform. Such joint meeting shall not be dissolved until the count of electoral votes shall be completed and the result declared; and no recess shall be taken unless a question shall have arisen in regard to counting any such votes, or otherwise under this act, in which case it shall be competent for either House, acting separately, in the manner hereinbefore provided, to direct a recess of such House not beyond the next calendar day, Sunday excepted, at the hour of ten o'clock in the forenoon. But if the counting of the electoral votes and the declaration of the result shall not have been completed before the fifth calendar day next after such first meeting of the two Houses, no further or other recess shall be taken by either House.

In explanation of the measure, Mr. Eden, of Illinois, said:

"The object of the bill of the Senate is to fix certain rules by which the two Houses shall be governed in counting the electoral vote.

"In case of but one return from a State, the Senate bill allows the vote to be rejected by the affirmative vote of both Houses.

"When there is more than one return from a State, and a tribunal of the State, according to section 2 of the bill, has determined who are the lawfully appointed electors of the State, the votes of such electors are to be counted without question.

"If a question arises as to which of two or more of such State authorities, acting under section 2 of the bill, is the lawful tribunal of the State, then the vote of such electors only shall be counted as the two Houses, acting separately, shall concurrently decide is supported by the decision of such State so acting under its laws.

"In case of more than one return from a State, if no determination has been made by a tribunal thereof as to which is the lawful return, then those votes only shall be counted

which the two Houses, acting separately, shall concurrently decide to be the lawful votes of the legally appointed electors of the State.

"It will thus be seen that under the Senate bill there are three contingencies in which the two Houses in counting the electoral vote may refuse to count the vote of the State.

"The House committee has undertaken to remedy this defect by a limitation of the power of the two Houses to reject the vote of a State. We propose to amend the bill so that where there is but one return, or paper purporting to be a return, from a State, and the vote was regularly given, and the credentials of the electors are in due form and in accordance with the laws of the State, and properly certified by the executive authority thereof, the vote shall be counted.

"We propose a further amendment, that where there are two or more returns from a State, and no tribunal thereof has determined who are the legally appointed electors from the State, the votes regularly given by electors, whose appointment shall have been duly certified under the seal of the State by the Executive thereof, in accordance with the laws of the State, shall be counted, unless the two Houses, acting separately, shall concurrently decide such votes not to be the lawful votes of the legally appointed electors of such State. If the amendments proposed by the House committee be agreed to, there will be but one contingency in which the vote of a State may be rejected. That contingency is the presentation of double returns from a State by opposing State authorities, disagreeing in the determination as to which set of electors are the legally appointed electors of the State. In that case no electoral vote of the State will be counted unless the two Houses, acting separately, shall concurrently decide that one of the opposing sets of electors are the duly appointed electors of the State.

"In case of more than one return from a State, where no State tribunal has determined the question as to which is the true and lawful return, the vote of those electors regularly given who bear the official certificate of the Governor under the seal of the State, showing that they were duly appointed in pursuance of the laws of the State, under our amendment are to be counted unless rejected by the concurrent vote of both Houses, acting separately. I am of opinion that with the adoption of the proposed amendments the Senate bill may be safely passed, and that no question will remain to be determined relative to the count of the electoral vote, when the two Houses meet for that purpose, that can not be rightfully determined in accordance with the terms of this bill. Under the bill as thus amended the States are left not only to appoint the electors, but to determine all disputes relative to their appointment.

"If no dispute arises relative to the appointment, and no contesting electors appear to de-

mand a hearing, the bill as amended, should it become a law, absolutely requires the electoral vote of the State to be counted. If a dispute or contest has arisen relative to the appointment of electors, and the proper State authorities have determined who are the lawfully appointed electors, the bill as amended says the vote shall be counted. If more than one return of electoral votes is made from a State, and no determination has been made under its laws who, of the opposing forces, were lawfully appointed electors of the State, the bill as amended requires that the vote of those electors regularly given, who hold the certificate of the Governor under the seal of the State, showing that they were appointed according to the laws of the State, shall be counted, unless rejected by the concurrent vote of the two Houses, acting separately.

"In the one instance only, where a question arises as to which of two or more State authorities, acting under the second section of the bill, and having made conflicting decisions as to lawfully appointed electors from the State, is the concurrent action of both Houses required to decide as to the legally appointed electors from a State. In case no decision can be reached, of course the vote of the State will be lost; but that is an extreme case, and one not likely to arise except in revolutionary times."

Mr. Adams, of Illinois, in criticism of the measure, said:

"Whenever the two Houses of Congress agree that a certain alleged return is the legal vote of a State, their determination that that alleged return is the legal return is the counting of the vote of that State within the meaning of the Constitution; and whenever the two Houses of Congress agree that a certain alleged return does not represent the legal vote of the State, their concurrent determination that that alleged return is not the legal vote of the State is equivalent to a refusal to count the vote of that State within the meaning of the Constitution; hence, my judgment is that the entire scope of our power to legislate on this matter must be confined to the third contingency, namely, the case in which the two Houses of Congress neither concurrently vote 'yea' upon the proposition nor concurrently vote 'nay' upon it, but differ in opinion, and one decides one way and the other the other. The power of Congress to intervene in such a case arises, in my judgment, out of the necessity of the case, and the exercise of our legislative power to meet the contingency must be considered now to be in accordance with the meaning of the Constitution.

"There are several causes, Mr. Speaker, why it may be determined that an alleged vote of a State is not the real vote of the State.

"In the first place the persons claiming to be electors may not have been voted for by the people of their State according to the provisions of the Constitution and the laws enacted by the State.

"In the second place the persons assuming to have been elected as electors may have been ineligible to that office.

"In the third place, admitting that they were eligible and were duly elected, yet when they met to cast the electoral votes it may be that they did not cast them in accordance with the Constitution and the laws; and, fourthly, if in all their acts they complied with the Constitution and the law, and they are eligible to act as electors, and have been duly voted for as such, at the polls, yet the persons for whom they vote may not have been eligible to the office to which they assumed to elect them; and, in my judgment, notwithstanding the changes that have come over the character of Presidential elections in this country, these objections to the validity of an alleged electoral vote stand in full force to-day, and will so stand until the Constitution has been amended.

"I am aware that some of these cases of invalidity are not so important in our minds as they were in the minds of the framers of the Constitution. To us it may make little difference whether a person chosen as an elector is a Senator or Representative or person holding an office of profit and trust under the Government. To us it may appear to make little difference whether the electors vote by ballot as the law requires or not; or whether they cast their votes upon the day appointed by law or not.

"To us accustomed to the choice of a Presidential candidate by the convention of a political party, it may appear of less importance than it appeared to our fathers that the President elected should be a native-born citizen, or over thirty-five years of age. Yet all these provisions are still the provisions of the Constitution, and in my judgment it is not our duty to disregard them; it is our duty to observe them until in the wisdom of Congress and of the people it shall have been determined that the Constitution shall be changed.

"The reason why I refer to these different causes of invalidity is that, if the amendment proposed by the House committee is adopted, the only means which we have or can have for enforcing these provisions of the Constitution will have been done away forever. I know that when the two Houses of Congress meet here to count the electoral vote, the main question present to their minds and present to the minds of the people is the question which Presidential candidate the people appear to have preferred. And yet, so long as these provisions regarding the eligibility of electors, regarding the eligibility of a Presidential candidate, regarding the form and manner in which the electoral vote shall be cast, remain as portions of the Constitution, it is not only our bounden duty to observe and abide by them, but it is also the bounden duty of those two Houses of Congress, who have a duty imposed on them which is not imposed on us in passing upon this bill, the duty, namely, of sitting here in joint convention and deciding upon the elect-

oral vote submitted to them by the President of the Senate.

"But, Mr. Speaker, the main objection I have to the amendment proposed by the House committee, namely, the proposed striking out of the words 'except by the affirmative vote of the two Houses,' the effect of which would be that a single return would have a conclusive presumption of validity in its favor—the main objection which I have to that provision is that I believe it possesses no legal and constitutional validity whatever. However wise it may seem to us, in attempting to legislate on this subject, that a single return shall be conclusively presumed to be valid, the real question will arise when the two Houses meet here to pass upon the electoral votes in the next Presidential election; and those Houses, in my judgment, when they meet here to discharge a duty which is expressly imposed upon them by the Constitution, will not be bound by the action of the Senate and House of the Forty-ninth Congress and the President, when he signs this bill, if it shall pass. It is their duty, conferred on them by the Constitution, to count the votes. If for any reason whatever a single return shall appear to both Houses of Congress to be an invalid return they have the right so to determine; and if they do so determine, that vote will not be counted, however many statutes we may pass like this."

Mr. Oates, of Alabama, moved to "amend section 4 by striking out of lines 20 and 21 the following words: 'and the names of the persons, if any, elected'; so that the provision, if amended, will read: 'who [the President of the Senate] shall thereupon announce the state of the vote; which announcement shall be deemed a sufficient declaration of the persons, if any, elected President and Vice-President of the United States.'" The amendment was adopted by a vote of 141 to 109. Mr. Eden, of Illinois, moved the following amendment, which was also adopted:

After the word "State," in line 87, of section 4, insert "which shall have been regularly given by electors whose appointment has been certified to according to section 8 of this act"; so that the clause will read as follows:

"And the Speaker of the House of Representatives shall, in like manner, submit such objections to the House of Representatives for its decision; and no electoral vote or votes from any State which shall have been regularly given by electors whose appointment has been certified to according to section 8 of this act, from which but one return has been received, shall be rejected."

The bill was then passed, December 9, without a division. The Senate non-concurred in the House amendments, and a conference committee was appointed which reported Jan. 14, 1887, as follows:

That the Senate agree to the amendments of the House numbered 1 and 2.

That the Senate agree to the amendment of the House numbered 8 with an amendment, to wit: On page 8, line 80, insert in the sentence proposed by the

House to be inserted in the bill, after the "been," and before the word "certified," the "lawfully"; and that the House agree to the same.

That the Senate agree to the amendment of House numbered 4, with an amendment, to wit: In lieu of the words stricken out by the House insert the following: "but the two Houses concurrently reject the vote or votes when they agree that vote or votes have not been so regularly given by electors whose appointment has been so certified and that the House agree to the same."

That the Senate agree to the amendment of House numbered 5, with an amendment, to wit: In lieu of the words proposed to be stricken out insert as follows: "the two Houses concurrently decide were cast by lawful electors pointed in accordance with the laws of the State less the two Houses, acting separately, shall concurrently decide such votes not to be the lawful votes of the legally appointed electors of such State, if the two Houses shall disagree in respect to counting of such votes, then, and in that case votes of the electors whose appointment shall have been certified by the Executive of the State, under seal thereof, shall be counted"; and that the House agree to the same.

Both Houses adopted the conference report and the measure was approved by the President Feb. 8, 1887.

Polygamy.—Jan. 8, 1886, a bill passed the Senate to amend an act entitled "An act to amend section 5352 of the Revised Statutes of the United States in reference to bigamy, for other purposes," approved March 22, 1878. The Judiciary Committee of the House reported this measure Jan. 12, 1887, with a substitute. The substitute proposed by the committee was slightly amended on motion of Mr. Tucker of Virginia, and then passed without a division. On January 13, the Senate non-concurred in the House amendments, and a conference committee was appointed. February 15, the conference committee reported recommending the passage of the following measure:

SECTION 1. That in any proceeding or examination before a grand jury, a judge, justice, or a United States commissioner, or a court, in any prosecution for bigamy, polygamy, or unlawful cohabitation, under any statute of the United States, the lawful husband or wife of the person accused shall be a competent witness, and may be called, but shall not be compelled to testify in such proceeding, examination, or prosecution without the consent of the husband or wife, as the case may be; and such witness shall not be permitted to testify as to any statement or communication made by either husband or wife to each other, during the existence of the marriage relation, deemed confidential under common law.

SEC. 2. That in any prosecution for bigamy, polygamy, or unlawful cohabitation, under any statute of the United States, whether before a United States commissioner, justice, judge, a grand jury, or a court, an attachment for any witness may be issued by the court, judge, or commissioner, without a previous subpoena, compelling the immediate attendance of such witness, when it shall appear by oath or affirmation, to the commissioner, justice, judge, or court, as the case may be, that there is reasonable ground to believe that such witness will unlawfully fail to obey a subpoena issued and served in the usual course in such cases; and in such case the usual witness fee shall be paid to such witness so attached. *Provided,* That the person so attached may at any time secure his or her discharge from custody by executing a recognizance, with sufficient surety, con-

tioned for the appearance of such person at the proper time, as a witness in the cause or proceeding wherein the attachment may be issued.

Sec. 3. That whoever commits adultery shall be punished by imprisonment in the penitentiary not exceeding three years; and when the act is committed between a married woman and a man who is unmarried, both parties to such act shall be deemed guilty of adultery; and when such act is committed between a married man and a woman who is unmarried, the man shall be deemed guilty of adultery.

Sec. 4. That if any person related to another person within and not including the fourth degree of consanguinity computed according to the rules of the civil law, shall marry or cohabit with, or have sexual intercourse with such other so related person, knowing her or him to be within said degree of relationship, the person so offending shall be deemed guilty of incest, and, on conviction thereof, shall be punished by imprisonment in the penitentiary not less than three years and not more than fifteen years.

Sec. 5. That if an unmarried man or woman commit fornication, each of them shall be punished by imprisonment not exceeding six months, or by fine not exceeding \$100.

Sec. 6. That all laws of the Legislative Assembly of the Territory of Utah which provide that prosecutions for adultery can only be commenced on the complaint of the husband or wife are hereby disapproved and annulled; and all prosecutions for adultery may hereafter be instituted in the same way that prosecutions for other crimes are.

Sec. 7. That commissioners appointed by the Supreme Court and district courts in the Territory of Utah shall possess and may exercise all the powers and jurisdiction that are or may be possessed or exercised by justices of the peace in said Territory under the laws thereof, and the same powers conferred by law on commissioners appointed by circuit courts of the United States.

Sec. 8. That the Marshal of said Territory of Utah, and his deputies, shall possess and may exercise all the powers in executing the laws of the United States or of said Territory possessed and exercised by sheriffs, constables, and their deputies as peace officers; and each of them shall cause all offenders against the law, in his view, to enter into recognizance to keep the peace and to appear at the next term of the court having jurisdiction of the case, and to commit to jail in case of failure to give such recognizance. They shall quell and suppress assaults and batteries, riots, routs, affrays, and insurrections.

Sec. 9. That every ceremony of marriage, or in the nature of a marriage ceremony, of any kind, in any of the Territories of the United States, whether either or both or more of the parties to such ceremony be lawfully competent to be the subjects of such marriage or ceremony or not, shall be certified by a certificate stating the fact and nature of such ceremony, the full names of each of the parties concerned, and the full names of every officer, priest, and person, by whatever style or designation called or known, in any way taking part in the performance of such ceremony, which certificate shall be drawn up and signed by the parties to such ceremony and by every officer, priest, and person taking part in the performance of such ceremony, and shall be by the officer, priest, or other person solemnizing such marriage or ceremony filed in the office of the probate court, or, if there be none, in the office of the court having probate powers in the county or district in which such ceremony shall take place, for record, and shall be immediately recorded, and be at all times subject to inspection as other public records. Such certificate, or the record thereof, or a duly certified copy of such record, shall be *prima facie* evidence of the facts required by this act to be stated therein, in any proceeding, civil or criminal, in which the matter shall be drawn in question. Any person who shall willfully violate any of the provisions of this section shall be deemed guilty of a misde-

meanor, and shall, on conviction thereof, be punished by a fine of not more than \$1,000, or by imprisonment not longer than two years, or by both said punishments, in the discretion of the court.

Sec. 10. That nothing in this act shall be held to prevent the proof of marriages, whether lawful or unlawful, by any evidence now legally admissible for that purpose.

Sec. 11. That the laws enacted by the Legislative Assembly of the Territory of Utah which provide for or recognize the capacity of illegitimate children to inherit or to be entitled to any distributive share in the estate of the father of any such illegitimate child are hereby disapproved and annulled; and no illegitimate child shall hereafter be entitled to inherit from his or her father or to receive any distributive share in the estate of his or her father: *Provided*, That this section shall not apply to any illegitimate child born within twelve months after the passage of this act, nor to any child made legitimate by the seventh section of the act entitled "An act to amend section 5852 of the Revised Statutes of the United States, in reference to bigamy, and for other purposes," approved March 22, 1882.

Sec. 12. That the laws enacted by the Legislative Assembly of the Territory of Utah conferring jurisdiction upon probate courts, or the judges thereof, or any of them, in said Territory, other than in respect of the estates of deceased persons, and in respect of the guardianship of the persons and property of infants, and in respect of the persons and property of persons not of sound mind, are hereby disapproved and annulled; and no probate court or judge of probate shall exercise any jurisdiction other than in respect of the matters aforesaid, except as a member of a county court; and every such jurisdiction so by force of this act withdrawn from the said probate courts or judges shall be had and exercised by the district courts of said Territory, respectively.

Sec. 13. That it shall be the duty of the Attorney-General of the United States to institute and prosecute proceedings to forfeit and escheat to the United States the property of corporations obtained or held in violation of section 8 of the act of Congress approved the 1st day of July, 1882, entitled "An act to punish and prevent the practice of polygamy in the Territories of the United States and other places, and disapproving and annulling certain acts of the Legislative Assembly of the Territory of Utah," or in violation of section 1890 of the Revised Statutes of the United States; and all such property so forfeited and escheated to the United States shall be disposed of by the Secretary of the Interior, and the proceeds thereof applied to the use and benefit of the common schools in the Territory in which such property may be: *Provided*, That no building, or the grounds appurtenant thereto, which is held and occupied exclusively for purposes of the worship of God, or personage connected therewith, or burial-ground, shall be forfeited.

Sec. 14. That in any proceeding for the enforcement of the provisions of law against corporations or associations acquiring or holding property in any Territory of the United States in excess of the amount limited by law, the court before which such proceeding may be instituted shall have power in a summary way to compel the production of all books, records, papers, and documents of or belonging to any trustee or person holding or controlling or managing property in which such corporation may have any right, title, or interest whatever.

Sec. 15. That all laws of the Legislative Assembly of the Territory of Utah, or of the so-called government of the State of Deseret, creating, organizing, amending, or continuing the corporation or association called the Perpetual Emigrating Fund Company are hereby disapproved and annulled; and the said corporation, in so far as it may now have, or pretend to have, any legal existence, is hereby dissolved; and it shall not be lawful for the Legislative Assembly of the Territory of Utah to create, organize, or in any man-

ner recognize any such corporation or association, or to pass any law for the purpose of or operating to accomplish the bringing of persons into the said Territory for any purpose whatsoever.

Sec. 16. That it shall be the duty of the Attorney-General of the United States to cause such proceedings to be taken in the Supreme Court of the Territory of Utah as shall be proper to carry into effect the provisions of the preceding section, and pay the debts and to dispose of the property and assets of said corporation according to law. Said property and assets, in excess of the debts and the amount of any lawful claims established by the court against the same, shall escheat to the United States, and shall be taken, invested, and disposed of by the Secretary of the Interior, under the direction of the President of the United States, for the benefit of common schools in said Territory.

Sec. 17. That the acts of the Legislative Assembly of the Territory of Utah, incorporating, continuing, or providing for the corporation known as the Church of Jesus Christ of Latter-Day Saints, and the ordinance of the so-called General Assembly of the State of Deseret incorporating the Church of Jesus Christ of Latter-Day Saints, so far as the same may now have legal force and validity, are hereby disapproved and annulled, and the said corporation, in so far as it may now have, or pretend to have, any legal existence, is hereby dissolved. That it shall be the duty of the Attorney-General of the United States to cause such proceedings to be taken in the Supreme Court of the Territory of Utah as shall be proper to execute the foregoing provisions of this section and to wind up the affairs of said corporation conformably to law; and in such proceedings the court shall have power, and it shall be its duty, to make such decree or decrees as shall be proper to effectuate the transfer of the title to real property now held and used by said corporation for places of worship, and parsonages connected therewith, and burial-grounds, and of the description mentioned in the proviso to section 13 of this act and in section 26 of this act, to the respective trustees mentioned in section 26 of this act; and for the purposes of this section said court shall have all the powers of a court of equity.

Sec. 18. (a) A widow shall be endowed of the third part of all the lands whereof her husband was seized of an estate of inheritance at any time during the marriage, unless she shall have lawfully released her right thereto.

(b) The widow of any alien who at the time of his death shall be entitled by law to hold any real estate, if she be an inhabitant of the Territory at the time of such death, shall be entitled to dower of such estate in the same manner as if such alien had been a native citizen.

(c) If a husband seized of an estate of inheritance in lands exchanges them for other lands, his widow shall not have dower of both, but shall make her election to be endowed of the lands given or of those taken in exchange; and if such election be not evinced by the commencement of proceedings to recover her dower of the lands given in exchange within one year after the death of her husband, she shall be deemed to have elected to take her dower of the lands received in exchange.

(d) When a person seized of an estate of inheritance in lands shall have executed a mortgage, or other conveyance in the nature of mortgage, of such estate, before marriage, his widow shall nevertheless be entitled to dower out of the lands mortgaged or so conveyed, as against every person except the mortgagee or grantee in such conveyance and those claiming under him.

(e) Where a husband shall purchase lands during coverture, and shall at the same time execute a mortgage, or other conveyance in the nature of mortgage, of his estate in such lands to secure the payment of the purchase-money, his widow shall not be entitled to dower out of such lands, as against the mortgagee or grantee in such conveyance or those claiming under him, although she shall not have united in

such mortgage; but she shall be entitled to her dower in such lands as against all other persons.

(f) Where in such case the mortgagee, or such grantee or those claiming under him, shall, after the death of the husband of such widow, cause the land mortgaged or so conveyed to be sold, either under a power of sale contained in the mortgage or such conveyance, or by virtue of the decree of a court, if any surplus shall remain after payment of the moneys due on such mortgage or such conveyance, and the costs and charges of the sale, such widow shall nevertheless be entitled to the interest or income of the one-third part of such surplus for her life as her dower.

(g) A widow shall not be endowed of lands conveyed to her husband by way of mortgage unless he acquire an absolute estate therein during the marriage period.

(h) In case of divorces dissolving the marriage contract for the misconduct of the wife, she shall not be endowed.

Sec. 19. That hereafter the judge of probate in each county within the Territory of Utah provided for by the existing laws thereof shall be appointed by the President of the United States, by and with the advice and consent of the Senate; and so much of the laws of said Territory as provide for the election of such judge by the Legislative Assembly are hereby disapproved and annulled.

Sec. 20. That it shall not be lawful for any female to vote at any election hereafter held in the Territory of Utah for any public purpose whatever, and no such vote shall be received or counted or given effect in any manner whatever; and any and every act of the Legislative Assembly of the Territory of Utah providing for or allowing the registration or voting by females is hereby annulled.

Sec. 21. That all laws of the Legislative Assembly of the Territory of Utah which provide for numbering or identifying the votes of the electors at any election in said Territory are hereby disapproved and annulled; but the foregoing provision shall not preclude the lawful registration of voters, or any other provisions for securing fair elections which do not involve the disclosure of the candidates for whom any particular elector shall have voted.

Sec. 22. That the existing election districts and apportionments of representation concerning the members of the Legislative Assembly of the Territory of Utah are hereby abolished; and it shall be the duty of the Governor, Territorial Secretary, and the Board of Commissioners mentioned in section 9 of the act of Congress approved March 22, 1882, entitled "An act to amend section 5852 of the Revised Statutes of the United States, in reference to bigamy, and for other purposes," in said Territory, forthwith to redistrict said Territory, and apportion representation in the same in such manner as to provide, as nearly as may be, for an equal representation of the people (excepting Indians not taxed), being citizens of the United States, according to numbers, in said Legislative Assembly, and to the number of members of the Council and House of Representatives, respectively, as now established by law; and a record of the establishment of such new districts and the apportionment of representation thereto shall be made in the office of the Secretary of said Territory, and such establishment and representation shall continue until Congress shall otherwise provide; and no persons other than citizens of the United States otherwise qualified shall be entitled to vote at any election in said Territory.

Sec. 23. That the provisions of section 9 of said act approved, March 22, 1882, in regard to registration and election of officers, and the registration of voters, and the conduct of elections, and the powers and duties of the board therein mentioned, shall continue and remain operative until the provisions and laws therein referred to, to be made and enacted by the Legislative Assembly of said Territory of Utah, shall have been made and enacted by said Assembly and shall have been approved by Congress.

Sec. 24. That every male person twenty-one years of age resident in the Territory of Utah shall, as a condition-precedent to his right to register or vote at any election in said Territory, take and subscribe an oath or affirmation, before the registration officer of his voting precinct, that he is over twenty-one years of age, and has resided in the Territory of Utah for six months then last passed and in the precinct for one month immediately preceding the date thereof, and that he is a native-born (or naturalized, as the case may be) citizen of the United States, and further state in such oath or affirmation his full name, with his age, place of business, his status, whether single or married, and, if married, the name of his lawful wife, and that he will support the Constitution of the United States and will faithfully obey the laws thereof, and especially will obey the act of Congress approved March 22, 1882, entitled "An act to amend section 5352 of the Revised Statutes of the United States, in reference to bigamy, and for other purposes," and will also obey this act in respect of the crimes in said act defined and forbidden, and that he will not, directly or indirectly, aid or abet, counsel or advise, any other person to commit any of said crimes. Such registration officer is authorized to administer said oath or affirmation; and all such oaths or affirmations shall be by him delivered to the clerk of the probate court of the proper county, and shall be deemed public records therein. But if any election shall occur in said Territory before the next revision of the registration lists as required by law, the said oath or affirmation shall be administered by the presiding judge of the election precinct on or before the day of election. As a condition-precedent to the right to hold office in or under said Territory, the officer, before entering on the duties of his office, shall take and subscribe an oath or affirmation declaring his full name, with his age, place of business, his status, whether married or single, and, if married, the name of his lawful wife, and that he will support the Constitution of the United States and will faithfully obey the laws thereof, and especially will obey the act of Congress approved March 22, 1882, entitled "An act to amend section 5352 of the Revised Statutes of the United States, in reference to bigamy, and for other purposes," and will also obey this act in respect of the crimes in said act defined and forbidden, and that he will not, directly or indirectly, aid or abet, counsel or advise, any other person to commit any of said crimes; which oath or affirmation shall be recorded in the proper office and indorsed on the commission or certificate of appointment. All grand and petit jurors in said Territory shall take the same oath or affirmation, to be administered, in writing or orally, in the proper court. No person shall be entitled to vote in any election in said Territory, or be capable of jury service, or hold any office of trust or emolument in said Territory who shall not have taken the oath or affirmation aforesaid. No person who shall have been convicted of any crime under this act, or under the act of Congress aforesaid approved March 22, 1882, or who shall be a polygamist, or who shall associate or cohabit polygamously with persons of the other sex, shall be entitled to vote in any election in said Territory, or be capable of jury service, or to hold any office of trust or emolument in said Territory.

Sec. 25. That the office of Territorial Superintendent of District Schools created by the laws of Utah is hereby abolished; and it shall be the duty of the Supreme Court of said Territory to appoint a Commissioner of Schools, who shall possess and exercise all the powers and duties heretofore imposed by the laws of said Territory upon the Territorial Superintendent of District Schools, and who shall receive the same salary and compensation, which shall be paid out of the treasury of said Territory; and the laws of the Territory of Utah providing for the method of election and appointment of such Territorial Superintendent of District Schools are hereby suspended until the further action of Congress shall be had in respect

thereto. The said superintendent shall have power to prohibit the use in any district school of any book of a sectarian character or otherwise unsuitable. Said superintendent shall collect and classify statistics and other information respecting the district and other schools in said Territory, showing their progress, the whole number of children of school age, the number who attend school in each year in the respective counties, the average length of time of their attendance, the number of teachers and the compensation paid to the same, the number of teachers who are Mormons, the number who are so-called Gentiles, the number of children of Mormon parents and the number of children of so-called Gentile parents, and their respective average attendance at school; all of which statistics and information shall be annually reported to Congress, through the Governor of said Territory and the Department of the Interior.

Sec. 26. That all religious societies, sects, and congregations shall have the right to have and to hold, through trustees appointed by any court exercising probate powers in a Territory, only on the nomination of the authorities of such society, sect, or congregation, so much real property for the erection or use of houses of worship, and for such parsonages and burial-grounds as shall be necessary for the convenience and use of the several congregations of such religious society, sect, or congregation.

Sec. 27. That all laws passed by the so-called State of Deseret and by the Legislative Assembly of the Territory of Utah for the organization of the militia thereof or for the creation of the Nauvoo Legion are hereby annulled and declared of no effect; and the militia of Utah shall be organized and subjected in all respects to the laws of the United States regulating the militia in the Territories: *Provided, however*, That all general officers of the militia shall be appointed by the Governor of the Territory, by and with the advice and consent of the Council thereof. The Legislative Assembly of Utah shall have power to pass laws for organizing the militia thereof, subject to the approval of Congress.

February 17, the House adopted the report of the Conference Committee by the following vote:

YEAS—G. E. Adams, J. J. Adams, C. H. Allen, J. M. Allen, J. A. Anderson, Atkinson, Baker, Ballentine, Barksdale, Barry, Bayne, Belmont, Bingham, Blanchard, Bliss, Blount, Bound, Boutelle, C. E. Breckinridge, C. E. Brown, W. W. Brown, Buchanan, Buck, Bunnell, Burleigh, Burrows, Butterworth, Bynum, Caldwell, J. M. Campbell, J. E. Campbell, Cannon, Caswell, Catchings, Clements, Cobb, Comstock, Conger, Cooper, W. E. Cox, Crisp, Croxton, Cutcheon, A. C. Davidson, R. H. M. Davidson, Davis, Dawson, Dingley, Dockery, Dorsey, Dunham, Eldredge, Ely, Farquhar, Fisher, Fleeger, Forney, Fuller, Funston, Gallinger, Gay, Geddes, C. H. Gibson, Giffillan, Glass, Goff, Grosvenor, Grout, Guenther, Halsell, Hammond, Harmer, Harris, Hatch, Hayden, Haynes, Heard, Hemphill, J. S. Henderson, T. J. Henderson, Henley, Hepburn, Hermann, Hiestand, Hires, Hiscock, Hitt, Holman, Holmes, Hopkins, Houk, Howard, Hutton, Jackson, James, F. A. Johnson, J. T. Johnston, T. D. Johnston, J. T. Jones, Laffoon, La Follette, Laird, Landes, Lanham, Lehlbach, Lindsley, Little, Louttit, Lyman, Mahoney, Matson, Maybury, McComas, McCreary, McKenna, McKinley, McMillin, McRae, Merriman, Millard, Moffatt, Morgan, Morrison, Morrow, Muller, Neal, Nelson, Oates, O'Donnell, O'Ferrall, Charles O'Neill, Osborne, Owen, Parker, Peel, Perkins, Peters, Pettibone, Plumb, Price, Randall, Reed, Reese, Richardson, Riggs, Robertson, Rogers, Romeis, Rowell, Ryan, Sawyer, Sayers, Seney, Sessions, Seymour, Shaw, Singleton, Smalls, Sowden, Spooner, Springer, Stahlnecker, Steele, Stephenson, J. W. Stewart, E. F. Stone, W. J. Stone of Kentucky, Storm, Strait, Struble, Swope, Symes, E. B. Taylor, I. H. Taylor, J. M.

Taylor, J. R. Thomas, O. B. Thomas, Thompson, Townshend, Van Eaton, Van Schaick, Viele, Wade, Wadsworth, Wait, Wakefield, J. H. Ward, William Warner, A. J. Weaver, J. B. Weaver, Weber, West, Wheeler, A. C. White, Milo White, Whiting, Wilkins, Willis, Winans, Wolford, Woodburn, Worthington—202.

NAYS—Barbour, Bennett, Bragg, Cabell, T. J. Campbell, Carleton, Clardy, Collins, Compton, Culberson, Daniel, Dargan, Dibble, Eden, Foran, Frederick, Hale, Hall, Hill, Irion, J. H. Jones, Kleiner, Le Fevre, Martin, Mills, Mitchell, Neece, O'Hara, J. J. O'Neill, Outwaite, Perry, Reagan, Skinner, W. J. Stone of Missouri, Tarsney, Tillman, Turner, T. B. Ward, A. J. Warner, Wilson—40.

NOT VOTING—Aiken, C. M. Anderson, Bacon, Barnes, Bland, Boyle, Brady, W. C. P. Breckinridge, T. M. Browne, Brumm, Burnes, Felix Campbell, Candler, Cowles, S. S. Cox, Crain, Curtin, Davenport, Dougherty, Dunn, Ellsberry, Ermentrout, Evans, Everhart, Felton, Findlay, Ford, Eustace Gibeon, Glover, Green, Hanback, D. B. Henderson, Herbert, Hudd, Kelley, Ketcham, King, Lawler, Libbey, Long, Lore, Lovering, Lowry, Markham, McAdoo, Miller, Milliken, Morrill, Murphy, Negley, Norwood, Payne, Payson, Phelps, Pidcock, Pindar, Ranney, Rice, Rockwell, Rusk, Sadler, Scott, Scranton, Snyder, Spriggs, Charles Stewart, St. Martin, Swinburne, Taulbee, Zachary Taylor, Throckmorton, Trigg, Tucker, Wallace, Wellborn, Wise—76.

The conference report came up for discussion in the Senate, February 18. In opposition to it Mr. Call, of Florida, said:

"This bill, in my opinion, is an anomaly on the statute-book of this country. It is the second step toward the establishment of religious persecution and intolerance. It is but a thin disguise for the acute lawyers who have prepared this bill, to assert that it is no violation of the Constitution of the United States or of the principles of civil liberty or religious tolerance upon which this Government is founded.

"Mr. President, every law has a policy, has a spirit. It is not to be determined by the letter of the law as it is sought to be justified here, and that is the very first thing a student of the law learns; and it is strange that in the Senate of the United States the very original and first principles of the profession in the interpretation of law which have been handed down for hundreds of years should be boldly violated and the Senate should declare to the professional opinion of the world that the cardinal principles of the profession have no force or effect. Why, sir, the great commentator upon law, when he teaches the student of the laws of England the manner of interpretation, cites the instance of the law in Venice, which said that he who lets blood in the streets of Venice shall be punished with death, and the example of the man who, falling in the streets with sudden illness, had his blood let by a surgeon, violating the letter of the law; but the commentator declares that the law was not violated, because its spirit must determine its interpretation. It was not violated because the spirit and the purpose of the law was to prevent the unlawful shedding of blood.

"The acute sophists who have written this bill do no credit to the intelligence of the age

or the faculty of reason when they declare in this bill that it is not violative of the Constitution, that it is not a law 'respecting an establishment of religion,' that it is not an intolerant proscription of religion, that it is not an unjust denial and discrimination between different citizens in their political rights, because the language of the bill carefully avoids the open statement of any or all these things.

"If the effect of a law—if its object and effect—accomplishes these results, then it is equally liable to the inhibition of the organic law, and of an honest and wise public policy, as if it reached these results by the use of plain and direct language.

"Now, take this act presented to the Senate, and I venture to assert that before any tribunal, impartial and rational, it can not be justified in any single provision. What shall we say of a law that undertakes to punish acts which a particular religion or sect of men worshiping God are prone to commit, violations of the laws which may, as this bill assumes, be the result of their religious belief, and that imposes penalties not demanded by the universal good of the people, but because they are committed by that particular sect of men, and imposes penalties in excess of those that are imposed for the rest of the community for the purpose of affecting that form of religious belief, with the effect by accumulated penalties of forcing that people to abandon that form of religious belief. Suppose you select some one act which your law makes a crime, which is prevalent among that people, but not peculiar to them, but which with them is a religious belief, and you impose on that act committed by them extraordinary penalties. You make the methods of trial partial, oppressive, and cruel. You make the processes of summons and arrest revoltingly harsh and arbitrary. You confiscate their church property. You interfere between parents and their children in their education, and yet you ask honorable men to believe that you think this is not legislating against a particular form of religion.

"Is that lawful? Can you extinguish by such legislation as that a form of religious belief, and yet put up the alleged plea that the letter of the law is complied with, that the Constitution is not violated? We punish all men alike, but we accumulate on that particular sect and the offenses they choose to commit penalty after penalty for the purpose of affecting that form of religious belief. Why, Mr. President, the subterfuge is unworthy of reasonable men, and can have no place in logic or in reason. 'The letter of the law killeth, but the spirit maketh alive,' said a great lawyer and an inspired man many centuries since, and from that day to this the intelligence of every age has sanctioned it. That to carry out the spirit and purpose of the law is to kill it, and to carry into effect its letter is to keep it alive; that when the letter of the law defeats

its spirit and purpose you sustain the law by defeating its spirit and purpose and adhering to the letter—who believes this, Mr. President? No intelligent person. Yet the Senate Committee on the Judiciary so declare, and this bill so declares.

"Take this bill, which is the re-establishment of the Inquisition of old, which is religious persecution, which is a law respecting the establishment of religion, because these men have a form of belief and a practice which we disapprove. It is as much the establishment of a particular religion by law as if it declared it in particular terms."

Mr. Hoar, of Massachusetts, objected to the measure on one specific point, and Senators Blair, of New Hampshire, and Dolph, of Oregon, concurred in his objection:

"I have given sometimes somewhat reluctantly my assent to the policy of this bill and to most of its provisions; but I regard, for reasons which I have already stated, the abolition of the right of suffrage by women as not merely unjustifiable but as tyrannical. I think the Senators who have had the conduct of this bill have taken an advantage which they had no right to take to strike out something they did not like, although twenty-four Senators in this body have recently recorded their opinion in its favor, by the use of the power which the public disapprobation of polygamy put into their hands for an entirely different purpose. I voted against the bill for that reason before, and I shall vote against this conference report, which is in fact a bill not merely dealing with the matters in dispute, but the original bill in a new draught, for the same reason.

"The other provisions of the bill, as being the policy which the best judgment of the Senate has been able to agree on for the extirpation of this foul blot on our civilization, I expect to support when I have an opportunity to deal with them separately, although some of them march clear up to the boundary-line which divides reasonable police legislation aimed at crime and evil from legislation which interferes with the great principles and safeguards of personal liberty. I am not prepared to go quite so far in that line."

The Senate then adopted the measure as recommended by the conference committee, by the following vote:

YEAS—Allison, Bowen, Cameron, Cheney, Cockrell, Colquitt, Conger, Cullom, Dolph, Edmunds, Evarts, Farwell, Frye, George, Hale, Harrison, Hawley, Ingalls, Jones of Arkansas, Jones of Nevada, McMillan, McPherson, Mahone, Manderson, Maxey, Miller, Mitchell of Oregon, Morgan, Morrill, Platt, Pugh, Sabin, Sawyer, Spooner, Walthall, Williams, Wilson of Iowa—37.

NAYS—Blackburn, Brown, Butler, Call, Coke, Gibson, Hampton, Harris, Hoar, Kenna, Ransom, Vance, Whithorne—18.

ABSENT—Aldrich, Beck, Berry, Blair, Camden, Chace, Daves, Eustis, Fair, Gorman, Gray, Jones of Florida, Mitchell of Pennsylvania, Palmer, Payne, Plumb, Riddleberger, Saulsbury, Sewell, Sherman, Stanford, Teller, Van Wyck, Vest, Voorhees, Wilson of Maryland—26.

The measure became a law without the approval of the President.

Interstate Commerce.—This session of Congress crowned years of apparently fruitless discussion by passing a measure regulating interstate commerce. May 12, 1886, by a vote of 46 yeas to 4 nays, the Senate passed a moderate bill for this purpose, and July 30, the House, by a vote of 180 yeas to 104 nays substituted for it the Reagan bill, and passed that measure by a vote of 190 yeas to 40 nays. July 31 the Senate non-concurred in the House amendment, and a conference committee was appointed. The report of the committee was made in the Senate, December 15, the following bill being recommended as a substitute for those passed by either House:

Be it enacted, etc., That the provisions of this act shall apply to any common carrier or carriers engaged in the transportation of passengers or property wholly by railroad, or partly by railroad and partly by water when both are used, under a common control, management, or arrangement, for a continuous carriage or shipment, from one State or Territory of the United States, or the District of Columbia, to any other State or Territory of the United States, or the District of Columbia, or from any place in the United States to an adjacent foreign country, or from any place in the United States through a foreign country to any other place in the United States, and also to the transportation in like manner of property shipped from any place in the United States to a foreign country and carried from such place to a port of transshipment, or shipped from a foreign country to any place in the United States and carried to such place from a port of entry either in the United States or an adjacent foreign country: *Provided, however,* That the provisions of this act shall not apply to the transportation of passengers or property, or to the receiving, delivering, storage, or handling of property, wholly within one State, and not shipped to or from a foreign country from or to any State or Territory as aforesaid.

The term "railroad" as used in this act shall include all bridges and ferries used or operated in connection with any railroad, and also all the road in use by any corporation operating a railroad, whether owned or operated under a contract, agreement, or lease; and the term "transportation" shall include all instrumentalities of shipment or carriage.

All charges made for any service rendered or to be rendered in the transportation of passengers or property as aforesaid, or in connection therewith, or for the receiving, delivery, storage, or handling of such property, shall be reasonable and just, and every unjust, unreasonable charge for such service is prohibited and declared to be unlawful.

Sec. 2. That if any common carrier subject to the provisions of this act shall, directly or indirectly, by any special rate, rebate, drawback, or other device, charge, demand, collect, or receive from any person or persons a greater or less compensation for any service rendered, or to be rendered, in the transportation of passengers or property, subject to the provisions of this act, than it charges, demands, collects, or receives from any other person or persons for doing for him or them a like and contemporaneous service in the transportation of a like kind of traffic under substantially similar circumstances and conditions, such common carrier shall be deemed guilty of unjust discrimination, which is hereby prohibited and declared to be unlawful.

Sec. 3. That it shall be unlawful for any common carrier subject to the provisions of this act to make or give any undue or unreasonable preference or advantage to any particular person, company, firm, corporation, or locality, or any particular description of traffic,

in any respect whatsoever, or to subject any particular person, company, firm, corporation, or locality, or any particular description of traffic, to any undue or unreasonable prejudice or disadvantage in any respect whatsoever.

Every common carrier subject to the provisions of this act shall, according to their respective powers, afford all reasonable, proper, and equal facilities for the interchange of traffic between their respective lines, and for the receiving, forwarding, and delivering of passengers and property to and from their several lines and those connecting therewith, and shall not discriminate in their rates and charges between such connecting lines; but this shall not be construed as requiring any such common carrier to give the use of its tracks or terminal facilities to another carrier engaged in like business.

Sec. 4. That it shall be unlawful for any common carrier subject to the provisions of this act to charge or receive any greater compensation in the aggregate for the transportation of passengers or of like kind of property, under substantially similar circumstances and conditions, for a shorter than for a longer distance over the same line, in the same direction, the shorter being included within the longer distance; but this shall not be construed as authorizing any common carrier within the terms of this act to charge and receive as great compensation for a shorter as for a longer distance: *Provided, however*, That upon application to the commission appointed under the provisions of this act such common carrier may, in special cases, after investigation by the commission, be authorized to charge less for longer than for shorter distances for the transportation of passengers or property; and the commission may from time to time prescribe the extent to which such designated common carrier may be relieved from the operation of this section of this act.

Sec. 5. That it shall be unlawful for any common carrier subject to the provisions of this act to enter into any contract, agreement, or combination with any other common carrier or carriers for the pooling of freights of different and competing railroads, or to divide between them the aggregate or net proceeds of the earnings of such railroads, or any portion thereof; and in any case of an agreement for the pooling of freights as aforesaid, each day of its continuance shall be deemed a separate offense.

Sec. 6. That every common carrier subject to the provisions of this act shall print and keep for public inspection schedules showing the rates and fares and charges for the transportation of passengers and property which any such common carrier has established and which are in force at the time upon its railroad, as defined by the first section of this act. The schedules printed as aforesaid by any such common carrier shall plainly state the places upon its railroad between which property and passengers will be carried, and shall contain the classification of freight in force upon such railroad, and shall also state separately the terminal charges and any rules or regulations which in any wise change, affect, or determine any part of the aggregate of such aforesaid rates and fares and charges. Such schedules shall be plainly printed in large type, of at least the size of ordinary pica, and copies for the use of the public shall be kept in every depot or station upon any such railroad, in such places and in such form that they can be conveniently inspected.

Any common carrier subject to the provisions of this act receiving freight in the United States to be carried through a foreign country to any place in the United States shall also in like manner print and keep for public inspection, at every depot where such freight is received for shipment, schedules showing the through rates established and charged by such common carrier to all points in the United States beyond the foreign country to which it accepts freight for shipment; and any freight shipped from the United States through a foreign country into the United States, the through rate on which shall not have been made public as required by this act, shall, before it is admitted into the

United States from said foreign country, be subject to customs duties as if said freight were of foreign production; and any law in conflict with this section is hereby repealed.

No advance shall be made in the rates, fares, and charges which have been established and published as aforesaid by any common carrier in compliance with the requirements of this section, except after ten days' public notice, which shall plainly state the changes proposed to be made in the schedule then in force, and the time when the increased rates, fares, or charges will go into effect; and the proposed changes shall be shown by printing new schedules, or shall be plainly indicated upon the schedules in force at the time and kept for public inspection. Reductions in such published rates, fares, or charges may be made without previous public notice; but whenever any such reduction is made, notice of the same shall immediately be publicly posted and the changes made shall immediately be made public by printing new schedules, or shall immediately be plainly indicated upon the schedules at the time in force and kept for public inspection.

And when any such common carrier shall have established and published its rates, fares, and charges in compliance with the provisions of this section, it shall be unlawful for such common carrier to charge, demand, collect, or receive from any person or persons a greater or less compensation for the transportation of passengers or property, or for any services in connection therewith, than is specified in such published schedule of rates, fares, and charges as may at the time be in force.

Every common carrier subject to the provisions of this act shall file with the commission hereinafter provided for copies of its schedules of rates, fares, and charges which have been established and published in compliance with the requirements of this section, and shall promptly notify said commission of all changes made in the same. Every such common carrier shall also file with said commission copies of all contracts, agreements, or arrangements with other common carriers in relation to any traffic affected by the provisions of this act to which it may be a party. And in cases where passengers and freight pass over continuous lines or routes operated by more than one common carrier, and the several common carriers operating such lines or routes establish joint tariffs of rates or fares or charges for such continuous lines or routes, copies of such joint tariffs shall also, in like manner, be filed with said commission. Such joint rates, fares, and charges on such continuous lines so filed as aforesaid shall be made public by such common carriers when directed by said commission, in so far as may, in the judgment of the commission, be deemed practicable; and said commission shall from time to time prescribe the measure of publicity which shall be given to such rates, fares, and charges, or to such part of them as it may deem it practicable for such common carriers to publish, and the places in which they shall be published; but no common carrier party to any such joint tariff shall be liable for the failure of any other common carrier party thereto to observe and adhere to the rates, fares, or charges thus made and published.

If any such common carrier shall neglect or refuse to file or publish its schedules or tariffs of rates, fares, and charges as provided in this section, or any part of the same, such common carrier shall, in addition to other penalties herein prescribed, be subject to a writ of mandamus, to be issued by any circuit court of the United States in the judicial district wherein the principal office of said common carrier is situated or wherein such offense may be committed, and if such common carrier be a foreign corporation, in the judicial circuit wherein such common carrier accepts traffic and has an agent to perform such service, to compel compliance with the aforesaid provisions of this section; and such writ shall issue in the name of the people of the United States, at the relation of the

commissioners appointed under the provisions of this act; and failure to comply with its requirements shall be punishable as and for a contempt; and the said commissioners, as complainants, may also apply, in any such circuit court of the United States, for a writ of injunction against such common carrier, to restrain such common carrier from receiving or transporting property among the several States and Territories of the United States, or between the United States and adjacent foreign countries, or between ports of transshipment and of entry and the several States and Territories of the United States, as mentioned in the first section of this act, until such common carrier shall have complied with the aforesaid provisions of this section of this act.

Sec. 7. That it shall be unlawful for any common carrier subject to the provisions of this act to enter into any combination, contract, or agreement, expressed or implied, to prevent, by change of time schedule, carriage in different cars, or by other means or devices, the carriage of freights from being continuous from the place of shipment to the place of destination; and no break of bulk, stoppage, or interruption made by such common carrier shall prevent the carriage of freights from being and being treated as one continuous carriage from the place of shipment to the place of destination, unless such break, stoppage, or interruption was made in good faith for some necessary purpose, and without any intent to avoid or unnecessarily interrupt such continuous carriage or to evade any of the provisions of this act.

Sec. 8. That in case any common carrier subject to the provisions of this act shall do, cause to be done, or permit to be done any act, matter, or thing in this act prohibited or declared to be unlawful, or shall omit to do any act, matter, or thing in this act required to be done, such common carrier shall be liable to the person or persons injured thereby for the full amount of damages sustained in consequence of any such violation of the provisions of this act, together with a reasonable counsel or attorney's fee, to be fixed by the court in every case of recovery, which attorney's fee shall be taxed and collected as part of the costs in the case.

Sec. 9. That any person or persons claiming to be damaged by any common carrier subject to the provisions of this act may either make complaint to the commission as hereinafter provided for, or may bring suit in his or their own behalf for the recovery of the damages for which such common carrier may be liable under the provisions of this act, in any district or circuit court of the United States of competent jurisdiction; but such person or persons shall not have the right to pursue both of said remedies, and must in each case elect which one of the two methods of procedure herein provided for he or they will adopt. In any such action brought for the recovery of damages the court before which the same shall be pending may compel any director, officer, receiver, trustee, or agent of the corporation or company defendant in such suit to attend, appear, and testify in such case, and may compel the production of the books and papers of such corporation or company party to any such suit; the claim that any such testimony or evidence may tend to criminate the person giving such evidence shall not excuse such witness from testifying, but such evidence or testimony shall not be used against such person on the trial of any criminal proceeding.

Sec. 10. That any common carrier subject to the provisions of this act, or, whenever such common carrier is a corporation, any director or officer thereof, or any receiver, trustee, lessee, agent, or person acting for or employed by such corporation, who, alone or with any other corporation, company, person, or party, shall willfully do or cause to be done, or shall willingly suffer or permit to be done, any act, matter, or thing in this act prohibited or declared to be unlawful, or who shall aid or abet therein, or shall willfully omit or fail to do any act, matter, or thing in this act required to be done, or shall cause or willingly

ly suffer or permit any act, matter or thing so directed or required by this act to be done not to be so done, or shall aid or abet any such omission or failure, or shall be guilty of any infraction of this act, or shall aid or abet therein, shall be deemed guilty of a misdemeanor, and shall, upon conviction thereof in any district court of the United States within the jurisdiction of which such offense was committed, be subject to a fine of not to exceed \$5,000 for each offense.

Sec. 11. That a commission is hereby created and established, to be known as the Interstate Commerce Commission, which shall be composed of five commissioners, who shall be appointed by the President, by and with the advice and consent of the Senate. The commissioners first appointed under this act shall continue in office for the term of two, three, four, five, and six years, respectively, from the 1st day of January, A. D. 1887, the term of each to be designated by the President; but their successors shall be appointed for terms of six years, except that any person chosen to fill a vacancy shall be appointed only for the unexpired term of the commissioner whom he shall succeed. Any commissioner may be removed by the President for inefficiency, neglect of duty, or malfeasance in office. Not more than three of the commissioners shall be appointed from the same political party. No person in the employ of, or holding any official relation to, any common carrier subject to the provisions of this act, or owning stock or bonds thereof, or who is in any way pecuniarily interested therein, shall enter upon the duties of or hold such office. Said commissioners shall not engage in any other business, vocation, or employment. No vacancy in the commission shall impair the right of the remaining commissioners to exercise all the powers of the commission.

Sec. 12. That the commission hereby created shall have authority to inquire into the management of the business of all common carriers subject to the provisions of this act, and shall keep itself informed as to the manner and method in which the same is conducted, and shall have the right to obtain from such common carriers full and complete information necessary to enable the commission to perform the duties and carry out the objects for which it was created; and for the purposes of this act the commission shall have power to require the attendance and testimony of witnesses and the production of all books, papers, tariffs, contracts, agreements, and documents relating to any matter under investigation, and to that end may invoke the aid of any court of the United States in requiring the attendance and testimony of witnesses and the production of books, papers, and documents under the provisions of this section.

And any of the circuit courts of the United States within the jurisdiction of which such inquiry is carried on may, in case of contumacy or refusal to obey a subpoena issued to any common carrier subject to the provisions of this act, or other person, issue an order requiring such common carrier or other person to appear before said commission (and produce books and papers if so ordered) and give evidence touching the matter in question; and any failure to obey such order of the court may be punished by such court as a contempt thereof. The claim that any such testimony or evidence may tend to criminate the person giving such evidence shall not excuse such witness from testifying; but such evidence or testimony shall not be used against such person on the trial of any criminal proceeding.

Sec. 13. That any person, firm, corporation, or association, or any mercantile, agricultural, or manufacturing society, or any body politic or municipal organization, complaining of anything done or omitted to be done by any common carrier subject to the provisions of this act in contravention of the provisions thereof, may apply to said commission by petition, which shall briefly state the facts; whereupon a statement of the charges thus made shall be forwarded by the commission to such common carrier, who shall be

called upon to satisfy the complaint or to answer the same in writing within a reasonable time, to be specified by the commission. If such common carrier, within the time specified, shall make reparation for the injury alleged to have been done, said carrier shall be relieved of liability to the complainant only for the particular violation of law thus complained of. If such carrier shall not satisfy the complaint within the time specified, or there shall appear to be any reasonable ground for investigating said complaint, it shall be the duty of the commission to investigate the matters complained of in such manner and by such means as it shall deem proper.

Said commission shall in like manner investigate any complaint forwarded by the railroad commissioner or railroad commission of any State or Territory, at the request of such commissioner or commission, and may institute any inquiry on its own motion in the same manner and to the same effect as though complaint had been made.

No complaint shall at any time be dismissed because of the absence of direct damage to the complainant.

Sec. 14. That whenever an investigation shall be made by said commission, it shall be its duty to make a report in writing in respect thereto, which shall include the findings of fact upon which the conclusions of the commission are based, together with its recommendation as to what reparation, if any, should be made by the common carrier to any party or parties who may be found to have been injured; and such findings so made shall thereafter, in all judicial proceedings, be deemed *prima-facie* evidence as to each and every fact found.

All reports of investigations made by the commission shall be entered of record, and a copy thereof shall be furnished to the party who may have complained, and to any common carrier that may have been complained of.

Sec. 15. That if in any case in which an investigation shall be made by said commission it shall be made to appear to the satisfaction of the commission, either by the testimony of witnesses or other evidence, that anything has been done or omitted to be done in violation of the provisions of this act, or of any law cognizable by said commission, by any common carrier, or that any injury or damage has been sustained by the party or parties complaining, or by other parties aggrieved in consequence of any such violation, it shall be the duty of the commission to forthwith cause a copy of its report in respect thereto to be delivered to such common carrier, together with a notice to said common carrier to cease and desist from such violation, or to make reparation for the injury so found to have been done, or both, within a reasonable time, to be specified by the commission; and if, within the time specified, it shall be made to appear to the commission that such common carrier has ceased from such violation of law, and has made reparation for the injury found to have been done, in compliance with the report and notice of the commission, or to the satisfaction of the party complaining, a statement to that effect shall be entered of record by the commission, and the said common carrier shall thereupon be relieved from further liability or penalty for such particular violation of law.

Sec. 16. That whenever any common carrier, as defined in and subject to the provisions of this act, shall violate or refuse or neglect to obey any lawful order or requirement of the commission in this act named, it shall be the duty of the commission, and lawful for any company or person interested in such order or requirement, to apply, in a summary way, by petition, to the Circuit Court of the United States sitting in equity in the judicial district in which the common carrier complained of has its principal office, or in which the violation or disobedience of such order or requirement shall happen, alleging such violation or disobedience, as the case may be; and the said court shall have power to hear and determine the matter,

on such short notice to the common carrier complained of as the court shall deem reasonable; and such notice may be served on such common carrier, his or its officers, agents, or servants, in such manner as the court shall direct; and said court shall proceed to hear and determine the matter speedily as a court of equity and without the formal pleadings and proceedings applicable to ordinary suits in equity, but in such manner as to do justice in the premises; and to this end such court shall have power, if it think fit, to direct and prosecute, in such mode and by such persons as it may appoint, all such inquiries as the court may think needful to enable it to form a just judgment in the matter of such petition; and on such hearing the report of said commission shall be *prima-facie* evidence of the matters therein stated; and if it be made to appear to such court, on such hearing or on report of any such person or persons, that the lawful order or requirement of said commission drawn in question has been violated or disobeyed, it shall be lawful for such court to issue a writ of injunction or other proper process, mandatory or otherwise, to restrain such common carrier from further continuing such violation or disobedience of such order or requirement of said commission, and enjoining obedience to the same; and in case of any disobedience of any such writ of injunction or other proper process, mandatory or otherwise, it shall be lawful for such court to issue writs of attachment, or any other process of said court incident or applicable to writs of injunction or other proper process, mandatory or otherwise, against such common carrier, and if a corporation, against one or more of the directors, officers, or agents of the same, or against any owner, lessee, trustee, receiver, or other person failing to obey such writ of injunction or other proper process, mandatory or otherwise; and said court may, if it shall think fit, make an order directing such common carrier or other person so disobeying such writ of injunction or other proper process, mandatory or otherwise, to pay such sum of money not exceeding for each carrier or person in default the sum of \$500 for every day after a day to be named in the order that such carrier or other person shall fail to obey such injunction or other proper process, mandatory or otherwise; and such moneys shall be payable as the court shall direct, either to the party complaining, or into court to abide the ultimate decision of the court, or into the Treasury; and payment thereof may, without prejudice to any other mode of recovering the same, be enforced by attachment or order in the nature of a writ of execution, in like manner as if the same had been recovered by a final decree *in personam* in such court. When the subject in dispute shall be of the value of \$2,000 or more, either party to such proceeding before said court may appeal to the Supreme Court of the United States, under the same regulations now provided by law in respect of security for such appeal; but such appeal shall not operate to stay or supersede the order of the court or the execution of any writ or process thereon; and such court may, in every such matter, order the payment of such costs and counsel fees as shall be deemed reasonable. Whenever any such petition shall be filed or presented by the commission it shall be the duty of the district attorney, under the direction of the Attorney-General of the United States, to prosecute the same; and the costs and expenses of such prosecution shall be paid out of the appropriation for the expenses of the courts of the United States. For the purposes of this act, excepting its penal provisions, the circuit courts of the United States shall be deemed to be always in session.

Sec. 17. That the commission may conduct its proceedings in such a manner as will best conduce to the proper dispatch of business and to the ends of justice. A majority of the commission shall constitute a quorum for the transaction of business, but no commissioner shall participate in any hearing or proceeding in which he has any pecuniary interest. Said com-

mission may, from time to time, make or amend such general rules or orders as may be requisite for the order and regulation of proceedings before it, including forms of notices and the service thereof, which shall conform, as nearly as may be, to those in use in the courts of the United States. Any party may appear before said commission and be heard, in person or by attorney. Every vote and official act of the commission shall be entered of record, and its proceedings shall be public upon the request of either party interested. Said commission shall have an official seal, which shall be judicially noticed. Either of the members of the commission may administer oaths and affirmations.

Sec. 18. That each commissioner shall receive an annual salary of \$7,500, payable in the same manner as the salaries of judges of the courts of the United States. The commission shall appoint a secretary, who shall receive an annual salary of \$3,500, payable in like manner. The commission shall have authority to employ and fix the compensation of such other employees as it may find necessary to the proper performance of its duties, subject to the approval of the Secretary of the Interior.

The commission shall be furnished by the Secretary of the Interior with suitable offices and all necessary office supplies. Witnesses summoned before the commission shall be paid the same fees and mileage that are paid witnesses in the courts of the United States. All of the expenses of the commission, including all necessary expenses for transportation incurred by the commissioners, or by their employees under their orders, in making any investigation in any other places than in the city of Washington, shall be allowed and paid, on the presentation of itemized vouchers therefor approved by the chairman of the commission and the Secretary of the Interior.

Sec. 19. That the principal office of the commission shall be in the city of Washington, where its general sessions shall be held; but whenever the convenience of the public or of the parties may be promoted or delay or expense prevented thereby, the commission may hold special sessions in any part of the United States. It may, by one or more of the commissioners, prosecute any inquiry necessary to its duties, in any part of the United States, into any matter or question of fact pertaining to the business of any common carrier subject to the provisions of this act.

Sec. 20. That the commission is hereby authorized to require annual reports from all common carriers subject to the provisions of this act, to fix the time and prescribe the manner in which such reports shall be made, and to require from such carriers specific answers to all questions upon which the commission may need information. Such annual reports shall show in detail the amount of capital stock issued, the amounts paid therefor, and the manner of payment for the same; the dividends paid, the surplus fund, if any, and the number of stockholders; the funded and floating debts, and the interest paid thereon; the cost and value of the carrier's property, franchises, and equipment; the number of employees, and the salary paid each class; the amounts expended for improvements each year, how expended, and the character of such improvements; the earnings and receipts from each branch of business and from all sources; the operating and other expenses; the balances of profit and loss; and a complete exhibit of the financial operations of the carrier each year, including an annual balance-sheet. Such reports shall also contain such information in relation to rates or regulations, concerning fares or freights, or agreements, arrangements, or contracts with other common carriers, as the commission may require; and the said commission may, within its discretion, for the purpose of enabling it the better to carry out the purposes of this act, prescribe (if in the opinion of the commission it is practicable to prescribe such uniformity and methods of keeping accounts) a period of time within which all common carriers subject to the provisions of this

act shall have, as near as may be, a uniform system of accounts, and the manner in which such accounts shall be kept.

Sec. 21. That the commission shall, on or before the 1st day of December in each year, make a report to the Secretary of the Interior, which shall be by him transmitted to Congress, and copies of which shall be distributed as are the other reports issued from the Interior Department. This report shall contain such information and data collected by the commission as may be considered of value in the determination of questions connected with the regulation of commerce, together with such recommendations as to additional legislation relating thereto as the commission may deem necessary.

Sec. 22. That nothing in this act shall apply to the carriage, storage, or handling of property free or at reduced rates for the United States, State, or municipal governments, or for charitable purposes, or to or from fairs and expositions for exhibition thereat, or the issuance of mileage, excursion, or commutation passenger tickets; nothing in this act shall be construed to prohibit any common carrier from giving reduced rates to ministers of religion; nothing in this act shall be construed to prevent railroads from giving free carriage to their own officers and employees, or to prevent the principal officers of any railroad company or companies from exchanging passes or tickets with other railroad companies for their officers and employees; and nothing in this act contained shall in any way abridge or alter the remedies now existing at common law or by statute, but the provisions of this act are in addition to such remedies: *Provided*, That no pending litigation shall in any way be affected by this act.

Sec. 23. That the sum of \$100,000 is hereby appropriated for the use and purposes of this act for the fiscal year ending June 30, A. D. 1888, and the intervening time anterior thereto.

Sec. 24. That the provisions of sections 11 and 18 of this act, relating to the appointment and organization of the commission herein provided for shall take effect immediately, and the remaining provisions of this act shall take effect sixty days after its passage.

After extended discussion, the Senate agreed to the Conference Committee's report, Jan. 14, 1887, by the following vote:

YEAS—Allison, Beck, Berry, Blackburn, Bowen, Cockrell, Coke, Colquitt, Conger, Cullom, Dolph, Edmunds, Eustis, Fair, Frye, George, Gibson, Gorman, Gray, Hale, Harris, Hawley, Ingalls, Jones of Arkansas, Jones of Nevada, McMillan, Manderson, Mitchell of Oregon, Palmer, Plumb, Pugh, Sabin, Saulsbury, Sawyer, Sewell, Sherman, Spooner, Teller, Vance, Vest, Walthall, Whitthorne, Wilson of Iowa—48.

NAYS—Aldrich, Blair, Brown, Cameron, Chace, Cheney, Evarts, Hampton, Hoar, Mahone, Mitchell of Pennsylvania, Morrill, Payne, Platt, Williams—15.

ABSENT—Butler, Call, Camden, Dawes Harrison, Jones of Florida, Kenna, McPherson, Maxey, Miller, Morgan, Ransom, Riddleberger, Stanford, Van Wyck, Voorhees, Wilson of Maryland—17.

Just previous to the final vote, a motion to recommit was lost, as follows:

YEAS—Aldrich, Blair, Brown, Cameron, Chace, Cheney, Evarts, Frye, Gray, Hale, Hampton, Hawley, Hoar, Mahone, Mitchell of Oregon, Mitchell of Pennsylvania, Morgan, Morrill, Payne, Platt, Sawyer, Sewell, Sherman, Spooner, Williams—25.

NAYS—Allison, Beck, Berry, Blackburn, Bowen, Call, Cockrell, Coke, Colquitt, Conger, Cullom, Dolph, Edmunds, Eustis, Fair, George, Gibson, Gorman, Harris, Ingalls, Jones of Arkansas, Jones of Nevada, McMillan, Manderson, Palmer, Plumb, Pugh, Sabin, Saulsbury, Teller, Vance, Vest, Walthall, Whitthorne, Wilson of Iowa, Wilson of Maryland—36.

ABSENT—Butler, Camden, Dawes, Harrison, Jones of Florida, Kenna, McPherson, Maxey, Miller, Ransom, Riddleberger, Stanford, Van Wyck, Voorhees—14.

In the House, Jan. 21, 1887, the conference committee's report was agreed to by the following vote:

YEAS—G. E. Adams, J. J. Adams, J. M. Allen, J. A. Anderson, Baker, Ballentine, Barbour, Barksdale, Barnes, Barry, Bayne, Belmont, Bennett, Blanchard, Blount, Bound, Brady, C. R. Breckinridge, W. C. P. Breckinridge, C. E. Brown, W. W. Brown, Buck, Bunnell, Burnes, Burrows, Butterworth, Bynum, Cabell, Caldwell, Felix Campbell, J. M. Campbell, Cannon, Carleton, Catobings, Clements, Collins, Compton, Comstock, Conger, Cooper, Cowles, W. R. Cox, Crain, Crisp, Croxton, Culberson, Curtin, Cutcheon, Daniel, R. H. M. Davidson, Dawson, Dingley, Dockery, Dorsey, Dougherty, Dunham, Dunn, Eden, Eldredge, Ellisberry, Everhart, Farquhar, Fisher, Fleege, Foran, Fuller, Funston, Gallinger, Geddes, C. H. Gibson, Glover, Goff, Green, Grout, Hale, Hall, Hallsell, Hammond, Harmer, Harris, Hatch, Haynes, Heard, Hemphill, D. B. Henderson, J. S. Henderson, T. J. Henderson, Henley, Hepburn, Herbert, Hermann, Hiestand, Hires, Hitt, Holman, Holmes, Hopkins, Howard, Hudd, Irion, J. T. Johnston, T. D. Johnston, J. H. Jones, J. T. Jones, Laffoon, La Follette, Landes, Lanham, Lawler, Le Fevre, Lehlbach, Lindsley, Little, Lore, Louttit, Lovering, Lowry, Lyman, Mahoney, Matson, McAdoo, McComas, McCreary, McKinley, McMillin, McRae, Millard, Milliken, Mills, Moffatt, Morrill, Morrison, Muller, Murphy, Neal, Neece, Nelson, Norwood, O'Donnell, O'Ferrall, Osborne, Outhwaite, Owen, Parker, Payson, Peel, Perkins, Perry, Peters, Pettibone, Phelps, Piroe, Plumb, Randall, Richardson, Riggs, Robertson, Rockwell, Rogers, Romeis, Rowell, Ruak, Ryan, Sadler, Sawyer, Sayers, Scott, Scranton, Sessions, Shaw, Singleton, Skinner, Sowden, Spooner, Springer, Steele, Stephenson, Charles Stewart, W. NOR VOICE—Aiken, Atkinson, Bacon, Bingham, Bland, T. M. Browne, Buchanan, Burleigh, T. J. Campbell, Chandler, Clardy, Cobb, S. S. Cox, Dargan, Davenport, A. C. Davidson, Davis, Ermentrout, Ford, Forney, Eustace Gibson, Glass, Guenther, Hanback, Hiscock, Houk, Hutton, Jackson, James, King, Kleiner, Laird, Maybury, Merriman, Mitchell, Morgan, Negley, O'Hara, Payne, Pidecock, Pindar, Reagan, Reese, Seney, Smalls, Snyder, Spriggs, Stahlnecker, J. W. Stewart, St. Martin, E. F. Stone, Swinburne, Throckmorton, Viele, A. J. Weaver, West, Whiting, Wise—68.

Feb. 4, 1887, the President approved of the measure.

Non-Intercourse.—Jan. 19, 1887, a bill was reported in the Senate from the Committee on Foreign Relations, "to authorize the President of the United States to protect and defend the rights of American fishing-vessels, Ameri-

can fishermen, American trading and other vessels in certain cases, and for other purposes." January 24 it passed the Senate by a vote of 45 to 1, the negative vote being cast by Senator Riddleberger, of Virginia. The measure is as follows:

Be it enacted, etc., That whenever the President of the United States shall be satisfied that American fishing-vessels or American fishermen, visiting or being in the waters or at any ports or places of the British dominions of North America, are or then lately have been denied or abridged in the enjoyment of any rights secured to them by treaty or law, or are or then lately have been unjustly vexed or harassed in the enjoyment of such rights, or subjected to unreasonable restrictions, regulations, or requirements in respect of such rights, or otherwise unjustly vexed or harassed in said waters, ports, or places; or whenever the President of the United States shall be satisfied that any such fishing-vessels or fishermen, having a permit under the laws of the United States to touch and trade at any port or ports, place or places in the British dominions of North America, are or then lately have been denied the privilege of entering such port or ports, place or places, in the same manner and under the same regulations as may exist therein applicable to trading-vessels of the most favored nation, or shall be unjustly vexed or harassed in respect thereof, or otherwise be unjustly vexed or harassed therein, or shall be prevented from purchasing such supplies as may there be lawfully sold to trading-vessels of the most favored nation; or whenever the President of the United States shall be satisfied that any other vessels of the United States, their masters or crews, so arriving at or being in such British waters or ports or places of the British dominions in North America, are or then lately have been denied any of the privileges therein accorded to the vessels, their masters or crews, of the most favored nation, or unjustly vexed or harassed in respect to the same, or unjustly vexed or harassed therein by the authorities thereof, then, and in either or all of such cases, it shall be lawful, and it shall be the duty of the President of the United States, in his discretion, by proclamation to that effect, to deny vessels, their masters and crews, of the British dominions of North America any entrance into the waters, ports, or places of or within the United States (with such exceptions in regard to vessels in distress, stress of weather, or needing supplies as to the President shall seem proper), whether such vessels have come directly from said dominions on such destined voyage or by way of some port or place in such destined voyage elsewhere; and also to deny entry into any port or place of the United States of fresh fish or salt fish or any other product of said dominions, or other goods coming from said dominions to the United States. The President may, in his discretion, apply such proclamation to any part or to all of the foregoing-named subjects, and revoke, qualify, limit and renew such proclamation from time to time as he may deem necessary to the full and just execution of the purposes of this act. Every violation of any such proclamation, or any part thereof, is hereby declared illegal, and all vessels and goods so coming or being within the waters, ports, or places of the United States contrary to such proclamation shall be forfeited to the United States; and such forfeitures shall be enforced and proceeded upon in the same manner and with the same effect as in the case of vessels or goods whose importation or coming to or being in the waters or ports of the United States contrary to law may now be enforced and proceeded upon. Every person who shall violate any of the provisions of this act, or such proclamation of the President made in pursuance hereof, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine not exceeding \$1,000, or by imprisonment for a term not exceeding two years, or by both said punishments, in the discretion of the court.

In explanation of the measure, Senator Edmunds, of Vermont, said: "This bill provides that if our vessels are mistreated in Canadian ports—pure fishing-vessels, I will stick to that now, for the time being—and are denied or embarrassed in the fair exercise of the rights that they have, the President of the United States may, as a countervailing operation, say that the Canadian fish, and the Canadian fisherman, and the Canadian trader, and the Canadian everybody else, shall not come into the waters of the United States at all. Suppose he says that; that is not war. Suppose it continues for ten years; it is a question of who can stand it best. I think the people of the United States can stand it best, and it will be a persuasion to those people to mitigate accordingly somewhat of the rough asperity of their manners and somewhat of the irregularity of their conduct. Suppose it does not. Then you have simply got non-intercourse between the British provinces and the United States. The question is, short of war, who can stand that the longest. I think there can be but one answer to that proposition.

"So the question whether we have got to fight to protect American fishermen in their rights that they are entitled to under the treaty alone, as I said before, is not a question at this present moment or this present year of any war, but it is a question of countervailing regulations which all nations have resorted to long before, and usually never coming to a war afterward, in respect of adjusting these rights.

"The very matter of these fisheries has been for a hundred years carried on in the same way. Her Majesty's Government have, from time to time, made their regulations or authorized them to be made, and they have been made and they have executed them, and the Congress of the United States has authorized the President, under our laws, to adjust his conduct accordingly as to whether they could come here or whether they could not. So it is no new thing; and it is not war. There may be war if, by-and-by, it is found that it is impossible for these countries to adjust this matter under clear and definite rights as they now exist, and one party or the other may go to war. The British Government may say, "If you do not choose to admit Dominion vessels into the United States which you are under no treaty obligation to do, we will go to war with you," as we might with China, because she will not admit American vessels into every one of her ports and places; but that is a very ultimate and a very far-off question."

Senator Ingalls, of Kansas, took a less pacific view of the controversy. He said: "It may be that the British Government, by these unwarranted seizures and atrocities, outrages and wrongs, admitted to be in violation of that treaty, have had no ulterior purpose except to compel us to accept their construction of that treaty, to subject us to duress and coercion to force the United States to admit their interpre-

tations of the marine league, of the rights of the fishermen, of the rights of shelter, water, food, and fuel were such as they proposed to put upon them. But I do not read these transactions in that way; the American people do not read them in that way. There was some design and purpose other than to obtain a peaceful solution of the question of the construction or interpretation of doubtful provisions of the Treaty of 1818.

"Sir, England has always been the ruffian, the coward, and the bully among the nations of the earth; insolent to the weak, arrogant to the feeble, cringing and obsequious to the strong, her history for centuries has been a record of crimes against the human race. In Ireland, in Scotland and Wales, against the Roman Catholics, against the Boers of South Africa, against the Hindoos and the Chinese, against the Afghans, the Persians, and the Egyptians, wherever there has been a feeble and helpless people, Great Britain has appeared for the purpose of rapacity, plunder, and conquest.

"England bears no good-will to this country. The memory of defeat in two wars rankles, I have no doubt, in the breasts of Englishmen. When I say that Great Britain is not friendly to America, I mean that the ruling classes are not, and that they have never been.

"Their course toward us has uniformly been one of supercilious insolence and of outrage. They cheated the South with false hopes of recognition, and they outraged the North by violating the rights of neutrality. Their action in the Treaty of Washington was controlled solely by a fear of the consequences to their own commerce in the next war in which they might be engaged if they permitted the precedent that they had established to stand undenied.

"I believe that there is no special reciprocity and good-will on the part of America toward England. There are few Americans who do not regret Waterloo. There are few Americans who do not recognize the fact that the conduct of Great Britain toward this country has been characterized by jealousy and in-leveillance from the beginning of our national existence, and that she is our only enemy among the powers of the earth.

"If I read these transactions aright, there is no desire on the part of Great Britain to secure a peaceful solution, a pacific interpretation of the doubtful provisions of the Treaty of 1818, but a deliberate design to so far foment the irritation, the discontent that exists between the United States of America and the Dominion of Canada, as to prevent the pacific political affiliations of those two powers in the immediate future, which would be inevitable if it were left to the operation of the natural laws of politics, of trade, and of society.

"I think I discern very plainly what the purpose of Great Britain has been in this matter. She means to render it impossible for free, friendly, reciprocal relations, political and

other, to exist between Canada and the United States."

Mr. Hoar, of Massachusetts, regarded the action of the Canadian authorities as shaped to procure a modification of American tariff laws. He said: "I do not think there will be any very great necessity for further argument in support of this bill to convince the minds of a majority of Senators of the expediency of the measure. But the State which I represent is more interested five times over than all the other communities together in the immediate controversy. Of the vessels which have experienced the outrages and annoyances recited in the report of the committee, twenty-five belong to the State of Massachusetts besides four whose port is not stated, and seven to the State of Maine, formerly a part of Massachusetts.

"I understand that the object of these annoyances and grievances which have been recited in the report of the committee is not principally or largely to assert the British or Canadian interpretation of the Treaty of 1818. A dispute is sought in regard to the terms of that treaty, not to protect the sources of the fisheries from an interference by Massachusetts or Maine competition, but it is to compel the people of the United States to change their laws in a matter of purely domestic concern. It is not that Canada may catch fish without molestation; it is that she may sell fish without the interference of the American tariff policy that these difficulties are fomented.

"I regard, in that point of view, the attempt by a foreign country by hostile interference with our ships on the high-seas, or in the neighborhood of their ports, or in their ports, to enforce upon us, against our will, a certain domestic policy as being one of the most emphatic and flagrant acts of hostility that can be committed without actual war. These seizures, with the exception, perhaps, of one or two instances, are seizures upon a pretense and without the reality of any interference either with treaty or with local regulation or law by the American vessels.

"This attempt on the part of Canada has received, as is apparent from the diplomatic correspondence, the full countenance of the mother-country, of which Canada is a dependent. It is said that in one instance there has been an expression of regret for the actual lowering of the American flag. I do not see that the lowering of the American flag is in substance an offense at all equal in rank, of which we have any more reason to complain, than the taking custody without actual right of American vessels and their masters and crews when they are about their lawful employment. It is an affront undoubtedly; it is an insult; but the substance of the offense is not the lowering of the flag, but is the seizure of the ship whose nationality the flag protects.

"The apology which has been conveyed to us is not the apology which is due for the out-

rage. There is no apology on the part of Great Britain, but a simple communication to us by the British minister of an expression of regret of the local dependency, with which we can have no diplomatic relations, and whose satisfaction or dissatisfaction with the act of the officer is of no sort of importance. The absence of any other expression of regret, either for the single action to which this relates or for a series of offenses or outrages of which that is but one, is a more significant matter, as it seems to me, than the single expression which has been communicated to our Secretary of State by the British representative to this country.

"I do not understand, with the Senator from Kansas, that the object of this measure is to bring about either a war on one side or new diplomacy or negotiation on the other. All that is to be done is that we say to Great Britain, and to the Dominion of Canada through her, that so far from accomplishing anything in the way of diminution, or lightening, or repeal of our customs duties by this course of conduct, so long as it continues you shall not be permitted to sell your fish or any other product of the offending district in the American market.

"The only answer to this measure which is to be expected, and all that will be expected, and which will be effectual, is a communication of Great Britain that she has given orders that this course of offensive proceeding shall stop. It requires no new treaty, and certainly, I think, requires no further exertion of force on the part of the American Government."

Senator Morgan, of Alabama, argued that the great issue is the interpretation of the Treaty of 1818. He said: "The committee in preparing the bill and bringing it forward in the Senate first took into consideration what was the actual condition of the treaty relations between the United States and Great Britain respecting the British provinces in North America, and a very close, narrow investigation of the whole field of inquiry satisfied us that we were entirely without treaty engagements with Great Britain in respect of our commerce with the Canadian Dominion. It is true that in the Treaty of Washington we have mutual stipulations in respect of transportation, liable to be suspended, I believe, upon two years' notice or upon the failure of either Government to carry out in good faith, according to the opinion of the other Government, the provisions of those mutual stipulations. But the Senate will do well to remember, in approaching this question and in deciding what is its duty in respect of it, that the United States have no commercial engagements with Great Britain with reference to our commerce with the Canadian provinces. Our engagements are limited to what I have already stated and to the Treaty of 1818 relating to the fisheries. The relations between

the United States and the provinces of Canada depend entirely upon the statutes of the two countries, and not upon any treaty engagements; so that in legislating upon this question we have an open field in which we are permitted to exercise our own sweet will without question on the part of Great Britain. We can establish by act of Congress any of the ordinances that we see proper for the regulation of our commercial relations with those provinces, and so they can do the same thing.

"When two countries, thus neighbors to each other, are thus situated in respect of their treaty obligations and are left only to provide for their mutual interests by legislation, it is very clear that if the Dominion of Canada, backed by the Government of Great Britain, shall legislate in hostility to our trade, it becomes not only our duty but our only alternative to legislate in hostility to theirs, to legislate according to the principles of retaliation and of retaliation, if you please.

"If we had commercial treaties with Great Britain respecting our relations to the Canadian provinces, we should of course be attempting to understand whether the proposed legislation of the Committee on Foreign Relations was in any sense in conflict with those commercial regulations agreed upon by treaty; but having nothing of the kind, as I before observed, the field is entirely open to us, and we have no alternative but either to negotiate our first treaty of commerce with Great Britain in respect of the provinces, or to go on in the old line of legislating *pro* and *con* so as to balance up our interests and make them mutually agreeable.

"It is not a credit to these great English-speaking peoples on both sides of the Atlantic Ocean, who control so immensely the destinies of commerce and all other destinies of the inhabitants of this earth, that we should have been all this long time, more than a hundred years since our independence, without a treaty of commerce to regulate our relations with that part of the British possessions which lies next to us and upon this continent. But so it is, so it has been, and so it is likely to remain.

"The Senator from Kansas was anxious to know whether the committee proposed to go to war. About what should we go to war? Not certainly on account of the breach of any commercial treaty with Great Britain in respect of the Canadian provinces, for we have not got any. It would be a war of words, necessarily followed by a war of acts of a commercial character simply, if we should have a war, for there is to be no broken engagements brought to the attention of any government in consequence of the conduct either of Great Britain or of our Government upon these questions, unless it may be that some rights which have been guaranteed to our fishermen in the Treaty of 1818, not commercial rights, but fishery rights, shall have been violated by the Canadian Government or by ourselves.

"The Treaty of 1818 is the real point of dispute between us—the construction of it, the question of its proper enforcement, and the question of the responsibility of the British Government for the acts of the Dominion in regard to that treaty. That is the real bone of controversy between us to-day, and it is about that which we differ. We are undertaking to improve our condition in respect of our differences on that subject, and other commercial questions between us and Great Britain or the Canadian provinces, by the reformation of our statutes, so as to give to our own Government by the authority of Congress under the sanctions of law that degree of power which is necessary to enable our Government to protect itself and to protect its people against aggressive acts on the part of the Canadian provinces or the Government of Great Britain, as you please. That is all of it."

February 23, the measure was reported to the House from the Committee on Foreign Affairs, with an amendment by way of substitute, the main point of which was that it provided for retaliation by stopping intercourse with Canada by land as well as by sea. This substitute was adopted by the House by the following vote:

YEAS—J. J. Adams, J. M. Allen, Ballentine, Barbour, Barkdale, Barnes, Barry, Belmont, Bennett, Blanchard, Bland, Bliss, Blount, Boyle, Bragg, C. E. Breckinridge, W. C. P. Breckinridge, Bynum, Cabell, J. M. Campbell, J. E. Campbell, Carleton, Catchings, Clements, Cobb, Compton, Comstock, Cowles, W. B. Cox, Crain, Crisp, Culberson, Daniel, Dargan, A. C. Davidson, R. H. M. Davidson, Dawson, Dibble, Dockery, Dougherty, Dunn, Eden, Emmentrout, Findlay, Fisher, Foran, Forney, Gay, Geddes, C. H. Gibson, Glass, Green, Hall, Halsell, Hammond, Harris, Hatch, Heard, Hemphill, J. S. Henderson, Herbert, Hill, Holman, Howard, Hudd, Hutton, Irion, T. D. Johnston, J. H. Jones, J. T. Jones, King, Kleiner, Laffoon, Landes, Lanham, Lawler, Le Fevre, Lovering, Martin, Matson Maybury, McCreary, McMillin, McRae, Merriman, Miller, Mills, Mitchell, Morgan, Morrison, Muller, Murphy, Neal, Neece, Norwood, Oates, O'Ferral, J. J. O'Neill, Outhwaite, Peel, Perry, Randall, Reagan, Richardson, Riggs, Robertson, Rogers, Rusk, Sayers, Scott, Seymour, Shaw, Singleton, Snyder, Sowden, Spriggs, Springer, Stahlnecker, Storm, Swope, Tarsney, Taulbee, J. M. Taylor, Tillman, Townshend, Tucker, Turner, Van Eaton, T. B. Ward, A. J. Warner, William Warner, J. B. Weaver, Wilkins, Willia, Wilson, Wise, Worthington—187.

NAYS—G. E. Adams, C. H. Allen, J. A. Anderson, Atkinson, Baker, Bayne, Bound, Brady, C. E. Brown, W. W. Brown, Brumm, Buck, Bunnell, Burleigh, Burrows, Butterworth, Cannon, Caswell, Conger, Cutcheon, Davis, Dingley, Dorsey, Dunham, Ely, Evans, Everhart, Farquhar, Felton, Fleezer, Ford, Frederick, Fuller, Funston, Gallinger, Giddilan, Goff, Grout, Guenther, Hale, Hanback, Harmer, Hayden, Haynes, D. B. Henderson, T. J. Henderson, Hepburn, Hermann, Hiestand, Hires, Hiscok, Hitt, Holmes, Hopkins, Houk, Jackson, James, F. A. Johnson, J. T. Johnston, Kelley, Ketcham, La Follette, Laird, Lehlbach, Libbey, Lindale, Little, Long, Louttit, Lyman, Markham, McComas, McKenna, McKinley, Millard, Moffatt, Morrill, Morrow, Negley, Nelson, O'Donnell, O'Hara, Charles O'Neill, Osborne, Owen, Parker, Payne, Perkins, Peters, Plumb, Price, Rice, Rockwell, Romeis, Rowell, Ryan, Sawyer, Scranton, Scissions, Skinner, Smalls, Spooner, Steele, Stephenson, J.

W. Stewart, Strait, Struble, Swinburne, Symes, E. B. Taylor, I. H. Taylor, Zachary Taylor, J. R. Thomas, O. B. Thomas, Thompson, Wadsworth, Wait, Wakefield, A. J. Weaver, Weber, West, A. C. White, Milo White, Whiting—124.

NOT VOTING—Aiken, C. M. Anderson, Bacon, Bingham, Boutelle, T. M. Browne, Buchanan, Burnes, Caldwell, Felix Campbell, T. J. Campbell, Candler, Clardy, Collins, Cooper, S. S. Cox, Croxton, Curtin, Davenport, Eldredge, Ellsberry, Eustace Gibson, Glover, Grosvenor, Henley, Lore Lowry, Mahoney, McAdoo, Milliken, Payson, Pettibone, Phelps, Pidcock, Pindar, Ranney, Reed, Reese, Sadler, Seney, Charles Stewart, St. Martin, E. F. Stone, W. J. Stone of Kentucky, W. J. Stone of Missouri, Throckmorton, Trigg, Viele, Van Schaick, Wade, Wallace, J. H. Ward, Wellborn, Wheeler, Winans, Wolford, Woodburn—57.

The measure was then passed by a vote of 256 yeas to one nay, Mr. Dougherty, of Florida, voting in the negative. The Senate non-concurred in the House amendment, and a conference committee was appointed which failed to come to an agreement. March 2, the subject came up in the House, and there was a hot debate as to whether that body should recede from its amendment and accede to the limited non-intercourse for which the Senate bill provided. It was determined by the following vote to yield the point:

YEAS—G. E. Adams, C. H. Allen, C. M. Anderson, J. A. Anderson, Atkinson, Baker, Barksdale, Bayne, Bingham, Bound, Boutelle, T. M. Browne, C. E. Brown, W. W. Brown, Brumm, Buchanan, Buck, Bunnell, Burleigh, Burrows, Butterworth, J. M. Mr. Dougherty, of Florida, in the course of the debate on the subject, deprecated all such legislation. He said:

"Mr. Speaker, upon this question no man can say what action this House will take, but in a few moments the position of the majority will be defined, because they must decide one way or the other. As far as I am concerned as an individual Representative, this matter is now just where I hope it will stop. I hope that this House will not recede, and I hope that the Senate will insist, and that this proposed legislation will die, where many a piece of legislation has died, in a committee of conference.

"During this whole discussion it has not been discovered that any American citizen has been deprived of any of his rights, because investigation will show, so far as I am advised, that each and every vessel that has been molested in Canadian waters has been taken up in pursuance of a law which is not in derogation of any treaty existing between the two Governments. It has not been claimed anywhere that there has been any violation of the existing treaty on the part of the English Government, and the laws of Canada, of which we complain, are in consonance with existing treaty, and when Americans violate them they do so at their own peril. No gentleman has claimed that such is not the case, and the difficulty with which we are brought face to face here is the difficulty which has come to us wherever we have had what is called diplomatic negotiation. Except, perhaps, in the instance when a treaty was negotiated with France during the Revolution, men have been appointed to represent this Government who have yielded everything that the representatives of the opposing government asked, and obtained nothing for us. Mr. Speaker, we are too fast in this matter. This pending bill, if it be carried out, if its provisions be put in force, is a virtual declaration of war against the British Government, a friendly power. I take no stock in this spread-eagle, bloody, and patriotic war-talk. The people of this country have had war enough, they do not want any more without good reason. I rely upon the good sense of the American people, and upon the good sense of the English people, to adjust all difficulties; and,

as I have said, I take no stock in this patriotic war-talk. I yield to no man in my devotion to this country. Whenever I am called upon I am ready to take my stand for the maintenance of the sovereignty of the Government of the United States, and for the protection of our citizens in all their rights against every enemy, foreign or domestic. But what is the question presented here? It is a proposition for retaliatory legislation, although it has not been even charged—much less successfully maintained—that there has been any violation on the part of the British Government of any stipulation in any existing treaty; in fact, it is admitted that the opposite is the truth. Vessels not violating law have not been molested, and being seized and the law complied with they have been released.

"The true way to settle this question is through the diplomatic departments of the two Governments; or, failing a settlement there, let us have a new treaty, taking care to appoint as our representatives men who will have sense enough not to yield to the commissioners of the British Government all they may demand, and get no advantageous concessions in return. There is no necessity for this haste, and no danger of any war; it is merely a matter of business, and such legislation is simply an effort to bring about by legislation a remedy for difficulties which exist by virtue of the incompetence of what are called diplomats."

The President approved the bill March 8, 1887.

Pensioners.—Jan. 10, 1887, there was reported from the House Committee on Invalid Pensions a bill for "the relief of dependent parents and honorably discharged soldiers and sailors who are now disabled and dependent on their labor for support." January 17, Mr. Matson, of Indiana, moved that the rules be suspended, and the measure passed. In support of the bill he said: "The first section provides simply that the rule of evidence in claims filed by dependent parents shall be changed so that hereafter those who make such claims shall be required to prove only a present dependence, instead of a dependence existing at the time of the death of the soldier. This section of the bill is an exact copy of one section of a bill passed under a suspension of the rules, on motion of the distinguished gentleman from Ohio (Mr. Warner), on the 21st day of April, 1884. That bill, in that form, passed the House and went to the Senate. It is in precise accord with the recommendations of the Secretary of the Interior, as contained in his last annual report, to be found on page 50 of that report.

"As to the second proposition, the more important one, I desire to call the attention of the House, in the first place, to the fact that this provision embraces honorably discharged soldiers of all the wars in which the United States has been engaged; it embraces those engaged in the Seminole, in the Black Hawk,

in the Mexican, and in the last war. It is a broad measure, and not confined to the soldiers of any particular war. The gist of the proposition, Mr. Speaker, is to take from the poor-houses of the country the soldiers who have honorably served their country during any war. The proposition contained in this section of the bill is simply that every man who is totally unable to labor, and is in a dependent condition, shall be pensioned at the rate of \$12 per month. There is no provision for pensioning any one who has a less disability than a total inability to labor; and in addition to that he must show that he is dependent upon his daily labor for his support, and has no property from which to derive an income. It is a charity measure.

"It will not be asserted by the friends or enemies of the bill, I apprehend, that there is anything in any contract made by the Government that would call for this legislation; but the legislation itself is the outgrowth of a sentiment that I believe prevails, throughout the length and breadth of this country, against permitting the men who have defended the Government to remain in the poor-houses to be supported by charity; and it is in obedience to that sentiment that the committee deem it proper to bring in a measure placing these men upon the honorable roll of pensioners of the United States.

"Now, as to the matter of cost: I desire to say that early in this Congress, in obedience to a suggestion made to the Commissioner of Pensions, when he was before the Committee on Invalid Pensions, and was being examined in connection with various matters relating to the pension laws, he wrote to the authorities in every county in the United States for the purpose of ascertaining how many soldiers and sailors who had been in the United States service were then objects of public or private charity throughout the land. He learned from 1,240 of the 2,583 counties in the United States that in the 1,240 counties there are 5,172 cases of soldiers and sailors who are now being supported in the public institutions of charity. So that it is estimated, inasmuch as these reports came in about equal proportions from all sections of the country, that there are an equal number in the remaining counties, not quite one half having been heard from, and so on that basis it is assumed that there are now in the United States a total of 10,344 persons dependent upon organized charities in the several States and Territories who would become pensioners under this bill.

"The report affords no exact information as to the inmates of soldiers' homes, both State and national, who may be entitled to the benefits of the bill, but we are clearly of opinion, from the best information obtainable, that the number will not exceed 3,000.

"The committee did not stop there. In addition to that, there has been added an estimate as to those who are not supported by public charity, but who are the recipients of private

relief—the recipients of charity from those who are not legally bound for their support—and there has been added, because of that class, an average of five to each county, giving a total of 12,905 in all. That added to the other number makes a total of 26,249 probable pensioners in the event of the passage of this bill. That is the estimate of the committee. Then, in addition to that, the committee considered the further fact that there were pending in the Pension-Office claims of those who perhaps could bring themselves within the provisions of this bill, who were now receiving a small pension, and they added on that account a considerable number, 6,856 persons in all. So that the grand total of those who are to be benefited by the passage of this bill is estimated by the committee, from the best available sources, to be 33,105 persons at an annual expense of \$144 each, or a total aggregate of \$4,767,120 per annum.

"This estimate, Mr. Speaker, which I have given to the House, is based upon the number of soldiers in the last war. Now, in addition to that, the other soldiers of other wars must be taken into account. It will be liberal, I think, to say that not more than 10 per cent. would be added to it, and even if 15 per cent. more would be added under this section, it would still require less than six million dollars per annum to pay the expenses of all the pensions provided for in the bill.

"This, then, Mr. Speaker, is not only a broad and philanthropic measure, but it is a reasonable and conservative proposition. It is not wild and is not extravagant. It is in the line of action suggested by the Chief Executive in his last annual message."

In criticism of the measure Mr. Warner, of Ohio, said:

"While I may not vote against this bill, there are some features of it which I deem very objectionable, and I hope that at least in one particular an amendment will be allowed.

"There is no subject, Mr. Speaker, upon which Congress is called to legislate where it is more important to adhere to sound and consistent principles than in legislating upon the subject of pensions; and yet there is no subject on which we are so likely to be carried away by sentiment, by emotion, and, if I may say so, by demagoguery, as on the question of pensions.

"The first section of this bill I heartily approve. I think it entirely sound in principle. There is every reason to suppose that a soldier who was killed in the war if he were living would extend aid now to his aged parents if in need. The question should not therefore be were they in need at the time of the soldier's death, but are they in need now? This bill differs very widely in principle, too, from the bill passed at the last session of Congress which I voted against, and if I ever cast a righteous vote I think that was one; I allude to the bill increasing the pensions of that small class who

were already receiving very large pensions. That bill to the few who had much gave more, and to those who had nothing it gave nothing.

"But, Mr. Speaker, the principal objection which I have to this bill is to the pauper feature of the second section. Indeed, the bill is made by this section rather a pauper bill than a pension bill. I do not like that feature of it. In 1818 a bill was passed not unlike this relating to the soldiers of the Revolutionary War; it was a bill granting pensions to those who were indigent or paupers, but it did not stand long. It was modified the next year, I believe, so as to include all who had not property of the value of \$300. It never gave satisfaction, and led to frequent amendments, and finally was repealed entirely. The principle of this act was frequently condemned in the debates in Congress."

The rules were suspended, and the bill passed by the following vote:

YEAS—G. E. Adams, J. J. Adams, C. H. Allen, C. M. Anderson, J. A. Anderson, Atkinson, Bacon, Baker, Bayne, Bound, Boutelle, Boyle, Brady, C. E. Brown, W. W. The full text of the bill was as follows:

Be it enacted, etc., That in considering the pension claims of dependent parents, the fact and cause of death, and the fact that the soldier left no widow or minor children, having been shown as required by law, it shall be necessary only to show by competent and sufficient evidence that such parent or parents are without other present means of support than their own manual labor or the contributions of others not legally bound for their support: *Provided*, That no pension allowed under this act shall commence prior to its passage, and in case of applications hereafter made under this act the pension shall commence from the date of the filing of the application in the Pension-Office.

SEC. 2. That all persons who served three months or more in the military or naval service of the United States in any war in which the United States has been engaged, and who have been honorably discharged therefrom, and who are now or who may hereafter be suffering from mental or physical disability, not the result of their own vicious habits or gross carelessness, which incapacitates them for the performance of labor in such a degree as to render them unable to earn a support, and who are dependent upon their daily labor for support, shall, upon making due proof of the fact according to such rules and regulations as the Secretary of the Interior may provide in pursuance of this act, be placed on the list of invalid pensioners of the United States, and be entitled to receive, for such total inability to procure their subsistence by daily labor, \$12 per month; and such pension shall commence from the date of the filing of the application in the Pension-Office, upon proof that the disability then existed, and continued during the existence of the same in the degree herein provided: *Provided*, That persons who are now receiving pensions under existing laws, or whose claims are pending in the Pension-Office, may, by application to the Commissioner of Pensions, in such forms as he may prescribe, receive the benefits of this act; but nothing herein contained shall be so construed as to allow more than one pension at the same time to the same person or pension to commence prior to the passage of this act: *And provided further*, That rank in the service shall not be considered in applications filed thereunder.

SEC. 3. That no agent, attorney, or other person instrumental in the presentation and prosecution of a claim under this act shall demand or receive for his services or instrumentality in presenting and prosecuting such claim a sum greater than \$5, payable only upon the order of the Commissioner of Pensions, by the pension agent making payment of the pension allowed, except in cases heretofore prosecuted before the Pension-Office, when, in the discretion of the Commissioner of Pensions, a fee of \$10 may be allowed in like manner to the agent or attorney of record in the case at the date of the passage of this act; and any agent, attorney, or other person instrumental in the prosecution of a claim under this act who shall demand or receive a sum greater than that herein provided for, for his services in the prosecution of the claim, shall be subject to the same penalties as prescribed in section 4 of the act of July 4, 1864, entitled "An act making appropriations for the payment of invalid and other pensions of the United States for the fiscal year ending June 30, 1865, and for other purposes."

SEC. 4. That section 4716 of the Revised Statutes is hereby modified so that the same shall not apply to this act: *Provided*, That this act shall not apply to those persons under political disabilities. And no person shall be pensioned under this act for any disability incurred while engaged in the military service against the United States.

This measure differed from that passed by the Senate at the previous session of Congress in not limiting its provisions to soldiers who had served in the civil war. It came up for discussion in the Senate January 27, and passed that body without a division.

Feb. 11, 1887, the President sent in the following veto message:

To the House of Representatives:

I herewith return without my approval House bill 10,457, entitled "An act for the relief of dependent parents and honorably discharged soldiers and sailors who are now disabled and dependent upon their own labor for support."

This is the first general bill that has been sanctioned by the Congress since the close of the late civil war, permitting a pension to the soldiers and sailors who served in that war upon the ground of service and present disability alone, and in the entire absence of any injuries received by the casualties or incidents of such service.

While by almost constant legislation since the close of this war, there has been compensation awarded for every possible injury received as a result of military service in the Union Army, and while a great number of laws passed for that purpose have been administered with great liberality, and have been supplemented by numerous private acts to reach special cases, there has not, until now, been an avowed departure from the principle thus far adhered to respecting Union soldiers, that the bounty of the Government in the way of pensions is generously bestowed when granted to those who in this military service, and in the line of military duty have, to a greater or less extent, been disabled.

But it is a mistake to suppose that service pensions such as are permitted by the second section of the bill under consideration, are new to our legislation. In 1818, thirty-five years after the close of the Revolutionary War, they were granted to the soldiers engaged in that struggle, conditional upon service until the end of the war, or for a term not less than nine months, and requiring every beneficiary under the act to be one "who is, or hereafter by reason of his reduced circumstances in life shall be, in need of assistance from his country for support." Another law of a like character was passed in 1823, requiring service until the close of the Revolutionary War; and still another, passed in 1832, provided for those persons not included in the previous statute, but who served two years at some time during the war, and giving a proportionate sum to those who had served not less than six months.

A service pension law was passed for the benefit of the soldiers of 1812, in the year 1871—fifty-six years after the close of that war—which required only sixty days' service; and another was passed in 1878—sixty-three years after the war—requiring only fourteen days' service.

The service pension bill passed at this session of Congress, thirty-nine years after the close of the Mexican War, for the benefit of the soldiers of that war, requires either some degree of disability or dependency, or that the claimant under its provisions should be sixty-two years of age; and in either case that he should have served sixty days or been actually engaged in a battle.

It will be seen that the bill of 1818, and the Mexican pension bill being thus passed nearer the close of the wars in which its beneficiaries were engaged than the others—one thirty-five years and the other thirty-

nine years after the termination of such wars—embraced persons who were quite advanced in age, assumed to be comparatively few in number, and whose circumstances, dependence, and disabilities were clearly defined, and could be quite easily fixed.

The other laws referred to, appear to have been passed at a time so remote from the military service of the persons which they embraced, that their extreme age alone was deemed to supply a presumption of dependency and need.

The number of enlistments in the Revolutionary War is stated to be 809,791, and in the War of 1812, 576,622; but it is estimated that on account of repeated re-enlistments the number of individuals engaged in these wars did not exceed one half of the number represented by these figures. In the war with Mexico, the number of enlistments is reported to be 112,280, which represents a greater proportion of individuals engaged than the reported enlistments in the two previous wars.

The number of pensions granted under all laws to soldiers of the Revolution, is given at 82,069; to soldiers of the War of 1812 and their widows, 60,178; and to soldiers of the Mexican War and their widows up to June 30, 1885, 7,619. The latter pensions were granted to the soldiers of a war involving much hardship, for disabilities incurred as a result of such service; and it was not till within the last month that the few remaining survivors were awarded a service pension.

The War of the Rebellion terminated nearly twenty-two years ago; the number of men furnished for its prosecution is stated to be 2,772,408. No corresponding number of statutes have ever been passed to cover every kind of injury or disability incurred in the military service of any war. Under these statutes, 561,576 pensions have been granted from the year 1861 to June 30, 1886, and more than 2,600 pensioners have been added to the rolls by private acts passed to meet cases, many of them of questionable merit, which the general laws did not cover.

On the 1st day of July, 1886, 365,763 pensioners of all classes were upon the pension-rolls, of whom, 305,605 were survivors of the war of the rebellion, and their widows and dependents. For the year ending June 30, 1887, \$75,000,000 have been appropriated for the payment of pensions, and the amount expended for that purpose from 1861 to July 1, 1886, is \$808,624,811.51.

While annually paying out such a vast sum for pensions already granted, it is now proposed, by the bill under consideration, to award a service pension to the soldiers of all wars in which the United States has been engaged, including, of course, the War of the Rebellion, and to pay those entitled to the benefits of the act the sum of \$12 per month.

So far as it relates to the soldiers of the late Civil War, the bounty it affords them is given thirteen years earlier than it has been furnished to the soldiers of any other war, and before a large majority of its beneficiaries have advanced in age beyond the strength and vigor of the prime of life.

It exacts only a military or naval service of three months without any requirement of actual engagement with an enemy in battle, and without a subjection to any of the actual dangers of war.

The pension it awards is allowed to enlisted men who have not suffered the least injury, disability, loss, or damage of any kind, incurred in or in any degree referable to their military service, including those who never reached the front at all, and those discharged from rendezvous at the close of the war, if discharged three months after enlistment. Under the last call of the President for troops in December, 1864, 11,308 men were furnished who were thus discharged.

The section allowing this pension does, however, require, besides a service of three months and an honorable discharge, that those seeking the benefit of the act shall be such as "are now or may hereafter be suffering from mental or physical disability, not the

result of their own vicious habits or gross carelessness, which incapacitates them for the performance of labor in such a degree as to render them unable to earn a support, and who are dependent upon their daily labor for support."

It provides further that such persons shall, upon making proof of the fact, "be placed on the list of invalid pensioners of the United States, and be entitled to receive for such total inability to procure their subsistence by daily labor, twelve dollars per month; and such pension shall commence from the date of the filing of the application in the Pension-Office, upon proof that the disability then existed, and continue during the existence of the same in the degree herein provided: *Provided*, That persons who are now receiving pensions under existing laws, or whose claims are pending in the Pension-Office, may, by application to the Commissioner of Pensions, in such form as he may prescribe, receive the benefit of this act."

It is manifestly of the utmost importance that statutes which like pension laws should be liberally administered as measures of benevolence in behalf of worthy beneficiaries, should admit of no uncertainty as to their general objects and consequences.

Upon a careful consideration of the language of the section of this bill above given, it seems to me to be so uncertain and liable to such conflicting constructions, and to be subject to such unjust and mischievous application, as to alone furnish sufficient ground for disapproving the proposed legislation.

Persons seeking to obtain the pension provided by this section must be now or hereafter—

1. "Suffering from mental or physical disability."
2. Such disability must not be "the result of their own vicious habits or gross carelessness."
3. Such disability must be such as "incapacitates them for the performance of labor in such a degree as to render them unable to earn a support."
4. They must be "dependent upon their daily labor for support."

5. Upon proof of these conditions they shall "be placed on the lists of invalid pensioners of the United States, and be entitled to receive for such total inability to procure their subsistence by daily labor twelve dollars per month."

It is not probable that the words last quoted, "such total inability to procure their subsistence by daily labor," at all qualify the conditions prescribed in the preceding language of the section. The "total inability" spoken of must be "such" inability—that is, the inability already described and constituted by the conditions already detailed in the previous parts of the section.

It thus becomes important to consider the meaning and the scope of these last-mentioned conditions.

The mental and physical disability spoken of has a distinct meaning in the practice of the Pension Bureau, and includes every impairment of bodily or mental strength and vigor. For such disabilities there are now paid one hundred and thirty-one different rates of pension, ranging from \$1 to \$100 per month.

The disability must not be the result of the applicant's "vicious habits or gross carelessness." Practically this provision is not important. The attempt of the Government to escape the payment of a pension on such a plea, would of course, in a very large majority of instances, and regardless of the merits of the case, prove a failure. There would be that strange but nearly universal willingness to help the individual as between him and the public treasury, which goes very far to insure a state of proof in favor of the claimant.

The disability of applicants must be such as to "incapacitate them for the performance of labor in such a degree as to render them unable to earn a support."

It will be observed that there is no limitation or defluition of the incapacitating injury or ailment itself. It need only be such a degree of disability from any cause as renders the claimant unable to earn a

support by labor. It seems to me that the "support" here mentioned as one which can not be earned, is a complete and entire support, with no diminution on account of the least impairment of physical or mental condition. If it had been intended to embrace only those who by disease or injury were totally unable to labor, it would have been very easy to express that idea, instead of recognizing as is done a "degree" of such inability.

What is a support? Who is to determine whether a man earns it or has it or has it not? Is the Government to enter the homes of claimants for pension, and after an examination of their surroundings and circumstances settle those questions? Shall the Government say to one man that his manner of subsistence by his earnings is a support, and to another that the things his earnings furnish are not a support? Any attempt, however honest, to administer this law in such a manner would necessarily produce more unfairness and unjust discrimination and give more scope for partisan partiality, and would result in more perversion of the Government's benevolent intentions, than the execution of any statute ought to permit.

If in the effort to carry out the proposed law, the degree of disability as related to earnings, be considered for the purpose of discovering if in any way it curtails the support which the applicant if entirely sound would earn, and to which he is entitled, we enter the broad field long occupied by the Pension Bureau, and we recognize as the only difference between the proposed legislation and previous laws passed for the benefit of the surviving soldiers of the civil war, the incurrance in one case of disabilities in military service, and in the other disabilities existing but in no way connected with or resulting from such service.

It must be borne in mind that in no case is there any grading of this proposed pension. Under the operation of the rule first suggested, if there is a lack in any degree, great or small, of the ability to earn such a support as the Government determines the claimant should have, and by the application of the rule secondly suggested, if there is a reduction in any degree of the support which he might earn if sound, he is entitled to a pension of \$12.

In the latter case, and under the proviso of the proposed bill, permitting persons now receiving pensions to be admitted to the benefits of the act, I do not see how those now on the pension-roll for disabilities incurred in the service, and which diminish their earning capacity, can be denied the pension provided in this bill.

Of course none will apply who are now receiving \$12 or more per month. But on the 30th day of June, 1886, there were on the pension-rolls 202,621 persons who were receiving fifty-eight different rates of pension from \$1 to \$11.75 per month. Of these, 23,143 were receiving \$2 per month; 63,118, \$4 per month; 37,354, \$6 per month; and 50,274, whose disabilities were rated as total, \$8 per month.

As to the meaning of the section of the bill under consideration there appears to have been quite a difference of opinion among its advocates in the Congress. The chairman of the Committee on Pensions in the House of Representatives, who reported the bill, declared that there was in it no provision for pensioning any one who has a less disability than a total inability to labor, and that it was a charity measure. The chairman of the Committee on Pensions in the Senate, having charge of the bill in that body, dissented from the construction of the bill announced in the House of Representatives, and declared that it not only embraced all soldiers totally disabled, but in his judgment all who are disabled to any considerable extent; and such a construction was substantially given to the bill by another distinguished Senator who, as a former Secretary of the Interior, had imposed upon him the duty of executing pension laws and determining their intent and meaning.

Another condition required of claimants under this act is that they shall be "dependent upon their daily labor for support."

This language, which may be said to assume that there exists within the reach of the persons mentioned "labor," or the ability in some degree to work, is more aptly used in a statute describing those not wholly deprived of this ability, than in one which deals with those utterly unable to work.

I am of the opinion that it may fairly be contended that under the provisions of this section any soldier, whose faculties of mind or body have become impaired by accident, disease, or age, irrespective of his service in the army as a cause, and who by his labor only is left incapable of gaining the fair support he might with unimpaired powers have provided for himself, and who is not so well endowed with this world's goods as to live without work, may claim to participate in its bounty; that it is not required that he should be without property, but only that labor should be necessary to his support in some degree; nor is it required that he should be now receiving support from others.

Believing this to be the proper interpretation of the bill, I can not but remember that the soldiers of our civil war, in their pay and bounty, received such compensation for military service as has never been received by soldiers before, since mankind first went to war; that never before, on behalf of any soldiery, have so many and such generous laws been passed to relieve against the incidents of war; that statutes have been passed giving them a preference in all public employments; that the really needy and homeless Union soldiers of the rebellion have been, to a large extent, provided for at soldiers' homes, instituted and supported by the Government, where they are maintained together, free from the sense of degradation which attaches to the usual support of charity; and that never before in the history of the country has it been proposed to render Government aid toward the support of any of its soldiers based alone upon a military service so recent, and where age and circumstances appeared so little to demand such aid.

Hitherto such relief has been granted to surviving soldiers few in number, venerable in age, after a long lapse of time since their military service, and as a parting benefaction tendered by a grateful people.

I can not believe that the vast peaceful army of Union soldiers, who have contentedly resumed their places in the ordinary avocations of life cherish as sacred the memory of patriotic service, or, who having been disabled by the casualties of war justly regard the present pension-roll, on which appear their names, as a roll of honor, desire at this time and in the present exigency, to be confounded with those who through such a bill as this are willing to be objects of simple charity and to gain a place upon the pension-roll through alleged dependence.

Recent personal observation and experience constrain me to refer to another result which will inevitably follow the passage of this bill. It is sad but nevertheless true that already in the matter of procuring pensions there exists a wide-spread disregard of truth and good faith, stimulated by those who as agents undertake to establish claims for pensions, heedlessly entered upon by the expectant beneficiary, and encouraged or at least not condemned by those unwilling to obstruct a neighbor's plans.

In the execution of this proposed law under any interpretation, a wide field of inquiry would be opened for the establishment of facts largely within the knowledge of the claimants alone; and there can be no doubt that the race after the pensions offered by this bill would not only stimulate weakness and pretended incapacity for labor, but put a further premium on dishonesty and mendacity.

The effect of new invitations to apply for pensions, or of new advantages added to causes for pensions already existing, is sometimes startling.

Thus in March, 1879, large arrearages of pensions

were allowed to be added to all claims filed prior to July 1, 1880. For the year from July 1, 1879, to July 1, 1880, there were filed 110,678 claims, though in the year immediately previous there were but 86,832 filed, and in the year following but 18,455.

While cost should not be set against a patriotic duty or the recognition of a right, still, when a measure proposed is based upon generosity or motives of charity, it is not amiss to meditate somewhat upon the expense which it involves. Experience has demonstrated, I believe, that all estimates concerning the probable future cost of a pension-list are uncertain and unreliable, and always fall far below actual realization.

The chairman of the House Committee on Pensions calculates that the number of pensioners under this bill would be 83,105, and the increased cost \$4,767,120; this is upon the theory that only those who are entirely unable to work would be its beneficiaries. Such was the principle of the Revolutionary pension law of 1818, much more clearly stated, it seems to me, than in this bill. When the law of 1818 was upon its passage in Congress the number of pensioners to be benefited thereby was thought to be 874; but the number of applicants under the act was 22,297, and the number of pensions actually allowed 20,485, costing, it is reported, for the first year, \$1,847,900, instead of \$40,000, the estimated expense for that period.

A law was passed in 1853 for the benefit of the surviving widows of Revolutionary soldiers who were married after Jan. 1, 1800. It was estimated that they numbered 800 at the time of the passage of the act; but the number of pensions allowed was 8,742, and the amount paid for such pensions during the first year of the operation of the act was \$180,000, instead of \$24,000 as had been estimated.

I have made no search for other illustrations, and the above being at hand, are given as tending to show that estimates can not be relied upon in such cases.

If none should be pensioned under this bill except those utterly unable to work, I am satisfied that the cost stated in the estimate referred to would be many times multiplied, and with a constant increase from year to year; and if those partially unable to earn their support should be admitted to the privileges of this bill, the probable increase of expense would be almost appalling.

I think it may be said that at the close of the War of the Rebellion every Northern State and a great majority of Northern counties and cities, were burdened with taxation on account of the large bounties paid our soldiers; and the bonded debt thereby created still constitutes a large item in the account of the tax-gatherer against the people. Federal taxation, no less borne by the people than that directly levied upon their property, is still maintained at the rate made necessary by the exigencies of war. If this bill should become a law, with its tremendous addition to our pension obligation, I am thoroughly convinced that further efforts to reduce the Federal revenue and restore some part of it to our people, will and perhaps should be seriously questioned.

It has constantly been a cause of pride and congratulation to the American citizen that his country is not put to the charge of maintaining a large standing army in time of peace. Yet we are now living under a war-tax which has been tolerated in peaceful times to meet the obligations incurred in war. But for years past, in all parts of the country, the demand for the reduction of the burdens of taxation upon our labor and production has increased in volume and urgency.

I am not willing to approve a measure presenting the objections to which this bill is subject, and which, moreover, will have the effect of disappointing the expectation of the people and their desire and hope for relief from war-taxation in time of peace.

In my last annual message the following language was used:

"Every patriotic heart responds to a tender consideration for those who, having served their country long and well, are reduced to destitution and dependence, not as an incident of their service, but with advancing age or through sickness or misfortune. We are all tempted by the contemplation of such a condition to supply relief, and are often impatient of the limitations of public duty. Yielding to no one in the desire to indulge this feeling of consideration, I can not rid myself of the conviction that if these ex-soldiers are to be relieved, they and their cause are entitled to the benefit of an enactment under which relief may be claimed as a right, and that such relief should be granted under the sanction of law, not in evasion of it; nor should such worthy objects of care, all equally entitled, be remitted to the unequal operation of sympathy, or the tender mercies of social and political influence with their unjust discriminations."

I do not think that the objects, the conditions, and the limitations thus suggested, are contained in the bill under consideration.

I adhere to the sentiments thus heretofore expressed. But the evil threatened by this bill is, in my opinion, such that, charged with a great responsibility in behalf of the people, I can not do otherwise than to bring to the consideration of this measure my best efforts of thought and judgment, and perform my constitutional duty in relation thereto, regardless of all consequences, except such as appear to me to be related to the best and highest interests of the country.

GROVER CLEVELAND.

EXECUTIVE MANSION,

Washington, Feb. 11, 1887.

February 24, the motion to reconsider and pass the bill came up for discussion in the House, and, after a long and heated debate, it failed, by the following vote—lacking the constitutional majority of two thirds requisite for overriding a veto:

YEAS—G. E. Adams, C. H. Allen, J. A. Anderson, Atkinson, Baker, Bayne, Bingham, Bliss, Bound, Bou-telle, Brady, T. M. Browne, C. E. Brown, W. W. Brown, Brumm, Buck, Bunnell, Burleigh, Burrows, Butterworth, Bynum, J. M. Campbell, J. E. Campbell, Cannon, Carleton, Caswell, Conger, Cooper, Cutchson, Davenport, Davis, Dingley, Dorsey, Dunham, Eldredge, Ely, Evans, Everhart, Farquhar, Felton, Flee-ger, Ford, Frederick, Fuller, Funston, Gallinger, Ged-des, Gilfillan, Goff, Grosvenor, Grout, Guenther, Hale, Hanback, Harmer, Hayden, Haynes, D. B. Hender-son, T. J. Henderson, Hepburn, Hermann, Hiestand, Hires, Hiseock, Hitt, Holman, Holmes, Hopkins, Houk, Howard, Jackson, James, F. A. Johnson, J. T. Johnston, Kelley, Ketcham, Kleiner, La Follette, Laird, Landes, Lawler, Le Fevre, Lehibach, Libbey, Lindsley Little, Long, Lore, Louttit, Lovering, Ly-man, Mahoney, Markham, Matson, Maybury, Mc-Comas, McKenna, McKinley, Merriman, Millard, Milliken, Moffatt, Morrill, Morrow, Murphy, Neece, Negley, Nelson, O'Donnell, O'Hara, Charles O'Neill, J. J. O'Neill, Osborne, Owen, Parker, Payne, Pay-son, Perkins, Peters, Pettibone, Phelps, Pindar, Pince, Plumb, Randall, Ranney, Rice, Riggs, Rock-well, Romeis, Rowell, Ryan, Sawyer, Scranton, Se-ney, Sessions, Smalls, Spooner, Spriggs, Steele, Ste-phenson, J. W. Stewart, E. F. Stone, Strait, Struble, Swinburne, Swope, Symes, Tarsney, Taubee, E. B. Taylor, I. H. Taylor, Zachary Taylor, J. R. Thomas, O. B. Thomas, Thompson, Townshend, Van Schaick, Wade, Wadsworth, Wait, Wakefield, J. H. Ward, William Warner, A. J. Weaver, J. B. Weaver, We-ber, West, A. C. White, Milo White, Whiting, Wil-kins, Wolford, Woodburn, Worthington—175.

NAYS—J. J. Adams, J. M. Allen, Bacon, Ballen-tine, Barbour, Barksdale, Barnes, Barry, Belmont, Bennett, Blanchard, Bland, Blount, Boyle, Bragg, C. R. Breckinridge, W. C. P. Breckinridge, Burnes, Cabell, Caldwell, Felix Campbell, T. J. Campbell,

Catchings, Clements, Cobb, Collins, Compton, Comstock, Cowles, S. S. Cox, W. R. Cox, Crain, Crisp, Culberson, Curtin, Daniel, Dargan, A. C. Davidson, R. H. M. Davidson, Dawson, Dibble, Dockery, Dougherty, Dunn, Eden, Ermentrout, Findlay, Fisher, Forney, Gay, C. H. Gibson, Eustace Gibson, Glass, Green, Hall, Halsell, Hammond, Harris, Hatch, Heard, Hemphill, J. S. Henderson, Herbert, Hill, Hudd, Hutton, Irion, T. D. Johnston, J. H. Jones, J. T. Jones, King, Laffoon, Lanham, Martin, McAdoo, McCreary, McMillin, McRae, Miller, Mills, Mitchell, Morgan, Morrison, Muller, Neal, Norwood, Oates, O'Ferrall, Outhwaite, Peel, Perry, Reagan, Reese, Richardson, Robertson, Rogers, Sayers, Scott, Seymour, Shaw, Singleton, Skinner, Snyder, Sowden, Springer, Stahlnecker, Charles Stewart, St. Martin, W. J. Stone of Kentucky, W. J. Stone of Missouri, Storm, J. M. Taylor, Tillman, Trigg, Tucker, Turner, Van Eaton, Vile, T. B. Ward, A. J. Warner, Wellborn, Wheeler, Willis, Wilson, Wise—125.

Nor Voters—Aiken, C. M. Anderson, Buchanan, Candler, Clardy, Croxton, Ellsberry, Foran, Glover, Henley, Lowry, Pidcock, Reed, Rusak, Sadler, Throckmorton, Wallace, Winans—18.

Jan. 17, 1887, Mr. Eldridge, of Michigan, from the House Committee on Pensions, reported back the bill granting pensions to soldiers and sailors of the Mexican War, and moved that the rules be suspended and the Senate amendments concurred in. The motion prevailed, by a vote of 247 yeas to 5 nays. The original House bill and the Senate substitute, which the House concurred in, were given in the "Annual Cyclopaedia" for 1886, at page 258. February 1, Congress was notified that the President approved of the measure. Though containing an age limit, it virtually provides for pensioning everybody who served sixty days in the army or navy in the Mexican War, even though the time was passed at a frontier station, or *en route* to the seat of war.

Court of Claims and Circuit Courts.—Jan. 13, 1887, the House passed a bill to provide for the bringing of suits against the Government of the United States. In explanation of the measure, Mr. Tucker, of Virginia, who reported it from the Committee on the Judiciary, said:

"As to this bill I would say that it is one which was very carefully matured by the Committee on the Judiciary nearly a year ago. The committee took all the bills with this general object that had been referred to it, as well as one reported by the Judiciary Committee of the Senate, and from those bills matured this one, which was reported, I think, from the committee with entire unanimity. The object of the bill is this: It extends the jurisdiction of the Court of Claims beyond the mere contract obligations of the Government to obligations of all kinds, as well those that could be asserted in a court of law as those which could be asserted in a court of equity or in admiralty. The bill also gives concurrent jurisdiction to the Circuit Court of the United States in the locality where the claim originates or where the party plaintiff resides, to consider all claims concurrently with the Court of Claims up to the amount of \$10,000. The Court of Claims has jurisdiction with the circuit courts as to all claims, and under this bill the circuit courts

will have concurrent jurisdiction with the Court of Claims in all cases up to the amount of \$10,000.

"The only cases not provided for are suits upon the use of a patent right by the Government and suits in reference to captured and abandoned property which are now barred by the statutes of limitations. This bill extends the jurisdiction of the Court of Claims to all cases which arise, not only *ex contractu* but *ex delicto*, and to cases in admiralty, so that it will take the whole mass of these claims away from Congress."

The Senate amended and passed the measure February 24. The House non-concurred in the Senate amendments, and a conference committee was appointed, which recommended the following measure, to which both Houses agreed on March 3:

Be it enacted, &c., That the Court of Claims shall have jurisdiction to hear and determine the following matters:

First. All claims founded upon the Constitution of the United States or any law of Congress, except for pensions, or upon any regulation of an Executive Department, or upon any contract, expressed or implied, with the Government of the United States, or for damages, liquidated or unliquidated, in cases not sounding in tort, in respect of which claims the party would be entitled to redress against the United States either in a court of law, equity, or admiralty if the United States were suable: *Provided, However*, That nothing in this section shall be construed as giving to either of the courts herein mentioned jurisdiction to hear and determine claims growing out of the late civil war and commonly known as "war claims," or to hear and determine other claims, which have heretofore been rejected, or reported on adversely, by any court, department, or commissioner authorized to hear and determine the same.

Second. All set-offs, counter-claims, claims for damages, whether liquidated or unliquidated, or other demands whatsoever on the part of the Government of the United States against any claimant against the Government in said court: *Provided*, That no suit against the Government of the United States shall be allowed under this act unless the same shall have been brought within six years after the right accrued for which the claim is made.

Sec. 2. That the district courts of the United States shall have concurrent jurisdiction with the Court of Claims as to all matters named in the preceding section where the amount of the claim does not exceed \$1,000, and the circuit courts of the United States shall have such concurrent jurisdiction in all cases where the amount of such claim exceeds \$1,000 and does not exceed \$10,000. All causes brought and tried under the provisions of this act shall be tried by the court without a jury.

Sec. 3. That whenever any person shall present his petition to the Court of Claims, alleging that he is or has been indebted to the United States as an officer or agent thereof, or by virtue of any contract therewith, or that he is the guarantor, or surety, or personal representative of any officer, or agent, or contractor so indebted, or that he, or the person for whom he is such surety, guarantor, or personal representative, has held any office or agency under the United States, or entered into any contract therewith, under which it may be or has been claimed that an indebtedness to the United States has arisen and exists, and that he or the person he represents has applied to the proper department of the Government requesting that the account of such office, agency, or indebtedness may be adjusted and settled, and that three years have elapsed from the date of such application and said ac-

count still remains unsettled and unadjusted, and that no suit upon the same has been brought by the United States, said court shall, due notice first being given to the head of said department and to the Attorney-General of the United States, proceed to hear the parties and to ascertain the amount, if any, due the United States on said account. The Attorney-General shall represent the United States at the hearing of said cause. The court may postpone the same from time to time whenever justice shall require. The judgment of said court or of the Supreme Court of the United States, to which an appeal shall lie, as in other cases, as to the amount due, shall be binding and conclusive upon the parties. The payment of such amount so found due by the court shall discharge such obligation. An action shall accrue to the United States against such principal, or surety, or representative to recover the amount so found due, which may be brought at any time within three years after the final judgment of said court. Unless suit shall be brought within said time, such claim and the claim on the original indebtedness shall be forever barred.

Sec. 4. That the jurisdiction of the respective courts of the United States proceeding under this act, including the right of exception and appeal, shall be governed by the law now in force, in so far as the same is applicable and not inconsistent with the provisions of this act; and the course of procedure shall be in accordance with the established rules of said respective courts, and of such additions and modifications thereof as said courts may adopt.

Sec. 5. That the plaintiff in any suit brought under the provisions of the second section of this act shall file a petition, duly verified, with the clerk of the respective court having jurisdiction of the case, and in the district where the plaintiff resides. Such petition shall set forth the full name and residence of the plaintiff, the nature of his claim, and a succinct statement of the facts upon which the claim is based, the money or other thing claimed, or the damages sought to be recovered, and praying the court for a judgment or decree upon the facts and law.

Sec. 6. That the plaintiff shall cause a copy of his petition filed under the preceding section to be served upon the district attorney of the United States in the district wherein suit is brought, and shall mail a copy of the same, by registered letter, to the Attorney-General of the United States, and shall thereupon cause to be filed with the clerk of the court wherein suit is instituted an affidavit of such service and the mailing of such letter. It shall be the duty of the district attorney upon whom service of petition is made as aforesaid to appear and defend the interests of the Government in the suit, and within sixty days after the service of petition upon him, unless the time should be extended by order of the court made in the case, to file a plea, answer, or demurrer on the part of the Government, and to file a notice of any counter-claim, set-off, claim for damages, or other demand or defense whatsoever of the Government in the premises: *Provided*, That should the district attorney neglect or refuse to file the plea, answer, demurrer, or defense as required, the plaintiff may proceed with the case under such rules as the court may adopt in the premises; but the plaintiff shall not have judgment or decree for his claim, or any part thereof, unless he shall establish the same by proof satisfactory to the court.

Sec. 7. That it shall be the duty of the court to cause a written opinion to be filed in the cause, setting forth the specific findings by the court of the facts therein and the conclusions of the court upon all questions of law involved in the case, and to render judgment thereon. If the suit be in equity or admiralty, the court shall proceed with the same according to the rules of such courts.

Sec. 8. That in the trial of any suit brought under any of the provisions of this act, no person shall be excluded as a witness because he is a party to or interested in said suit; and any plaintiff or party in

interest may be examined as a witness on the part of the Government.

Section 1079 of the Revised Statutes is hereby repealed. The provisions of section 1080 of the Revised Statutes shall apply to cases under this act.

Sec. 9. That the plaintiff or the United States, in any suit brought under the provisions of this act, shall have the same rights of appeal or writ of error as are now reserved in the statutes of the United States in that behalf made, and upon the conditions and limitations therein contained. The modes of procedure in claiming and perfecting an appeal or writ of error shall conform in all respects, and as near as may be, to the statutes and rules of court governing appeals and writs of error in like causes.

Sec. 10. That when the findings of fact and the law applicable thereto have been filed in any case as provided in section 6 of this act, and the judgment or decree is adverse to the Government, it shall be the duty of the district attorney to transmit to the Attorney-General of the United States certified copies of all the papers filed in the cause, with a transcript of the testimony taken, the written findings of the court, and his written opinion as to the same; whereupon the Attorney-General shall determine and direct whether an appeal or writ of error shall be taken or not; and when so directed the district attorney shall cause an appeal or writ of error to be perfected in accordance with the terms of the statutes and rules of practice governing the same: *Provided*, That no appeal or writ of error shall be allowed after six months from the judgment or decree in such suit. From the date of such final judgment or decree interest shall be computed thereon, at the rate of 4 per cent. per annum, until the time when an appropriation is made for the payment of the judgment or decree.

Sec. 11. That the Attorney-General shall report to Congress, and at the beginning of each session of Congress, the suits under this act in which a final judgment or decree has been rendered, giving the date of each, with a statement of the costs taxed in each case.

Sec. 12. That when any claim or matter may be pending in any of the Executive Departments which involves controverted questions of fact or law, the head of such department, with the consent of the claimant, may transmit the same, with the vouchers, papers, proofs, and documents pertaining thereto, to said Court of Claims, and the same shall be there proceeded in under such rules as the court may adopt. When the facts and conclusions of law shall have been found, the court shall report its findings to the department by which it was transmitted.

Sec. 13. That in every case which shall come before the Court of Claims or is now pending therein under the provisions of an act entitled "An act to afford assistance and relief to Congress and the Executive Departments in the investigation of claims and demands against the Government," approved March 3, 1883, if it shall appear to the satisfaction of the court, upon the facts established, that it has jurisdiction to render judgment or decree thereon under existing laws or under the provisions of this act, it shall proceed to do so, giving to either party such further opportunity for hearing as in its judgment justice shall require, and report its proceedings therein to either House of Congress or to the department by which the same was referred to said court.

Sec. 14. That whenever any bill, except for a pension, shall be pending in either House of Congress providing for the payment of a claim against the United States, legal or equitable, or for a grant, gift, or bounty to any person, the House in which such bill is pending may refer the same to the Court of Claims, who shall proceed with the same in accordance with the provisions of the act approved March 3, 1883, entitled "An act to afford assistance and relief to Congress and the Executive Departments in the investigation of claims and demands against the Government," and report to such House the facts in the case and the

amount, where the same can be liquidated, including any facts bearing upon the question whether there has been delay or laches in presenting such claim or applying for such grant, gift, or bounty, and any facts bearing upon the question whether the bar of any statute of limitation should be removed, or which shall be claimed to excuse the claimant for not having resorted to any established legal remedy.

SEC. 15. If the Government of the United States shall put in issue the right of the plaintiff to recover, the court may, in its discretion, allow costs to the prevailing party from the time of joining such issue. Such costs, however, shall include only what is actually incurred for witnesses and for summoning the same and fees paid to the clerk of the court.

SEC. 16. That all laws and parts of laws inconsistent with this act are hereby repealed.

The bill was approved by the President the same day.

Jan. 13, 1867, the House passed a measure regulating the jurisdiction of the circuit courts of the United States, which, in substantially the same form, had been passed by the House in the three preceding Congresses. Mr. Culberson, of Texas, said, in explanation of the measure: "The object of the bill is to diminish the jurisdiction of the circuit courts and the Supreme Court of the United States, to promote the convenience of the people, and to lessen the burden and expense of litigation. The methods employed by the bill are, first, to raise the minimum amount giving the circuit courts jurisdiction from \$500 to \$2,000. In the second place, we propose to take away from the circuit courts of the United States all jurisdiction of controversies between the assignees of promissory notes and the makers thereof, unless suit could have been maintained in such courts had no assignment been made. In the next place, the bill proposes to take away wholly from the circuit courts the jurisdiction now exercised by them over controversies in which one of the parties is a corporation organized under the laws of one State and doing business in another State. We propose to provide that the circuit courts shall have no jurisdiction over controversies of that sort; that whenever a corporation organized under the laws of one State shall carry on its business in another State, the corporation shall, for judicial purposes, be considered as a citizen of the State in which it is carrying on business.

"There is another provision in the bill in relation to the removal of causes from State to Federal courts. The provisions of the bill take away all right on the part of the plaintiff in a suit to remove his cause from a State to a Federal court after he has elected the forum in which to bring suit. The bill further provides that wherever the cause of action arises under the Constitution of the United States, or a law or treaty thereof, the defendant who is sued in a State court upon such a cause of action may remove the cause to a Federal court, provided he shall make it appear to the court in which the case is pending that his defense depends upon a proper construction of the Constitution of the United States, or some law or treaty thereof.

"The bill does not propose to repeal the act of 1867, which authorized either the plaintiff or the defendant in a suit pending in a State court to remove the cause from that court into a Federal court upon the ground of prejudice. That act is re-enacted, with a provision to this effect: that the plaintiff or the defendant, before he can remove the cause from the State to the Federal court, must satisfy the judge or court having jurisdiction of the cause of the truth of the matters alleged in his application for removal.

"This embodies, substantially, all the changes in the act. The effect of these changes I beg to refer to for a moment. The minimum jurisdiction of \$500 was placed in the original judiciary act in 1789, and it has been the law ever since. The population of the country then was 4,000,000, and now it is over 54,000,000. The amount of business of the country in the courts then and now sustain no comparison whatever.

"The next proposition is to deny the right of an assignee of a promissory note to bring suit in a Federal court. That was the law from 1789 until 1875. For ninety years the assignee of a promissory note, or any other chose in action, could not bring suit in a Federal court, unless a suit could have been maintained had no assignment been made.

"The increase of jurisdiction of the circuit courts of the United States, from that change of law in 1875, has multiplied the business in that court enormously, while it diminishes the business in the circuit courts, which are overloaded everywhere now. It also diminishes the business in the Supreme Court of the United States, which is three years behind on its docket.

"The withdrawal of the right to remove causes from State to Federal courts in the manner provided in this bill, after the plaintiff has selected his forum, will largely diminish the business in the circuit courts of the United States, and also the business in the Supreme Court of the United States in cases over \$5,000.

"The other proposition is to take away from the circuit courts of the United States jurisdiction over controversies between corporations created by the laws of a State and which go into other States and open offices and carry on business. For judicial purposes we make such corporations citizens of that State, and compel them to sue in the forum or in the courts of the State in which they carry on their business. Over one third of the business now in circuit courts of the United States and in the Supreme Court of the United States springs from this very jurisdiction to which I call your attention.

"And we deprive such corporation of the right to transfer that case or change it from a State to a Federal court.

"There is another provision in the bill to which I wish to call attention, and that is, it

repeals section 640 of the Revised Statutes, which empowers or authorizes a corporation created under an act of Congress, whenever sued in a State court, to remove the cause from such court to a Federal court upon a mere suggestion that the defense of such corporation to the cause of action arises under an act of Congress, or under the laws of Congress. We repeal that statute, and the bill provides whenever a corporation, or any one else, is sued in a State court and the defense of such corporation or individual depends upon a right construction of the laws of Congress, or of the Constitution of the United States, then such cause may be removed. And the bill does not attempt to interfere with the right of appeal in the last resort from the Supreme Court of a State to the Supreme Court of the United States."

March 2 the Senate amended and passed this measure, and reconsidered, amended, and repassed it March 3. The House non-concurred in the Senate amendments, but on conference receded from its non-concurrence; and March 3 the President approved the bill. It is as follows:

Be it enacted, etc., That the first section of an act entitled "An act to determine the jurisdiction of circuit courts of the United States, and to regulate the removal of causes from State courts, and for other purposes," approved March 3, 1875, be, and the same is hereby, amended so as to read as follows:

"That the circuit courts of the United States shall have original cognizance, concurrent with the courts of the several States, of all suits of a civil nature, at common law or in equity, where the matter in dispute exceeds, exclusive of interest and costs, the sum or value of \$2,000, and arising under the Constitution or laws of the United States, or treaties made, or which shall be made, under their authority, or in which controversy the United States are plaintiffs or petitioners, or in which there shall be a controversy between citizens of different States, in which the matter in dispute exceeds, exclusive of interest and costs, the sum or value aforesaid, or a controversy between citizens of the same State claiming lands under grants of different States, or a controversy between citizens of a State and foreign states, citizens, or subjects, in which the matter in dispute exceeds, exclusive of interest and costs, the sum or value aforesaid, and shall have exclusive cognizance of all crimes and offenses cognizable under the authority of the United States, except as otherwise provided by law, and concurrent jurisdiction with the district courts of the crimes and offenses cognizable by them. But no person shall be arrested in one district for trial in another in any civil action before a circuit or district court; and no civil suit shall be brought before either of said courts against any person by any original process or proceeding in any other district than that whereof he is an inhabitant; but where the jurisdiction is founded only on the fact that the action is between citizens of different States, suit shall be brought only in the district of the residence of either the plaintiff or the defendant; nor shall any circuit or district court have cognizance of any suit, except upon foreign bills of exchange, to recover the contents of any promissory note or other chose in action in favor of any assignee, or of any subsequent holder if such instrument be payable to bearer and be not made by any corporation, unless such suit might have been prosecuted in such court to recover the said contents if no assignment or transfer had been made; and the circuit courts shall also have appellate jurisdiction from the

district courts under the regulations and restrictions prescribed by law."

That the second section of said act be, and the same is hereby, amended so as to read as follows:

"SEC. 2. That any suit of a civil nature, at law or in equity, arising under the Constitution or laws of the United States, or treaties made, or which shall be made, under their authority, of which the circuit courts of the United States are given original jurisdiction by the preceding section, which may now be pending, or which may hereafter be brought, in any State court, may be removed by the defendant or defendants therein to the circuit court of the United States for the proper district. Any other suit of a civil nature, at law or in equity, of which the circuit courts of the United States are given jurisdiction by the preceding section, and which are now pending, or which may hereafter be brought, in any State court, may be removed into the circuit court of the United States for the proper district by the defendant or defendants therein being non-residents of that State." And when in any suit mentioned in this section there shall be a controversy which is wholly between citizens of different States, and which can be fully determined as between them, then either one or more of the defendants actually interested in such controversy may remove said suit into the circuit court of the United States for the proper district. And where a suit is now pending, or may be hereafter brought, in any State court, in which there is a controversy between a citizen of the State in which the suit is brought and a citizen of another State, any defendant, being such citizen of another State, may remove such suit into the circuit court of the United States for the proper district, at any time before the trial thereof, when it shall be made to appear to said circuit court that from prejudice or local influence he will not be able to obtain justice in such State court, or in any other State court to which the said defendant may under the laws of the State, have the right, on account of such prejudice or local influence, to remove said cause: *Provided*, That if it further appear that said suit can be fully and justly determined as to the other defendants in the State court, without being affected by such prejudice or local influence, and that no party to the suit will be prejudiced by a separation of the parties, said circuit court may direct the suit to be remanded, so far as relates to such other defendants, to the State court, to be proceeded with therein. At any time before the trial of any suit which is now pending in any circuit court or may hereafter be entered therein, and which has been removed to said court from a State court on the affidavit of any party plaintiff that he had reason to believe and did believe that, from prejudice or local influence, he was unable to obtain justice in said State court, the circuit court shall, on application of the other party, examine into the truth of said affidavit and the grounds thereof, and, unless it shall appear to the satisfaction of said court that said party will not be able to obtain justice in such State court, it shall cause the same to be remanded thereto. Whenever any cause shall be removed from any State court into any circuit court of the United States, and the circuit court shall decide that the cause was improperly removed, and order the same to be remanded to the State court from whence it came, such remand shall be immediately carried into execution, and no appeal or writ of error from the decision of the circuit court so remanding such cause shall be allowed.

That section 3 of said act be, and the same is hereby, amended so as to read as follows:

"SEC. 3. That whenever any party entitled to remove any suit mentioned in the next preceding section, except in such cases as are provided for in the last clause of said section, may desire to remove such suit from a State court to the circuit court of the United States, he may make and file a petition in such suit in such State court at the time, or any time before the defendant is required by the laws of the State or the rule of

the State court in which such suit is brought to answer or plead to the declaration or complaint of the plaintiff, for the removal of such suit into the circuit court to be held in the district where such suit is pending, and shall make and file therewith a bond, with good and sufficient surety, for his or their entering in such circuit court, on the first day of its then next session, a copy of the record in such suit, and for paying all costs that may be awarded by the said circuit court if said court shall hold that such suit was wrongfully or improperly removed thereto, and also for their appearing and entering special bail in such suit if special bail was originally requisite therein. It shall then be the duty of the State court to accept said petition and bond, and proceed no further in such suit, and the said copy being entered as aforesaid in said circuit court of the United States, the cause shall then proceed in the same manner as if it had been originally commenced in the said circuit court; and if in any action commenced in a State court the title of land be concerned, and the parties are citizens of the same State, and the matter in dispute exceed the sum or value of \$2,000, exclusive of interest and costs, the sum or value being made to appear, one or more of the plaintiffs or defendants, before the trial, may state to the court, and make affidavit if the court require it, that he or they claim and shall rely upon a right or title to the land under a grant from a State, and produce the original grant, or an exemplification of it, except where the loss of public records shall put it out of his or their power, and shall move that any one or more of the adverse party inform the court whether he or they claim a right or title to the land under a grant from some other State, the party or parties so required shall give such information, or otherwise not be allowed to plead such grant or give it in evidence upon the trial; and if he or they inform that he or they do claim under such grant, any one or more of the party moving for such information may then, on petition and bond, as hereinbefore mentioned in this act, remove the cause for trial to the circuit court of the United States next to be holden in such district; and any one of either party removing the cause shall not be allowed to plead or give evidence of any other title than that by him or them stated as aforesaid as the ground of his or their claim.

SEC. 2. That whenever in any cause pending in any court of the United States there shall be a receiver or manager in possession of any property, such receiver or manager shall manage and operate such property according to the requirements of the valid laws of the State in which such property shall be situated, in the same manner that the owner or possessor thereof would be bound to do if in possession thereof. Any receiver or manager who shall willfully violate the provisions of this section shall be deemed guilty of a misdemeanor, and shall, on conviction thereof, be punished by a fine not exceeding \$3,000, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

SEC. 3. That every receiver or manager of any property appointed by any court of the United States may be sued in respect of any act or transaction of his in carrying on the business connected with such property, without the previous leave of the court in which such receiver or manager was appointed; but such suit shall be subject to the general equity jurisdiction of the court in which such receiver or manager was appointed, so far as the same shall be necessary to the ends of justice.

SEC. 4. That all national banking associations established under the laws of the United States shall, for the purposes of all actions by or against them, real, personal, or mixed, and all suits in equity, be deemed citizens of the States in which they are respectively located; and in such cases the circuit and district courts shall not have jurisdiction other than such as they would have in cases between individual citizens of the same State.

The provisions of this section shall not be held to

affect the jurisdiction of the courts of the United States in cases commenced by the United States or by direction of any officer thereof, or cases for winding up the affairs of any such bank.

SEC. 5. That nothing in this act shall be held, deemed, or construed to repeal or affect any jurisdiction or right mentioned either in sections 641, or in 642, or in 643, or in 722, or in title 24 of the Revised Statutes of the United States, or mentioned in section 8 of the act of Congress of which this act is an amendment, or in the act of Congress approved March 1, 1875, entitled "An act to protect all citizens in their civil and legal rights."

SEC. 6. That the last paragraph of section 5 of the act of Congress approved March 3, 1875, entitled "An act to determine the jurisdiction of circuit courts of the United States and to regulate the removal of causes from State courts, and for other purposes," and section 640 of the Revised Statutes, and all laws and parts of laws in conflict with the provisions of this act, be and the same are hereby repealed: *Provided*, That this act shall not affect the jurisdiction over or disposition of any suit removed from the court of any State, or suit commenced in any court of the United States, before the passage hereof except as otherwise expressly provided in this act.

SEC. 7. That no person related to any justice or judge of any court of the United States by affinity or consanguinity, within the degree of first cousin, shall hereafter be appointed by such court or judge to, or employed by such court or judge in, any office or duty in any court of which such justice or judge may be a member.

The bill as first passed by the Senate had a section providing that the salaries of district court judges be \$5,000 a year, but on reconsideration that section was dropped, as it was feared that the House would not consent to a conference if it were retained.

Pacific Railroad Investigation.—Jan. 18, 1887, the House passed a joint resolution authorizing an investigation of the books, accounts, and methods of the Pacific Railroads, which have received aid from the United States. The measure was referred to the Judiciary Committee of the Senate, which reported the following substitute, by way of amendment:

Be it enacted, etc., That the President of the United States, by and with the advice and consent of the Senate, be, and he is hereby, authorized to appoint three commissioners, whose compensation shall be \$750 per month to each, and the necessary traveling expenses and board bills, for which proper vouchers shall be returned, to be approved by the Secretary of the Interior; and said commission may appoint a stenographer, if necessary, and fix his compensation; and the persons appointed on the said commission shall have power to examine all books, papers, and methods of the companies hereinafter named, employ experts, if necessary; and they shall at all times be under the immediate direction and control of the President of the United States, and may, at any time, be removed by him in his discretion.

SEC. 2. That the duty of said commission shall be to examine into the working and financial management of all of the railroads that have received aid from the Government in bonds; to ascertain whether they have observed all the obligations imposed upon them by the laws of the United States under which they received such aid, or which have been since passed in reference thereto, and complied with all other obligations to the United States; and whether their books and accounts are or have been so kept as to show the net earnings of the aided roads, and what said books and accounts actually show in regard thereto, and what have been in fact said net earn-

ings; or whether there has been a diversion of earnings of aided roads to less productive branches, through constructive mileage allowances, or average mileage allowances between aided and non-aided roads or parts of roads, or otherwise; and also whether such system of constructive mileage allowances is fair and usual, and in practical operation has resulted adversely or otherwise to the aided roads and the interest of the United States; or whether there has been a diversion of earnings of aided roads to wrongful or improper purposes, and, if so, to what extent; whether there is a discrimination of rates in favor of unaided against aided roads; whether any, and if so, how much, money is due and owing to the United States on account of mistaken or erroneous accounts, reports or settlements made by said roads; whether any traffic or business which could or should be done on the aided lines of said companies has been diverted to the lines of any other company or to non-aided lines, and what amounts have been deducted from the gross earnings of any of said aided railroad companies, by their general freight and passenger agents or auditors, by way of rebate, percentage of business done, constructive mileage, monthly or other payments on any pooling or rate arrangement, contract, or agreement; and also to inquire into, ascertain, and report as to the kind, character, and amount of the assets of said companies, and what assets of each company are now subject to the lien of the Government, and the value thereof; and also whether any dividends have been unlawfully declared by the directors or paid to the stockholders of said companies, and, if so, to what extent, and whether the amount thereof may not be recovered from the directors unlawfully declaring the same or persons who have unlawfully received the same; whether the proceeds of any trust funds or lands loaned, advanced, or granted have been diverted from their lawful use; whether any new stock or bonds have been issued or any guarantees or pledges made contrary to or without authority of law; whether any of the directors, officers, or employés of said companies, respectively, have been or are now directly or indirectly interested, and to what amount or extent, in any other railroad, steamship, telegraph, express, mining, construction, or other business company or corporation, and with which any agreements, undertakings, or leases have been made or entered into; what amounts of money or credit have been or are now loaned by any of said companies to any person or corporation; what amounts of money or credit have been or are now borrowed by any of said companies, giving names of lenders and the purposes for which said sums have been or are now required; what amounts of money or other valuable consideration, such as stocks, bonds, passes, and so forth, have been expended or paid out by said companies, whether for lawful or unlawful purposes, but for which sufficient and detailed vouchers have not been given or filed with the records of said companies; and, further, to inquire and report whether said companies, or either of them, or their officers or agents, have paid any money or other valuable consideration, or done any other act or thing, for the purpose of influencing legislation; and to investigate and report all the facts relating to an alleged consolidation of the Union Pacific Railroad Company, the Kansas Pacific Railway Company, and the Denver Pacific Railway and Telegraph Company into an alleged corporation known as the Union Pacific Railway Company. Said investigation shall include the alleged sale of the stock of the Kansas Pacific Railroad Company to the Union Pacific Railroad Company, and all the circumstances and particulars pertaining to said alleged sale, and whether any of the Pacific Railroad corporations, which obtained bonds from the United States to aid in the construction of their railroads have expended any of their moneys or other assets in the construction, or to aid in the construction, of other railroads, or invested of their moneys or other assets in the stocks or bonds of any manufacturing, mining, and com-

mercial companies or corporations, or of other railroad corporations; and if any such expenditures, or investments have been made, the extent and character thereof made by each of said corporations shall be inquired into, and also the present interest of any of said corporations in the railroads auxiliary to their respective railroads.

And said commission shall also ascertain and report the names of all the stockholders in each of said companies, from its organization to the date of the investigation herein provided for, as they appear on the books of said companies at the date of its annual meeting in each year; the amount of stock held by each; what consideration, if any, was paid by each stockholder to said company for his stock, and when and in what properly such payment was made; the date when each stockholder so appearing on the books became such; and whether stock is now held or has heretofore been held in the name of any person in trust or for the benefit of any other, and the names of all such persons; the total amount of the stock in each company, and the dates and amount of any increase of such stock, and the reason for such increase; and the amount of the annual salaries or compensation that are now or at any prior time have been paid to any officer or employé of said company, when such salary or compensation amounts to \$5,000 or more per annum, and the names of the persons now receiving or who have heretofore received such salaries or compensation, and all bonuses or donations which may have been given or paid to any such person; and all payments made under the head of legal expenses, to whom made, and the amount paid to each, and for what specific services such payments were made.

Said commissioners shall also consider and report whether the interests of the United States require any extension of the time for the performance of the obligations to the United States of said companies, or any of them, and the facts and circumstances upon which said opinion is based, including the security held by the United States for the performance of such obligations, and the value thereof, and the value of the property of such companies, and either of them, not included in such security, and what further security it is expedient that said companies shall be required to give; and if, in their opinion, such extension shall be required by the interests of the United States, they shall submit a scheme for such extension, which shall secure to the United States full payment of all debts due them from said companies, with a reasonable rate of interest, in such time as the commissioners shall propose, having due regard to the financial ability of said companies and the proper conduct of their business in such manner as shall afford efficient service to the public.

And the said commission shall report in full in regard to all such matters aforesaid, and in regard to any other matters which may be ascertained or come to their knowledge in regard to said companies, respectively, on or before Dec. 1, 1887, to the President of the United States, who shall forward said report to Congress, with such recommendations or comments as he may see fit to make in the premises.

That the commissioners hereby created, or either of them, shall have power to require the attendance and testimony of witnesses, and the production of all books, papers, contracts, agreements, and documents relating to the matter under investigation, and to administer oaths; and to that end may invoke the aid of any court of the United States in requiring the attendance and testimony of witnesses, and the production of books, papers, and documents under the provisions of this section. Any of the circuit or district courts of the United States within the jurisdiction of which such inquiry is carried on may, in case of contumacy or refusal to obey a subpoena issued to any person, issue an order requiring any such person to appear before said commissioners, or either of them, as the case may be, and produce books and

papers if so ordered, and give evidence touching the matter in question; and any failure to obey such order of the court may be punished by such court as a contempt thereof.

The claim that any such testimony or evidence may tend to criminate the person giving such evidence shall not excuse such witness from testifying; but such evidence or testimony shall not be used against such person on the trial of any criminal proceeding.

Sec. 3. That the sum of \$100,000, or so much thereof as may be necessary, is hereby appropriated, out of any money in the Treasury of the United States not otherwise appropriated, for the purposes of this investigation.

Sec. 4. That whenever, in the opinion of the President, it shall be deemed necessary, to the protection of the interests and the preservation of the security of the United States, in respect of its lien, mortgage, or other interest in any of the property or any or all of the several companies upon which a lien, mortgage, or other incumbrance paramount to the right, title, or interest of the United States for the same property, or any part of the same, may exist and be then lawfully liable to be enforced, the Secretary of the Treasury shall, under the direction of the President, redeem or otherwise clear off such paramount lien, mortgage, or other incumbrance by paying the sums lawfully due in respect thereof out of the Treasury; and the United States shall thereupon become and be subrogated to all rights and securities theretofore pertaining to the debt, mortgage, lien, or other incumbrance in respect of which such payment shall have been made. It shall be the duty of the Attorney-General, under the direction of the President, to take all such steps and proceedings, in the courts and otherwise, as shall be needful to redeem such lien, mortgage, or other incumbrance, and to protect and defend the rights and interests of the United States in respect of the matters in this section mentioned, and to take steps to foreclose any mortgages or liens of the United States on any such railroad property.

Sec. 5. That from and after the 1st day of July, 1887, there shall be charged to and collected from the Central Pacific Railroad Company, the Union Pacific Railway or Railroad Company, by whichever description it may be lawfully known, the Central Branch Union Pacific Railway Company, the Sioux City and Pacific Railroad Company, and the Kansas Pacific Railway Company, as all the same are described and known in the acts of Congress providing for issuing bonds in aid of the same, or acts in addition thereto, their successors and assigns, respectively, 40 per cent. of their respective annual net earnings, to be ascertained as provided in section 1 of the act of May 7, 1878, in lieu of the 25 per cent. provided for in said act, so far as the same respects the companies mentioned in said act, and as to the others herein mentioned absolutely; and to that end the said act of May 7, 1878, and any and all amendments or modifications thereof, be and the same are hereby extended to the Kansas Pacific Railway Company, to the Sioux City and Pacific Railroad Company, and to the Central Branch Union Pacific Railway Company; and said act, and all amendments thereto or modifications thereof, shall henceforth apply to the said respective corporations herein last named, as well as to the corporations named in said act.

Sec. 6. That the sinking-funds which are or may be held in the Treasury for the security of the indebtedness of either or all of said railroad companies may, in addition to the investments now authorized by law, be invested in any bonds of the United States heretofore issued for the benefit of either or all of said companies, or in any of the first-mortgage bonds of either of said companies which have been issued under the authority of any law of the United States and secured by mortgages of their roads and franchises, which by any law of the United States have been made prior and paramount to the mortgage, lien, or other security of the United States in respect

of its advances to either of said companies as provided by law.

February 25, the subject came up for discussion in the Senate, and, in Committee of the Whole, on motion of Mr. McPherson, of New Jersey, the fifth and sixth sections were struck out by a vote of 26 yeas to 14 nays. In explanation of the motion, he said: "Let me simply state the fact that while the 40 per cent. increase upon the basis of the net earnings of the Union and the Central Pacific Railroads for 1884 and 1885 would require the Union Pacific Railroad to pay into the public Treasury something over \$2,600,000 annually, a sum of something like \$600,000 in excess of the entire interest account paid by the Government, and \$1,400,000 more than it now pays on account of net earnings and transportation account into the public Treasury, it would only compel the Central Pacific Railway Company to pay \$129,000 additional, or a sum equal to \$1,800,000 less than the Government pays annually upon its interest account. Hence you will see the inequality of the application of the 40 per cent. Therefore, as it is likely to provoke discussion, I shall ask the Senate to strike out everything in the shape of new legislation, and take the resolution of investigation pure and simple."

Subsequently the Senate, on considering the report of the Committee of the Whole, restored section 6, on motion of Mr. Edmunds, of Vermont, by a vote of 37 to 9, but refused to restore section 5 by a vote of 15 to 26. A motion by Mr. McPherson to strike out section 4 was defeated by a vote of 19 to 27. A motion was made by Mr. Riddleberger, of Virginia, to strike out the following clause of section 2:

The claim that any such testimony or evidence may tend to criminate the person giving such evidence shall not excuse such witness from testifying; but such evidence or testimony shall not be used against such person on the trial of any criminal proceeding.

It failed by a vote of 18 to 25. On motion of Mr. Stanford, of California, the following amendments were inserted in section 2:

The commissioners shall also ascertain the average cost per annum of Government transportation in the regions now traversed by the Pacific Railroads between the year 1850 and the completion of said roads, and also the average cost per annum since such completion, and what additional facilities have been furnished to the Government and the people by said roads.

Also to inquire what discount the Pacific Railroad and its several branches were forced to make in disposing of the bonds guaranteed by the Government to obtain the gold coin which was the currency of the country through which the greater part of said roads passed. Also to ascertain the comparative cost of construction of said roads as compared with what they would have cost with the prices of labor and commodities prevailing five years preceding or five years subsequent to the completion of said roads.

Also to inquire whether or not the Pacific Railroad was completed in less time than was allowed by law, and, if so, how much less time, and if the United States was benefited thereby. Also to inquire if either of the Pacific Railroad companies have been embarrassed and the earning capacity impaired by

antagonistic local or State legislation. Also to inquire if the United States, since the Union and Central Pacific Railroad Companies accepted the terms proposed by Congress for the construction of the Pacific Railroad, has granted aid in land for building competing parallel roads to the said Pacific Railroad, and, if so, how many such roads, and to what extent such competing lines, have impaired the earning capacity of the Pacific Railroads.

Also to inquire if the United States have contracts with the branch roads controlled by either of said Pacific roads for carrying United States mails, and, if so, what service has been performed by them, and what money, if any, has been paid for said service, and what remains due and unpaid, and if the United States, by failing to pay for said mail service, has embarrassed said railroad companies or either of them in paying their indebtedness to the United States.

Also to inquire if the several Pacific Railroad companies have complied with the provisions of the act "to alter and amend an act entitled 'An act to aid in the construction of a railroad and telegraph line from the Missouri River to the Pacific Ocean, and to secure to the Government the use of the same for postal, military, and other purposes,' approved July 1, 1862; also to alter and amend an act of Congress approved July 2, 1864, in amendment of the said first-named act," commonly known as the Thurman act, and, if not, in what particulars they have failed to comply. Also to inquire what sums the Pacific Railroads and their branches can severally pay annually on account of their indebtedness to the United States without imposing such burdens upon the people, and particularly upon the localities through which the roads pass, as to retard the development of the country.

On motion of Mr. Plumb, of Kansas, the following clause was inserted in the same section:

Said commission shall also inquire into and report upon the relations of said railroads to the interests of the communities through which they pass, and all questions concerning the payment of taxes, especially upon lands granted by Congress, and the delay of said companies in taking out patents for such lands, the rates of fare and freight charged, discrimination, differential pools, and other devices, and the facilities and accommodations furnished to the patrons of such roads, and their report shall embrace a consideration of the interests and rights of said communities as effected by whatever plan of settlement the payment of the existing debt may be proposed.

In the course of the debate on the measure, Mr. Sherman, of Ohio, said of section 4:

"This proposes to place in the hands of a President of the United States to be elected eight or ten years hence the enormous power of assuming the payment of \$65,000,000 indebtedness. It does not invest him with the power to take the money from the Treasury, because the criticism made by the Senator from Massachusetts (Mr. Dawes) is perfectly just. You may impose a duty upon the President of the United States, whatever it may be, and yet he can not take one dollar from the Treasury, except in pursuance of an appropriation made by express law. That appropriation can only be expressed in such words as these, that so much money be appropriated out of any money in the Treasury not otherwise appropriated. Consequently, this is mere *brutum fulmen*; it does not amount to anything, except that it confers, nominally at least, a very dangerous power long years in advance of the time for its exercise.

"The Senator from New Jersey suggested

that these companies might default in their interest. They have never thought of such a thing. Such a thing is not to be conceived of as possible. That interest must be paid and is paid as promptly and as regularly as the interest on the bonds of the United States, because it is a primary lien on all these roads. That is, therefore, a contingency which need not be provided for by law.

"This is an intimation that these railroad companies intend to commit an act of bankruptcy, when there is no such disposition and no sign of such an act. It is to suggest a state of things that has not occurred to the mind of mortal man, because standing back of and behind these first-mortgage securities there is an immense interest, amounting to over \$130,000,000 or \$140,000,000. Therefore, the contingency of the companies failing to pay the interest on these bonds or their failure to pay the bonds on maturity is a thing not to be thought of, at least for ten years, and consequently it is a mere idle section threatening the credit of these companies to even suggest the possibility that the interest is not to be paid on these first-mortgage bonds, which are high in the market, equal to the bonds of the United States. Such a suggestion as this in a law of this kind, passed by both Houses of Congress, appears to be a mere effort, you may say, to bear down these bonds, to toss them into the market as discredited and suspected by the Congress of the United States."

Mr. Hoar, of Massachusetts, said in discussing the relations of the Pacific Railroads to the Government:

"There is not one single dollar due to this Government from any of these roads—not one, and will not be until the year 1897, or thereabout. The United States Government agreed, in consideration of the enormous risk of the original builders of this road, that they would lend them these Government bonds, and they should not be called upon to pay back either principal or annual interest till their maturity at the end of thirty years.

"What the Government did by the Thurman act was not to come in as a creditor who had made a bargain and break it, to repudiate their contract with these men—not at all. They said that under our supervising power as a government we will require you to pay into a sinking-fund a sum of money, so that there shall be some preparation toward the payment of your debt at maturity. Now, what is the result of that process? That sinking-fund is required by law at this moment to be invested in securities which pay only 2-2 per cent. annually of interest.

"As to the money expended on the road, the Senator from Mississippi says they buy everything on credit, and do not pay cash for anything. They find a road that has been built by somebody else with a bond and mortgage, and they buy the equity and pay for it, and have to pay the interest on those bonds, and

they have a property which at the present rates at which it sells in the stock market, having a capital stock of \$60,000,000, is worth \$33,750,000—the Union Pacific Railroad alone at this moment—beyond all the debts that it owes, Government debts and everything else.

"If you will just pass a law: 'You shall do just what you have a mind to, and if you pay off our debt at maturity it is all that we will ask'; they can take advantage of a favorable condition in the money market and raise the money and pay every cent they owe you before 1897. We do not ask the Government to extend its debt. They will find a new creditor who will let them have money on fifty, sixty, or seventy-five years with 8 or 4 per cent. interest, and pay you, and pay the first-mortgage bonds, too.

"What you are doing by this 40-per-cent. business of yours is to say to this railroad company: 'You shall not use your money as you please, as you would let another debtor, as you would have to let him because you could not help yourself; you shall not put it where it serves the public and pays an income, as Mr. Adams shows in his report it does, of from 8 to 10 per cent., but you shall take this amount of money which you are getting 8 or 10 per cent. for now, and for twelve years lock it up where you can get only 2 per cent., and put it into a sinking-fund; not that you can pay us anything that is due now, but that you can be ready to pay us in the year 1897.'

"Remember this is not a creditor laying his hand on the debtor's property. It is the guardian of the ward; it is the paternal Government or non-paternal Government saying, 'We propose only to make you manage your property reasonably, with reference to the fact that you have a debt coming due in twelve years.' That is the only assertion of authority under which this is vindicated at all, and I affirm, Mr. President, on my serious responsibility, that there never was a more wicked, unjust, monstrous proposition than this proposition is, if you strip it of the mistakes which have deceived honorable and just gentlemen on this floor and elsewhere, and come to understand it in all its relations.

"Here is a railroad that you said you would lend this money to, and they should not pay you until 1897, and now you come in twelve years before, when they have so managed their property that it is worth beyond all their debts, yours and every other, by the unerring test of the stock-market, \$33,750,000, and you say, 'Take every single dollar that you want to occupy new territory with against rival lines, every single dollar that you want for an improvement over 4,600 miles of railroad territory, every single dollar that you want to secure increased safety with for passengers, for life and property and character; take every single dollar, and strip yourself of your credit which is necessary to carry on your road and have it hold up its head, and put your money

out at 2 per cent. and lock it up for twelve years'; and Senators are going to be frightened into a performance of that kind by anonymous articles in irresponsible New York newspapers, if they do it at all."

Senator McPherson, of New Jersey, said in answer:

"I have been earnest, I have been persistent in demanding that this resolution be brought to the attention of the Senate. Sir, the conduct of Congress within the last six months has been the most humiliating in its history. Bills have been brought before the Senate and House of Representatives seeking a settlement with different Pacific railroads on terms which would grant to them, if passed, a larger subsidy than was ever heretofore given to them at any time. If the bill reported by the honorable Senator from Massachusetts, known as the funding bill—as to which I will here and now do him the credit to say that as soon as he discovered its character he immediately withdrew it from the attention of the Senate—if that bill had passed the Senate, the stock of the Union Pacific Railroad would have gone up 50 per cent. Why? It contemplated giving them a larger subsidy than the entire amount of the original subsidy bonds.

"That bill was reported by the Judiciary Committee, an honorable and intelligent committee, and now that same committee bring before the Senate as an addendum or as a rider to this resolution, which was simply a resolution of inquiry, what? An amendment which applies mainly to one line of railroad, to wit, the Union Pacific. If that amendment had been incorporated into this resolution, the stock of the Union Pacific Railroad in an hour would have fallen 50 per cent.

"Now, I want to know why the honorable Senator from Massachusetts charges newspapers in the city of New York with being stock-jobbing newspapers. There is no agency upon earth which has been so influential as the Judiciary Committee of the Senate to enable stock-jobbers to make money; in the first place, on the funding bill, and, in the next place, to bear the stock on the resolution now before the Senate. I have no sympathy with such talk.

"There are such things, of course, as stock-jobbing newspapers. Why not stock-jobbing newspapers as well as stock-jobbing men? But for the Senator from Massachusetts or myself to say that the great influential journals in the city of New York were engaged in a stock-jobbing scheme because they opposed the passage of the funding bill, is to my mind exceedingly unjust. I do not believe they were controlled by any such mercenary motive; and certainly if this resolution becomes a law and the investigation of these Pacific Railroads can be made under the resolution full, thorough, and sufficient, it will reveal to my mind a condition of corruption and extravagance never known before in the history of this country."

Mr. Edmunds, of Vermont, in arguing for an advance in the amount to be paid into the treasury annually by the Pacific Railroads from 25 per cent. to 40 per cent. of the net earnings, said:

"Now, let us see first where the United States stands as respects its securities for the advances that it made. I have here the statute itself of 1862, which is precisely like that of 1864 as far as these matters are concerned, except that by the act of 1864 the first-mortgage bonds, as they now are, of these two railway companies were then second-mortgage bonds, but they were transposed and advanced over the United States subsidy bonds by the act of 1864. But so far as it respects the mortgage, the lien, the right of the United States for security for the forty, or fifty, or sixty million dollars of its advance, the act of 1862 will answer my purpose, as I happen to have it before me.

"Let us see on what property the security of the United States rests as to the Union and the Central Pacific Railway Companies. I am speaking now chiefly of the Union Pacific because it is true, as the Senator from California has said, that the Central Pacific has at all times done everything that the statutes of the United States required it to do. Whether it had an offset or whatever, it obeyed the law and awaited its time to get the money that it might otherwise have applied back again. What does this act provide as to the security of the United States? The United States shall issue bonds, etc.:

The issue of said bonds and delivery to the company shall *ipso facto* constitute a first mortgage on the whole line of the railroad and telegraph, together with the rolling-stock, fixtures, and property of every kind and description, and in consideration of which said bonds may be issued; and on the refusal or failure of said company to redeem said bonds, or any part of them, when required so to do by the Secretary of the Treasury, in accordance with the provisions of this act the said road, with all the rights, functions, immunities and appurtenances thereunto belonging, and also all lands granted to the said company by the United States, which, at the time of said default, shall remain in the ownership of the said company, may be taken possession of by the Secretary of the Treasury for the use and benefit of the United States: *Provided*, This section shall not apply to that part of any road now constructed.

"It took in by provision some roads in some State, I believe. Now, then, the road which Congress authorized this company to build was, as it has turned out when it is planted on the face of the earth, a road from Omaha to Ogden—I am now speaking of the Union Pacific—and it was nothing else. The bonds of the United States, to the amount of the dollars that I may mention by-and-by, were issued upon the strength of that security and that rolling-stock and the fixtures that belonged to those 1,034 miles of road as now constructed.

"Then there was the Kansas Pacific branch, as it was called, which was part of the same system in this incorporation, on which for 365

miles, or whatever the distance was, bonds of the United States were also issued, which I will come to by-and-by. There was our security for this money advanced for the building of the road.

"Now the question is whether under the act of 1878, called the Thurman act, the 25 per cent. of net earnings is to be computed upon and taken out of the earnings and gains and profits and receipts of the Union Pacific Railroad Company and the Central Pacific Railroad Company for all the other lines in which they are interested besides these main lines."

Interrupting him, Mr. Morgan, of Alabama, said:

"I ask the Senator whether or not section 5 of the act of incorporation does not cover all the roads that may be in the ownership of this company at the time of the default made in the payment of the bonds, and whether this statutory mortgage does not extend over all the road that it may own at that time and subsequently acquired, being 'all the rights, functions, immunities, and appurtenances belonging . . . at the time of said default.'"

And Mr. Edmunds continued:

"I am extremely sorry to say that according to the decisions of the Supreme Court as I understand them—and I am afraid they are right in point of law—it does not, and I am extremely sorry to say for the interests of the tax-payers of the United States that so far as I know not a single one of what are called these branch roads and extensions belongs either to the Central Pacific or the Union Pacific Railroad corporation as such. They are separate corporations, the stock of which is held or controlled by these corporations of which they have perpetual leases so that the lien of the United States under this statutory mortgage, when you come to bring it down to judicial determination if the bonds were due yesterday and there was a foreclosure to-day, will be the right of the United States to foreclosure upon the line of road from Omaha to Ogden, to take the Union Pacific which is enough for my purpose to illustrate this matter, or if you take the Central Pacific from Ogden to Sacramento and perhaps taking in the Western Pacific with which it was consolidated going down toward and perhaps to San Francisco, but not the vast system of State railways that the Central Pacific got the control and real ownership and possession of which were not under the mortgage at all.

"That being the state of the case, let us see how much money was paid out and how much land was paid out on that kind of security. I have the report of the Railroad Commissioner, who stands impartial between the tax-payers and these corporations, for 1885, in my hands, and then I have later that of 1886, which does not state differently at all on this question of how the matter stands.

"We find by this report that in respect of

the Union Pacific Railroad Company the United States has issued its own bonds to the amount of \$27,236,512; that interest accrued and not yet paid by the United States because the coupons have not been presented, amounts to \$817,095.86; that the interest already paid by the United States to the 1st of July, 1885—and this report was made up to that date—was \$27,409,136.49. Out of that is to be taken, according to this tabular statement, for transportation and cost of the 5 per cent. of the net earnings in the first place, \$10,647,579.86, and the 5 per cent. of the net earnings reserved in the Treasury \$283,162.99, making a balance of interest paid by the United States, besides the \$817,095.86 of outstanding coupons yet to be paid, \$16,478,394.14.

"So, as the Commissioner states it, the state of the accounts between the United States and the Union Pacific Railroad Company on the 1st of July, 1885, sums up in this way: The total debt of the Union Pacific, including the Kansas Pacific, is \$33,539,512 of principal; accrued interest on the bonds that we are paying the interest on, \$35,111,924.94, making on the 1st of July, 1885—there being still twelve years on an average of interest yet to be paid, which would make 72 per cent. of the original \$33,000,000 of the debt—\$68,651,436.94.

"There is twelve years of interest yet on \$33,000,000, which would be, at 6 per cent., 72 per cent. on \$33,000,000, which, in round numbers, is three quarters of that, which would be about \$24,000,000 more, which added to your \$68,000,000, leaving off the odd hundred thousands, would make \$92,000,000, that within ten years from this date will be due to the United States from this corporation for actual cash that the United States will have paid out.

"Now, what else did it get? Let us see. The land question is stated in the same report. The net proceeds of land-sales, after deducting all expenses of management, commission, etc., to Dec. 31, 1884, were \$25,668,806.65. Add that twenty-five million dollars to the ninety-odd millions that I had before and you have, in round numbers, just about \$120,000,000 of cash that this company will have had from the United States.

"The estimated value of the unsold lands is \$18,602,696.25.

"Take that to be a fair estimate of that value and add that to your \$120,000,000, and you have \$134,000,000 that the people of the United States have paid into this thousand miles of road from Omaha to Ogden."

After citing the Supreme Court decision to the effect that the 25-per-cent. payment from the Pacific Railroads on their net earnings under the provisions of the Thurman act was simply computed on the earning of the "aided" part of the lines, the Senator said:

"What became of the balance of the 75 per cent.? For some years after this act of Congress was passed, and which denounced penalties against any director or officer of the

company who, until they met the obligations of the United States and to the creditors by paying into the sinking-fund, should declare any dividend, the companies proceeded year after year to declare dividends, and to pay them, and but for this statute they might do it; it was 'net,' everything to carry on the road and keep it in the best possible condition was authorized to be drawn out before the 25 per cent. was computed, and it was drawn out, and then that being computed and the 25 per cent. paid in or not paid in, as it was not, the balance was divided among the stockholders; and I will assume that every stockholder was a widow, and that every other stockholder, to use a phrase which is exuberant, was an orphan and innocent, paid 200 per cent. to buy their stock, what of it?

"What right has a widow to wrong her creditors? What right has an orphan to wrong his creditors or her creditors? I do not understand it. I am in favor of the widow—not that I wish anybody's husband to die; I am in favor of orphans—not because I wish anybody's father or mother to die; but I do not quite understand on what principle it is that widows and orphans and all the other people who are supposed to be represented by Mr. Charles Francis Adams are entitled to be allowed by Congress to go on year by year as they are quite likely to do—and they have done it for many years—to take money that belongs to their creditors and put it in their own pockets."

Mr. Hoar, of Massachusetts, interrupting, said:

"The Senator said just now that if he made any misstatement he would be glad to be corrected, and I think he made unwittingly a misstatement in answer to the Senator from South Carolina, who asked if all above 25 per cent. now passed into the pockets of the stockholders, and the Senator said yes; and also when he stated—though he stated the fact with literal correctness—that there was a dividend year after year when they did not pay what was due. There has not been a dividend paid to the stockholders for several years. All the earnings have gone into the improvement of the property."

Mr. Edmunds continued:

"I did say that the 75 per cent. went into the pockets of the stockholders. Very likely I was incorrect about that, for a good many of the net earnings of corporations that are net earnings do not quite get into the pockets of the stockholders. It may be that I overstated that a little. I am not sure that it all went into the stockholders' pockets, but it was net earnings all the same.

"Year after year, I repeat, after the passage of the Thurman act, the Union Pacific Railroad Company did not obey it, and proceeded to declare dividends when the statutes of the United States said if they did they should suffer punishment, and the Administration—a Republican one, too—in some way or other failed to bring

them to time, as I suppose this Congress is altogether likely to fail to do anything whatever, which is exactly what all these railroads want, and we shall go on again, year by year, without taking any single step in advance.

"At least three or four years ago the matter came to the knowledge of the Committee on the Judiciary that the Union Pacific was not obeying this statute, and had been for some one, two, three, four, five, or six years declaring and paying dividends; whether it paid all the 75 per cent. that was left or not, I do not know; and that committee was rather disposed, Republican though it was, to see if it was possible to have the laws of the United States obeyed by a great corporation, whose president was a very eminent man, and whose stockholders were widows and orphans. We made considerable of a stir on the subject in a quiet way, and the result was, without trying to do the almost impossible thing of getting the two Houses of Congress to do anything about it, that we got a little more than three quarters of a million of dollars paid into the Treasury, and it is there yet, I suppose, a part of the surplus or part of something. After that time it became to be a serious question whether it would be advisable for the directors of the Union Pacific Railroad Company to declare any more dividends.

"Now, what, since the time they stopped paying dividends, has become of the 75 per cent. clear net earnings, I confess I do not know. I assume that the directors have disposed of it, not having paid dividends, in some suitable and proper way. I have no suspicion to express, no inquiry to make. It is their affair, if they obey the law as far as it goes, what they did with the other 75 per cent.

"Why should not this corporation out of this net income of the aided part of its lines, and no other, do something more than appropriate 25 per cent. of the net earnings for the benefit of its creditors, and advance 15 per cent. to 40, leaving them still 60 either for dividends or for enterprises as they may please, and thus accumulate and not lose but save, to meet their inevitable obligations to become due in ten years, amounting to in round numbers \$200,000,000; or are they to be left free to dispose of this clear net balance of cash in such a way as they please, and let the beast—I will not say that other individual, because nobody in the Senate would know who I meant—'take the hindmost'?"

"My friend from Massachusetts says it would injure the credit of the company to be compelled to save its funds for the benefit of its creditors. That is not the way we understand it in the rural country where I live. We generally think that a man who saves his funds to pay his debts is rather benefiting his creditors, but it may be different in Massachusetts. I can not say."

The measure, as amended, passed the Senate without a division; the House non-concurred

in the Senate amendments and a conference committee was appointed. It reported, March 2, in favor of the bill as passed by the Senate, with the following amendment:

Strike out, in the first and second lines, the words "by and with the advice and consent of the Senate," and add to the first section as follows:

The term of office of said commissioners shall not extend beyond the beginning of the next session of the Senate. If the Senate shall be convened after the 4th day of March, 1887, and before the 1st of December in said year, and the duties of said commissioner shall not then be completed, the President shall, by and with the advice and consent of the Senate, appoint three commissioners who shall perform and complete the duties prescribed in this act within the time therein specified.

The President approved of the measure March 3.

Chinese Affairs.—Jan. 6, 1887, the Senate passed, without a division, a bill to provide for the execution of Article II of the treaty concluded between the United States of America and the Emperor of China, Nov. 17, 1880, and proclaimed Oct. 5, 1881. The bill passed the House Feb. 8, 1887, without a division, and the President approved of it February 28. The text of it is as follows:

Be it enacted, etc. That the importation of opium into any of the ports of the United States by any subject of the Emperor of China is hereby prohibited. Every person guilty of a violation of the preceding provision shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by a fine of not more than \$500 nor less than \$50, or by imprisonment for a period of not more than six months nor less than thirty days, or by both such fine and imprisonment, in the discretion of the court.

Sec. 2. That every package containing opium, either in whole or in part, imported into the United States by any subject of the Emperor of China, shall be deemed forfeited to the United States; and proceedings for the declaration and consequences of such forfeiture may be instituted in the courts of the United States as in other cases of the violation of the laws relating to other illegal importations.

Sec. 3. That no citizen of the United States shall import opium into any of the open ports of China, nor transport the same from one open port to any other open port, or buy or sell opium in any of such open ports of China, nor shall any vessel owned by citizens of the United States, or any vessel, whether foreign or otherwise, employed by any citizen of the United States, or owned by any citizen of the United States, either in whole or in part, and employed by persons not citizens of the United States, take or carry opium into any of such open ports of China, or transport the same from one open port to any other open port, or be engaged in any traffic therein between or in such open ports or any of them. Citizens of the United States offending against the provisions of this section shall be deemed guilty of a misdemeanor, and, upon conviction thereof, shall be punished by a fine not exceeding \$500 nor less than \$50, or by both such punishments, in the discretion of the court. The consular courts of the United States in China, concurrently with any district court of the United States in the district in which any offender may be found, shall have jurisdiction to hear, try, and determine all cases arising under the foregoing provisions of this section, subject to the general regulations provided by law. Every package of opium or package containing opium, either in whole or in part, brought, taken, or transported, trafficked, or dealt in contrary to the provisions of this section, shall be forfeited to the United States, for the benefit of the Emperor of China; and

such forfeiture, and the declaration and consequences thereof, shall be made, had, determined, and executed by the proper authorities of the United States, exercising judicial powers within the Empire of China.

The treaty provision which this measure is designed to carry out was doubtless intended not only as a protection for China, but as a protest against the policy of Great Britain in forcing into China the Indian opium raised under government monopoly. Mr. Cox, of North Carolina, said in explanation of it:

"This bill, Mr. Speaker, does not interfere between the citizens of the United States and other governments, except with reference to China. By a treaty which was ratified in 1881 it was agreed that in the open ports of China, certain designated ports, they should not permit opium to be carried there by citizens of the United States, nor to be brought here and sold by United States citizens to the subjects of China.

"It is well known that one of the greatest social evils, probably, prevailing in China is the traffic in opium. By the treaty of 1841, made by Mr. Reed, it was restricted, and citizens of the United States in China violating the provisions of that treaty were punishable under the laws of China. The Burlingame treaty made no provision in reference to the subject, but there is a treaty which regulates the mode and method of punishment of United States citizens who reside in China and engage in this traffic. Now they are punishable under the laws of the United States, and this is expressly to prevent citizens of the United States in China from engaging in the traffic.

"By the treaty of 1844 there are five open ports provided for in China, and in these open ports the citizens of the United States have the right to obtain houses and places of business, etc. By the treaty of 1858, the number of these ports was increased, with the power to the citizens of the United States who may be there to reside with their families in the same, and to trade, and proceed from one port to another on business and pleasure. They shall not, however, use the privilege thus accorded them to carry on a clandestine or illegal trade along the coast, under such pains and penalties as may be prescribed by law. The treaty concluded November, 1880, contains the article which I will send to the Clerk's desk to be read."

The Clerk read as follows:

ARTICLE II. The Governments of China and of the United States mutually agree and undertake that Chinese subjects shall not be permitted to import opium into any of the ports of the United States; and citizens of the United States shall not be permitted to import opium into any of the open ports of China; to transport it from one open port to any other open port; or to buy and sell opium in any of the open ports of China. This absolute prohibition, which extends to vessels owned by the citizens or subjects of either power, to foreign vessels employed by them, or to vessels owned by the citizens or subjects of either power and employed by other persons for the transportation of opium, shall be enforced by appropriate legislation on the part of China and the United

States; and the benefits of the favored-nation clause in existing treaties shall not be claimed by the citizens or subjects of either power as against the provisions of this article.

"The President of the United States in May last communicated to Congress in special message the necessity for some legislation to carry into effect the provisions of this article. There are provisions in this treaty affecting our citizens in China which are provided for under this bill. A recent case has been called to the attention of the State Department by United States minister at Peking concerning the right of an American citizen to lease to a British merchant a portion of his house for the opium business. The manifest intent of this treaty is to prevent American citizens in China from engaging in this opium-traffic, or in knowingly aiding others to do so. The treaty itself is not self-executing. Appropriate legislation is required to make it effective. The passage of this bill, it is believed, will accomplish the purpose, and if no gentleman desires to be heard on the subject, and no further explanation is required, I ask that it may be put upon its passage."

At the first session of this Congress, the Senate passed a bill to indemnify certain subjects of the Chinese Empire for losses sustained by the violence of a mob at Rock Springs, in the Territory of Wyoming, in September, 1885. The measure provided for the appointment of a commission to investigate the actual loss and damage, and report the testimony taken, and the findings, to the Secretary of State, the President being empowered to apportion to each person a just compensation for the injuries sustained, the aggregate sum so apportioned not to exceed \$150,000, to be paid over to the Chinese minister at Washington, in full satisfaction of injuries inflicted upon the subjects of the empire. The House substituted for this measure the following, which was passed Feb. 8, 1887:

Be it enacted, etc., That the sum of \$147,748.74 be, and the same is hereby, appropriated, out of any moneys in the Treasury not otherwise appropriated, to be paid to the Chinese Government, in consideration of the losses unhappily sustained by certain Chinese subjects by mob violence at Rock Springs, in the Territory of Wyoming, Sept. 2, 1885; the said sum being intended for distribution among the sufferers and their legal representatives, in the discretion of the Chinese Government.

The President approved of this measure February 28.

Redemption of Trade-Dollars.—The old question in regard to the redemption of trade-dollars was settled in this session of Congress. Dec. 17, 1886, the Senate passed a bill providing for the redemption of these coins. Feb. 12, 1887, the House adopted and passed a substitute for this measure; and the Senate non-concurred in the House amendments. The main difference of opinion was, as to whether the redeemed trade-dollars should be regarded as part of the bullion to be purchased and coined under the act of Feb. 28, 1878. A

conference committee was appointed, and recommended the following measure as a substitute:

"That for a period of six months after the passage of this act, United States trade-dollars, if not defaced, mutilated or stamped, shall be received at the office of the Treasurer or any assistant treasurer of the United States in exchange for a like amount, dollar for dollar, of standard silver dollars or of subsidiary coins of the United States.

"Sec. 2. That the trade-dollars received by, paid to, or deposited with the Treasurer or any assistant treasurer or national depository of the United States, shall not be paid out or in any other manner issued, but, at the expense of the United States, shall be transmitted to the coinage mints, and recoined into standard silver dollars or subsidiary coin, at the discretion of the Secretary of the Treasury: *Provided*, That the trade-dollars recoined under this act shall not be counted as part of the silver bullion required to be purchased and coined into standard dollars as required by the act of Feb. 28, 1878."

February 19, both Senate and House agreed to the report of the conference committee, and the measure became a law without the approval of the President. In recommending the passage of this bill, Senator Beck, of Kentucky, introduced a statement of the merits of the question, from Dexter A. Hawkins, the following passages of which give a summary of the history and claims of the trade-dollars:

By Chapter CXXXI of the laws of 1873, page 424, Congress enacted as follows: "Sec. 15. That the silver coins of the United States shall be a trade-dollar, a half-dollar or fifty-cent piece, a quarter-dollar or twenty-five-cent piece, a dime or ten-cent piece, and said coins shall be legal tender at their nominal value for any amount not exceeding \$5 in any one payment." The act of which this is a part was approved by the President, and became a law of the United States, Feb. 12, 1873. There is not a word in the statute to indicate any other or different use than that of the fifty-cent, twenty-five-cent, and ten-cent silver coins; hence the statement often made that they were coined only for export has no justification in the statute."

"Under said section 15 of said act, the United States Mint, between July 12, 1873, and Aug. 1, 1876, coined 15,631,000 of these trade-dollars. Every one of these 15,631,000 trade-dollars was 'a legal tender for any amount not exceeding \$5 in any one payment,' and, like the small silver coins described in section 15, could be used to the extent of not exceeding \$5 as a legal tender in any payment, public or private, in the United States."

"Under the act of 1873 the coinage of trade-dollars was, like the coinage of gold and the coinage of the standard dollar before said act, free and unlimited. Anybody was at liberty to bring to the mint any amount of silver bullion, and, on paying the coinage charge, have it, like gold bullion, coined into trade-dollars, and delivered to him for use as lawful money. If the Government can honestly repudiate these trade-dollars, it can repudiate every coin it issues.

"No statute has ever been enacted that in terms or by just implication takes away from the 15,631,000 trade-dollars coined before August, 1876, the legal-tender quality given to them by said section 15 of the act of July 12, 1873.

"But what has been done as to the trade-dollar, is, that on July 22, 1876, after said 15,631,000 trade-dollars had been coined and issued, Congress passed a joint resolution, the second section of which is as follows: 'Sec. 2. That the trade-dollar shall not hereafter be a legal tender, and the Secretary of the Treasury is hereby authorized to limit from time to time

the coinage thereof to such an amount as he may deem sufficient to meet the export demand for the same.'

"This is a joint resolution, not a statute. It in terms, though awkwardly, seems to limit itself to the hereafter-issued trade-dollars, not the theretofore-issued trade-dollars. If the intention of the resolution was to repudiate the trade-dollars theretofore issued, to demonetize them, and to reduce them from money with limited legal-tender quality to merchandise with no legal-tender quality whatever, it would have omitted the word 'hereafter.' The word 'hereafter' has no proper function or meaning in the resolution, except to indicate that Congress did not intend to affect or to change anything already done, or the trade-dollar already issued. When this section was inserted by the Senate, had any Senator suggested that it would cause repudiation, the Senate would probably have either withdrawn it, or so modified it as to preclude such a construction.

"The plain intention of the resolution of July 22, 1876, was that none should be coined after that date except for export. But right here the Government failed of its duty to the people. It paid no attention to the last clause of the resolution as to coining only for export, but let unlimited coinage of trade-dollars go on for fifteen months, or until October, 1877. From July, 1876, to and including October, 1877, it coined \$15,079,400. This is as nearly as many as in the previous three years and five months.

"Then it did not stop the coinage. All it did was, on Oct. 15, 1877, to order at the Philadelphia Mint and the New York Assay-Office, and four days later at the other mints, 'That the receipt of deposits for silver for coinage into trade-dollars should be discontinued.'

"But twenty days later, Nov. 5, 1877, this order was modified so as 'to authorize deposits of silver bullion at the mint in San Francisco for returns in trade-dollars.'

"Under this modification, unlimited coinage of trade-dollars went on for seven months more, until May, 1878, when for the first time the coinage was actually and finally stopped. During this seven months 5,248,960 more trade-dollars were coined, making a total of 85,950,860.

"The official returns of exports of trade-dollars from the beginning of their coinage up to Oct. 31, 1879, show \$27,089,817; and according to the statement of experts these no longer exist, but have in the Asiatic countries to which they were exported, been converted into their coin. (See statement of Director of Mint, 1879.) This would leave in this country \$8,869,548, but the bullion dealers say that at least \$2,000,000 have been melted up in this country for manufacturing purposes. That would leave about \$7,000,000 still in existence. Of this \$7,000,000 all that bear date previous to 1877 were legal-tender coin in this country, and common honesty and the practice of nations require the Government to redeem them. It must either do that or repudiate."

Land-Grant Railroads.—Feb. 28, 1887, the Senate took up the House bill to provide for the adjustment of land-grants made by Congress to aid in the construction of railroads within the State of Kansas, and for the forfeiture of unearned lands and for other purposes, and passed it with amendments, making also a change in its title. The result was a conference committee, which agreed upon the following measure:

SECTION 1. That the Secretary of the Interior be, and is hereby, authorized and directed to immediately adjust in accordance with the decisions of the Supreme Court each of the railroad land-grants made by Congress to aid in the construction of railroads and heretofore unadjusted.

Sec. 2. That if it shall appear, upon the completion of such adjustments respectively, or sooner, that lands have been, from any cause, heretofore erroneously certified or patented, by the United States, to or for the use or benefit of any company claiming by, through, or under grant from the United States, to aid in the construction of a railroad, it shall be the duty of the Secretary of the Interior to thereupon demand from such company a relinquishment or reconveyance to the United States of all such lands, whether within granted or indemnity limits; and if such company shall neglect or fail to so reconvey such lands to the United States within ninety days after the aforesaid demand shall have been made, it shall thereupon be the duty of the Attorney-General to commence and prosecute in the proper courts the necessary proceedings to cancel all patents, certification, or other evidence of title heretofore issued for such lands, and to restore the title thereof to the United States.

Sec. 3. That if, in the adjustment of said grants, it shall appear that the homestead or pre-emption entry of any *bona-fide* settler has been erroneously canceled on account of any railroad grant or the withdrawal of public lands from market, such settler, upon application, shall be reinstated in all his rights and allowed to perfect his entry by complying with the public-land laws: *Provided*, That he has not located another claim, or made an entry in lieu of the one so erroneously canceled: *And provided also*, That he did not voluntarily abandon such original entry: *And provided further*, That if any of said settlers do not renew their application to be reinstated within a reasonable time, to be fixed by the Secretary of the Interior, then all such unclaimed lands shall be disposed of under the public-land laws, with priority of right given to *bona-fide* purchasers of said unclaimed lands, if any, and if there be no such purchasers, then to *bona-fide* settlers residing thereon.

Sec. 4. That as to all lands, except those mentioned in the foregoing section, which have been so erroneously certified or patented as aforesaid and which have been sold by the grantee company to citizens of the United States, or to persons who have declared their intention to become such citizens, the person or persons so purchasing, in good faith, his heirs or assigns, shall be entitled to the land so purchased, upon making proof of the fact of such purchase at the proper land-office, within such time and under such rules as may be prescribed by the Secretary of the Interior, after the grants respectively shall have been adjusted; and patents of the United States shall issue therefor, and shall relate back to the date of the original certification or patenting; and the Secretary of the Interior, on behalf of the United States, shall demand payment from the company which has so disposed of such lands of an amount equal to the Government price of similar lands; and in case of neglect or refusal of such company to make payment as hereafter specified, within ninety days after the demand shall have been made, the Attorney-General shall cause suit or suits to be brought against such company for the said amount: *Provided*, That nothing in this act shall prevent any purchaser of lands erroneously withdrawn, certified, or patented as aforesaid from recovering the purchase-money therefor from the grantee company, less the amount paid to the United States by such company as by this act required: *And provided*, That a mortgage or pledge of said lands by the company shall not be considered as a sale for the purpose of this act, nor shall this act be construed as a declaration of forfeiture of any portion of any land-grant for conditions broken, or as authorizing an entry for the same, or as a waiver of any rights that the United States may have on account of any breach of said conditions.

Sec. 5. That where any said company shall have sold to citizens of the United States, or to persons who have declared their intention to become such citizens, as a part of its grant, lands not conveyed to or for the use of such company, said lands being the

numbered sections prescribed in the grant, and being contiguous with the constructed parts of said road, and where the lands so sold are for any reason excepted from the operation of the grant to said company, it shall be lawful for the *bona-fide* purchaser thereof from said company to make payment to the United States for said lands at the ordinary Government price for like lands, and thereupon patents shall issue therefor to the said *bona-fide* purchaser, his heirs or assigns: *Provided*, That all lands shall be excepted from the provisions of this section which at the date of such sales were in the *bona-fide* occupation of adverse claimants under the pre-emption or homestead laws of the United States, and whose claims and occupation have not since been voluntarily abandoned, as to which excepted lands the said pre-emption and homestead claimants shall be permitted to perfect their proofs and entries and receive patents therefor: *Provided further*, That this section shall not apply to lands settled upon subsequent to the 1st day of December, 1882, by persons claiming to enter the same under the settlement laws of the United States, as to which lands the parties claiming the same as aforesaid shall be entitled to prove up and enter as in other like cases.

Sec. 6. That where any lands have been sold and conveyed, as the property of any railroad company, for State and county taxes thereon, and the grant to such company has been thereafter forfeited, the purchaser thereof shall have the prior right, which shall continue for one year from the approval of this act, and no longer, to purchase such lands from the United States at the Government price, and patents for such lands shall thereupon issue: *Provided*, That said lands were not, previous to or at the time of the taking effect of such grant, in the possession of or subject to the right of any actual settler.

Sec. 7. That no more lands shall be certified or conveyed to any State or to any corporation or individual, for the benefit of either of the companies herein mentioned, where it shall appear to the Secretary of the Interior that such transfers may create an excess over the quantity of lands to which such State, corporation, or individual would be rightfully entitled.

Both Houses agreed to the report of the Conference Committee March 8, and the President approved of the measure the same day.

Congress passed and the President approved a bill "to declare a forfeiture of lands granted to the New Orleans, Baton Rouge, and Vicksburg Railroad Company, to confirm title to certain lands, and for other purposes." The real purpose of the measure was to confirm title to the New Orleans Pacific Railroad Company in lands originally granted to the first-named railroad company, never earned by that corporation, but claimed by the last-named railroad company as its assignee.

Congress passed and the President approved a bill "for the relief of settlers and purchasers of lands on the public domain in the States of Kansas and Nebraska." The measure provides for the reimbursement of persons who in good faith took up lands within the grant made in 1866 to the Northern Kansas Railroad and Telegraph, and who afterward were obliged to make payment to that corporation for their holdings.

Miscellaneous.—The following measure, regulating proceedings in contested-election cases in the House, was passed, and approved by the President, March 8, 1887:

Be it enacted, etc., That section 127 of the Revised Statutes of the United States be so amended as to read as follows:

All officers taking testimony to be used in a contested-election case, whether by deposition or otherwise, shall, when the taking of the same is completed, and without unnecessary delay, certify and carefully seal and immediately forward the same, by mail or by express, addressed to the Clerk of the House of Representatives of the United States, Washington, D. C.; and shall also indorse upon the envelope containing such deposition or testimony the name of the case in which it is taken, together with the name of the party in whose behalf it is taken, and shall subscribe such indorsement.

The Clerk of the House of Representatives, upon the receipt of such deposition or testimony, shall notify the contestant and the contestee, by registered letter through the mails, to appear before him at the Capitol, in person or by attorney, at a reasonable time to be named, not exceeding twenty days from the mailing of such letter, for the purpose of being present at the opening of the sealed packages of testimony and of agreeing upon the parts thereof to be printed. Upon the day appointed for such meeting the said Clerk shall proceed to open all the packages of testimony in the case, in the presence of the parties or their attorneys, and such portions of the testimony as the parties may agree to have printed shall be printed by the Public Printer, under the direction of the said Clerk, and in case of disagreement between the parties as to the printing of any portion of the testimony, the said Clerk shall determine whether such portion of the testimony shall be printed; and the said Clerk shall prepare a suitable index to be printed with the record. And the notice of contest and the answer of the sitting member shall also be printed with the record.

If either party, after having been duly notified, should fail to attend, by himself or by an attorney, the Clerk shall proceed to open the packages, and shall cause such portions of the testimony to be printed as he shall determine.

He shall carefully seal up and preserve the portions of the testimony not printed, as well as the other portions when returned from the Public Printer, and lay the same before the Committee on Elections at the earliest opportunity. As soon as the testimony in any case is printed, the Clerk shall forward by mail, if desired, two copies thereof to the contestant, and the same number to the contestee, and shall notify the contestant to file with the Clerk within thirty days a brief of the facts, and the authorities relied on to establish his case. The Clerk shall forward by mail two copies of the contestant's brief to the contestee with like notice.

Upon receipt of the contestee's brief the Clerk shall forward two copies thereof to the contestant, who may, if he desires, reply to new matter in the contestee's brief within like time. All briefs shall be printed at the expense of the parties respectively, and shall be of like folio as the printed record; and sixty copies thereof shall be filed with the Clerk for the use of the Committee on Elections.

The following measure, to amend the law relating to patents, trade-marks, and copyrights, was passed, and approved by the President, Feb. 4, 1887:

Be it enacted, etc., That hereafter, during the term of letters patent for a design, it shall be unlawful for any person other than the owner of said letters patent, without the license of such owner, to apply the design secured by such letters patent, or any colorable imitation thereof, to any article of manufacture for the purpose of sale, or to sell or expose for sale any article of manufacture to which such design or colorable imitation shall, without the license of the owner, have been applied, knowing that the same has been so ap-

plied. Any person violating the provisions, or either of them, of this section, shall be liable in the amount of \$250; and in case the total profit made by him from the manufacture or sale, as aforesaid, of the article or articles to which the design, or colorable imitation thereof, has been applied, exceeds the sum of \$250, he shall be further liable for the excess of such profit over and above the sum of \$250; and the full amount of such liability may be recovered by the owner of the letters patent, to his own use, in any circuit court of the United States having jurisdiction of the parties, either by action at law or upon a bill in equity for an injunction to restrain such infringement.

Sec. 2. That nothing in this act contained shall prevent, lessen, impeach, or avoid any remedy at law or in equity which any owner of letters patent for a design, aggrieved by the infringement of the same, might have had if this act had not been passed; but such owner shall not twice recover the profit made from the infringement.

Its scope was explained by Mr. Morton, of Alabama, as follows:

"A man making carpet, or oil-cloth, or wall-paper, or anything of that kind, goes to an artist and gets him to furnish a design which he thinks will captivate the eye and fancy of the purchaser. The moment he gets a patent for that design there must be left in the Patent-Office a lithograph of it; and that lithograph can be obtained by any one who wants it for a few cents. Those who infringe the patent purchase these lithographs of designs. They have a full description of the design and make an exact counterfeit, or imitation; so exact hardly any man can see the difference between them.

"There is a law allowing a man a patent for his design. He has now two remedies: action on the case for damage for use of it, and relief by injunction to prevent the manufacture of the goods. Both of them, I will say, are practically useless and futile as means to be employed for preventing infringement. A design only lives for a year; and how can you prevent a man making a carpet of a certain design without knowing he is engaged in making it? How do you know he is making it? It can not be known until the carpet is made and put upon the market. The remedy, when the carpet has been manufactured and put on the market, is by the action on the case. The patentee had another remedy by injunction. Every lawyer knows the remedy by injunction is a preventive remedy, and that in order to avail yourself of the benefit of it you must know of the contemplated injury in time to prevent the commission of it. So I say the remedy by injunction for a man who has a patent design amounts to nothing. What this bill seeks to correct is sufficient, of itself, to commend it to all men.

"We can not protect the man on his patent and in the possession of his patented rights unless we attach a penalty for the infringement of the same: and that is simply what the bill does."

The following bill, providing for the disposal of the famous Twiggs swords, was passed, and approved by the President March 8, 1887.

Be it enacted, etc., That the Secretary of the Treasury is hereby authorized and directed to deliver up the so-called "Twigg's swords," which are now in his custody, and which were captured or seized by General B. F. Butler, in 1862, to such person, or to the legal representatives of such person, as was owner thereof at the time they were captured or seized. For the purpose of determining who was such owner the Secretary of the Treasury shall send the petitions of all persons who may claim said swords to the Court of Claims. Said court shall thereupon examine such claimant or claimants, and such other legal evidence as may be offered in behalf of such claimant or claimants, and determine who was such owner and who is entitled to receive said swords under the provisions of this act. Said court shall certify their judgment to the Secretary of the Treasury: *Provided, however,* That all claims for said swords shall be filed with the Secretary of the Treasury within three months from the passage of this act.

Feb. 1, 1887, the following bill to effect a rearrangement of grades of office in the Adjutant-General's Department of the Army, passed the House without a division:

Be it enacted, etc., That the Adjutant-General's Department of the Army shall consist of one adjutant-general, with the rank, pay, and emoluments of brigadier-general; four assistant adjutants-general, with the rank, pay, and emoluments of colonel; six assistant adjutants-general, with the rank, pay, and emoluments of lieutenant-colonel; and six assistant adjutants-general, with the rank, pay, and emoluments of major: *Provided,* That the vacancies in the grade of colonel and lieutenant-colonel created by this act shall be filled by the promotion by seniority of the officers now in the Adjutant-General's Department.

Mr. Wheeler, of Alabama, said, in explanation of the measure:

"This bill I will state does not create any additional officers; it simply has the effect of increasing the rank of certain officers, already commissioned, in the Adjutant-General's Department.

"In all armies of the world the adjutant-general is the chief of staff, and generally has a rank higher than that of all other officers of the staff; but owing to the fact that in the United States Army promotion has been slower in the Adjutant-General's Department than in any other branch of the service, in nearly every case the Adjutant-General is inferior in rank to all the other officers of the staff of the commanding officer. Another reason for this is that it not infrequently happens that a junior officer is giving orders to a superior; and in addition the officer whose dignity and position is highest is compelled to accept a junior place in selecting quarters, and in all of the other emoluments conferred upon officers of the Army.

"The report in this case shows that the four officers who will be promoted to lieutenant-colonel from major have held the office of major for periods ranging from eighteen to twenty years."

The Senate passed the bill February 23, and the President approved of it February 28.

Congress passed and the President approved a bill for the allotment of land in severalty to Indians. The first two sections are as follows:

That in all cases where any tribe or band of Indians has been, or shall hereafter be, located upon any reservation created for their use, either by treaty stipulation or by virtue of an act of Congress or executive order setting apart the same for their use, the President of the United States be, and he hereby is, authorized, whenever in his opinion any reservation or any part thereof of such Indians is advantageous for agricultural and grazing purposes, to cause said reservation, or any part thereof, to be surveyed, or resurveyed if necessary, and to allot the lands in said reservation in severalty to any Indian located thereon, in quantities as follows:

"To each head of a family, one quarter of a section;

"To each single person over eighteen years of age, one eighth of a section;

"To each orphan child under eighteen years of age, one eighth section; and

"To each other single person under eighteen years now living, or who may be born prior to the date of the order of the President directing an allotment of the lands embraced in any reservation, one sixteenth of a section: *Provided,* That in case there is not sufficient land in any of said reservations to allot lands to each individual of the classes above named in quantities as above provided, the lands embraced in such reservation or reservations shall be allotted to each individual of each of said classes pro rata in accordance with the provisions of this act: *And provided further,* That where the treaty or act of Congress setting apart such reservation provides for the allotment of lands in severalty in quantities in excess of those herein provided, the President, in making allotments upon such reservation, shall allot the lands to each individual Indian belonging thereon in quantity as specified in such treaty or act: *And provided further,* That when the lands allotted are only valuable for grazing purposes, an additional allotment of such grazing-lands, in quantities as above provided, shall be made to each individual."

Sec. 2. That all allotments set apart under the provisions of this act shall be selected by the Indians, heads of families selecting for their minor children, and the agents shall select for each orphan child, and in such manner as to embrace the improvements of the Indians making the selection. Where the improvements of two or more Indians have been made on the same legal subdivision of land, unless they shall otherwise agree, a provisional line may be run dividing said lands between them, and the amount to which each is entitled shall be equalized in the assignment of the remainder of the land to which they are entitled under this act: *Provided,* That if any one entitled to an allotment shall fail to make a selection within four years after the President shall direct that allotments may be made on a particular reservation, the Secretary of the Interior may direct the agent of such tribe or band, if such there be, and if there be no agent, then a special agent appointed for that purpose, to make a selection for such Indian, which selection shall be allotted as in cases where selections are made by the Indians, and patents shall issue in like manner.

The other sections provide that the allotments shall be made by agents appointed by the President, for modes of procedure, for holding allotted lands in trust and issuing of patents, for allotments to Indians not on reservations. It also limits the application of the law, excluding certain tribes.

Dec. 15, 1886, the House passed a bill to amend sections 5191 and 5192 of the Revised Statutes which regulate the reserve to be held in the national banks of certain cities. March 8, 1887, the Senate amended and passed the measure; the House non-concurred; a Confer-

ence Committee was appointed, and reported the following, which both Houses agreed to :

That whenever three fourths in number of the national banks located in any city of the United States having a population of 50,000 people shall make application to the Comptroller of the Currency, in writing, asking that the name of the city in which such banks are located shall be added to the cities named in sections 5191 and 5193 of the Revised Statutes, the Comptroller shall have authority to grant such request, and every bank located in such city shall at all times thereafter have on hand, in lawful money of the United States, an amount equal to at least 95 per cent. of its deposits, as provided in sections 5191 and 5195 of the Revised Statutes.

Sec. 2. That whenever three fourths in number of the national banks located in any city of the United States having a population of 200,000 people shall make application to the Comptroller of the Currency, in writing, asking that such city may be a central reserve city, like the city of New York, in which one half of the lawful money reserve of the national banks located in other reserve cities may be deposited, as provided in section 5195 of the Revised Statutes, the Comptroller shall have authority, with the approval of the Secretary of the Treasury, to grant such request, and every bank located in such city shall at all times thereafter have on hand, in lawful money of the United States, 95 per cent. of its deposits, as provided in section 5191 of the Revised Statutes.

Sec. 3. That section 3 of the act of January 14, 1875, entitled "An act to provide for the resumption of specie payment," be, and the same is hereby, amended by adding, after the words "New York," the words, "and the city of San Francisco, Cal."

The measure was approved by the President March 3.

A bill was passed to enable the Commissioner of Agriculture to make a special distribution of seeds in the drought-stricken districts of Texas, and making an appropriation for that purpose; but the President vetoed the measure, saying:

I can find no warrant for such an appropriation in the Constitution; and I do not believe that the power and duty of the General Government ought to be extended to the relief of individual suffering which is in no manner properly related to the public service or benefit. A prevalent tendency to disregard the limited mission of this power and duty should, I think, be steadfastly resisted, to the end that the lesson should be constantly enforced that, though the people support the Government, the Government should not support the people.

The friendliness and charity of our countrymen can always be relied upon to relieve their fellow-citizens in misfortune. This has been repeatedly and quite lately demonstrated. Federal aid in such cases encourages the expectation of paternal care on the part of the Government and weakens the sturdiness of our national character, while it prevents the indulgence among our people of that kindly sentiment and conduct which strengthens the bonds of a common brotherhood.

The measure to restrict ownership of real estate in the Territories to American citizens was passed by Congress and approved by the President in this form:

That it shall be unlawful for any person or persons not citizens of the United States, or who have not lawfully declared their intention to become such citizens, or for any corporation not created by or under the laws of the United States or of some State or Territory of the United States, to hereafter acquire, hold, or own real estate so hereafter acquired, or any interest

therein, in any of the Territories of the United States or in the District of Columbia, except such as may be acquired by inheritance or in good faith in the ordinary course of justice in the collection of debts heretofore created: *Provided*, That the prohibition of this section shall not apply to cases in which the right to hold or dispose of lands in the United States is secured by existing treaties to the citizens or subjects of foreign countries, which rights so far as they may exist by force of any such treaty, shall continue to exist so long as such treaties are in force, and no longer.

Sec. 2. That no corporation or association, more than 20 per cent. of the stock of which is or may be owned by any person or persons, corporation or corporations, association or associations, not citizens of the United States, shall hereafter acquire or hold or own any real estate hereafter acquired in any of the Territories of the United States or of the District of Columbia.

Sec. 3. That no corporation other than those organized for the construction or operation of railways, canals, or turnpikes shall acquire, hold, or own more than 5,000 acres of land in any of the Territories of the United States; and no railroad, canal, or turnpike corporation shall hereafter acquire, hold, or own lands in any Territory, other than as may be necessary for the proper operation of its railroad, canal, or turnpike, except such lands as may have been granted to it by act of Congress; but the prohibition of this section shall not affect the title to any lands now lawfully held by any such corporation.

Sec. 4. That all property acquired, held, or owned in violation of the provisions of this act shall be forfeited to the United States, and it shall be the duty of the Attorney-General to enforce every such forfeiture by bill in equity or other proper process. And in any suit or proceeding that may be commenced to enforce the provisions of this act, it shall be the duty of the court to determine the very right of the matter, without regard to matters of form, joinder of parties, multifariousness, or other matters not affecting the substantial rights either of the United States or of the parties concerned in any such proceeding arising out of the matters in this act mentioned.

There was passed by Congress, and approved by the President, a bill "to prohibit any officer, agent, or servant of the Government of the United States to hire or contract out the labor of prisoners incarcerated for violating the laws of the Government of the United States." It declares that it shall not be lawful for any officer, agent, or servant of the Government of the United States to contract with any person or corporation, or permit any warden, agent, or official of any State prison, penitentiary, jail, or house of correction where criminals of the United States may be incarcerated, to hire or contract out the labor of said criminals, or any part of them, who may hereafter be confined in any prison, jail, or other place of incarceration for violation of any laws of the Government of the United States of America.

A bill was passed by Congress and approved by the President, extending the free-delivery system to cities of over 10,000 inhabitants, according to the last general census taken by State or United States law, or to offices that had during the previous fiscal year a gross revenue of not less than \$10,000. It also divided letter-carriers in cities of more than 75,000 inhabitants and over into three classes, members of the first to receive a salary of \$1,000, members of the second a salary of

\$800, and the members of the third a salary of \$600. In cities of less than 75,000 population, it divided the letter-carriers into two classes, those of the one class to receive a salary of \$800, and those of the other a salary of \$600.

Foreign Contract Labor.—A bill was passed by Congress and approved by the President, which added to the act to prohibit the importation and immigration of foreigners and aliens under contract or agreement to perform labor in the United States, its Territories, and the District of Columbia, approved Feb. 26, 1885, and to provide for the enforcement thereof, the following sections:

SEC. 6. That the Secretary of the Treasury is hereby charged with the duty of executing the provisions of this act; and for that purpose he shall have power to enter into contracts with such State commission, board, or officers as may be designated for that purpose by the Governor of any State to take charge of the local affairs of immigration in the ports within said State, under the rules and regulations to be prescribed by said Secretary; and it shall be the duty of such State commission, board or officers so designated to examine into the condition of passengers arriving at the ports within such State in any ship or vessel; and for that purpose all or any of such commissioners or officers, or such other person or persons as they shall appoint, shall be authorized to go on board of and through any such ship or vessel; and if in such examination there shall be found among such passengers any person included in the prohibition in this act, they shall report the same in writing to the collector of such port, and such persons shall be permitted to land.

SEC. 7. That the Secretary of the Treasury shall establish such regulations and rules, and issue from time to time such instructions, not inconsistent with law, as he shall deem best calculated for carrying out the provisions of this act; and he shall prescribe all forms of bonds, entries, and other papers to be used under and in the enforcement of the various provisions of this act.

SEC. 8. That all persons included in the prohibition in this act, upon arrival, shall be sent back to the nations to which they belong and from whence they came. The Secretary of the Treasury may designate the State Board of Charities of any State in which such board shall exist by law, or any commission in any State, or any person or persons in any State, whose duty it shall be to execute the provisions of this section, and shall be entitled to reasonable compensation therefor, to be fixed by regulation prescribed by the Secretary of the Treasury. The Secretary of the Treasury shall prescribe regulations for the return of the aforesaid persons to the countries from whence they came, and shall furnish instructions to the board, commission, or persons charged with the execution of the provisions of this section as to the time of procedure in respect thereto, and may change such instructions from time to time. The expense of such return of the aforesaid persons not permitted to land shall be borne by the owners of the vessels in which they came; and any vessel refusing to pay such expenses shall not thereafter be permitted to land at or clear from any port of the United States, and such expenses shall be a lien on said vessel. That the necessary expense in the execution of this act for the present fiscal year shall be paid out of any money in the Treasury not otherwise appropriated.

SEC. 9. That all acts and parts of acts inconsistent with this act are hereby repealed.

SEC. 10. That this act shall take effect at the expiration of thirty days after its passage.

In addition to the bills already noticed, those relating to appropriations and those giving pen-

sions and relief to individuals, bills were passed as follows:

Providing for the erection of public buildings at Eastport, Me., Springfield, Mass., Worcester, Mass., Binghamton, N. Y., Camden, N. J., Wilmington, N. C., Charleston, S. C., Huntsville, Ala., Detroit, Mich., Owensborough, Ky., Chattanooga, Tenn., Houston, Tex., Fort Scott, Kan., San Francisco, Cal., and Los Angeles, Cal.; also increasing the appropriations for the public buildings at Brooklyn, N. Y., and Troy, N. Y., and authorizing the exchange of the property purchased at Abingdon, Va., as a site for a public building, for more suitable property.

Authorizing the construction of bridges as follows: Across the East River between the city of New York and Long Island; across the Great Kanawha River below the Falls; across the Eastern Branch of the Potomac River at the foot of Pennsylvania Avenue East; across the Tradewater River by the Ohio Valley Railroad Company; across the Coosa River by the East and West Railroad Company of Alabama, and across the same river by the Talladega and Coosa Valley Railroad Company of Alabama; across the Sunflower, Yazoo, and Tombigbee Rivers in Mississippi by the Georgia Pacific Railroad Company; across the Tombigbee River at or near Columbus, Miss., by the Tombigbee Railroad Company; across the Red River in Louisiana by the Louisiana North and South Railroad Company; across the Tennessee River at or near Sheffield, Ala., at or near Gunterville, Ala., at or near Chattanooga, Tenn., and at or near the foot of Muscle Shoals Canal; across the Cumberland River, by the county of Davidson, Tenn.; across the Red River of the North; across the St. Louis River at the most accessible point between the States of Minnesota and Wisconsin; across a part of the Mississippi and a certain island therein by the city of Winona, Minn.; across the Mississippi River at Fort Madison or Keokuk or between those points, at Grand Tower, Ill.; between East Dubuque, Ill., and Dubuque, Ia., and at St. Louis, Mo.; across the Missouri River between Omaha, Neb., and Council Bluffs, Ia., within five miles of Yankton, Dak., at Pierre, Dak., by the Duluth, Pierre, and Black Hills Railroad Company, and at the most accessible point between the city of Kansas and the town of Sibley, Mo.; and across Bayou Bernard, in Mississippi.

Granting right of way to railroads as follows: To the Annapolis and Baltimore Short Line Railroad Company across the Government farm connected with the Naval Academy at Annapolis, Md.; to the Ohio Central Railroad Company through United States lock and dam property in the Great Kanawha Valley, W. Va.; to the Chicago, Kansas, and Nebraska Railway through the Indian Territory; to the Fort Worth and Denver City Railroad Company through the Indian Territory; to the Fremont, Elk Horn, and Missouri Valley Railroad across the Fort Meade military reservation; to the Prescott and Arizona Central Railway Company across the Fort Whipple military reservation in Arizona; to the Maricopa and Phoenix Railway Company of Arizona through the Gila River Indian reservation; to the Utah Midland Railway Company through the Uncompahgre and Uintah reservations in the Territory of Utah; through certain public lands in the Territory of Utah, etc.; to the Rocky Fork and Cooke City Railway Company through a part of the Crow Indian Reservation in Montana Territory; and to the St. Paul, Minneapolis, and Manitoba Railway Company through the Indian reservations in Northern Montana and Northwestern Dakota.

To make Tampa, Fla., a port of entry and Hartford, Conn., in place of Middletown.

To provide for holding terms of United States courts at Vicksburg, Miss., and at Texarkana, Ark.; at Wilmington, N. C.; of the Circuit Court for the Eastern Judicial District of North Carolina; of the Circuit and District Courts of the United States for the Eastern District of Michigan at Bay City; pro-

viding an additional circuit judge in the second judicial circuit; to amend section 586 of the Revised Statutes of the United States relating to the division of the State of Illinois into judicial districts, and to provide for holding terms of court of the Northern District at Peoria; and to amend the act dividing the State of Missouri into two judicial districts, and to divide the eastern and western districts thereof into divisions, establish district and circuit courts of the United States therein, and provide for the times and places for holding such courts, and for other purposes.

For the relief of the sufferers by the wreck of the United States vessel Ashuelot.

For the construction of a military telegraph line from Sanford, Fla., to Point Jupiter, Fla., and the establishment of a signal-station.

To provide for the settlement of an account with the Vicksburg and Meridian Railroad Company for internal-revenue tax, and to refund the amount of said tax erroneously assessed and collected.

To establish agricultural experiment stations in connection with the colleges established in the several States under the provisions of an act approved July 2, 1862, and of the acts supplementary thereto.

To provide a school of instruction for cavalry and light artillery, and for the construction and completion of quarters, barracks, and stables at certain posts for the use of the Army of the United States.

To provide for the location and erection of a branch home for disabled volunteer soldiers west of the Rocky Mountains.

Making an appropriation for the establishment and erection of a military post near the city of Denver, in the State of Colorado.

To repeal certain provisions of the act approved March 3, 1875, relating to the purchase of arms for the use of the States.

For the relief of graduates of the United States Military Academy.

To amend an act entitled "An act to provide for the muster and pay of certain officers and enlisted men of the volunteer forces," approved June 8, 1884.

Authorizing the Secretary of War to accept certain lands, etc., near Chicago, Ill.

To amend the act entitled "An act to modify the postal money-order system, and for other purposes," approved March 3, 1883.

For the relief of the survivors of the exploring steamer "Jeannette," and the widows and children of those who perished in the retreat from the wreck of that vessel in the Arctic seas.

To grant certain seal-rocks to the city and county of San Francisco, State of California, in trust for the people of the United States.

To provide for the redemption and sale of the school-farm lands now held in Beaufort County, South Carolina, by the United States.

To provide for the appointment of hospital stewards in the United States Army, and to fix their pay and allowance.

Authorizing the employment of mail-messengers in the postal service.

To amend an act entitled "An act to amend the statutes in relation to the immediate transportation of dutiable goods, and for other purposes," approved June 10, 1880.

To provide for the adjustment of matters connected with certain judicial proceedings in Pennsylvania in which the United States was a party.

To amend the third section of an act entitled "An act to provide for the sale of the Sac and Fox and Iowa Indian reservations, in the States of Nebraska and Kansas, and for other purposes," approved March 3, 1885.

To authorize the city of Newport, R. I., to use the site of Fort Greene as a public park.

To release unto the city of San Antonio, Tex., for its use as a public thoroughfare, certain portions of the military reservation near said city.

To authorize the Secretary of War to improve and enlarge the barracks at Newport, Ky.

To convey to and confirm in the city of Aurora, in the county of Kane and State of Illinois, a small island in Fox River, located within the limits of said city.

To provide for the settlement of accounts with the Mobile and Ohio Railroad Company.

To define the boundaries of the collection districts of Miami and Sandusky, in the State of Ohio.

To authorize the Secretary of War to credit the Territory of Dakota with certain sums for ordnance and ordnance-stores issued to said Territory, and for other purposes.

Relating to the importing and landing of mackerel caught during the spawning-season.

For the allowance of certain claims reported by the accounting officers of the United States Treasury Department.

To amend section 1661 of the Revised Statutes, making an annual appropriation to provide arms and equipments for the militia.

To amend an act in relation to the immediate transportation of dutiable goods, and for other purposes, approved June 10, 1880.

To amend section 583 of the Revised Statutes of the United States.

To repeal certain sections of the Revised Statutes of the United States relating to the appointment of civil officers.

Providing for the sale of public documents.

To provide for grading and paving the approaches to the national cemetery near Danville, Va.

For the repair and preservation of the road, heretofore constructed by the Government, leading from Vicksburg to the national cemetery adjacent thereto.

To authorize the construction of a graveled road to the Richmond national cemetery, near Richmond, Va.

To authorize Frank W. Hunt to maintain a ferry across the Missouri River at the military reservation of Fort Buford, Dakota.

For the construction of a stable for the use of the horses and wagons for the use of the officers of the House of Representatives.

Extending the charter of "The President and Directors of the Firemen's Insurance Company of Washington and Georgetown," in the District of Columbia.

To regulate insurance in the District of Columbia.

For the further protection of property from fire, and safety of lives, in the District of Columbia.

To enable foreign executors and administrators to sue in the District of Columbia, and for other purposes.

For the relief of St. Dominic's Church, in the District of Columbia.

To authorize the Commissioners of the District of Columbia to permit the temporary occupation of streets by a railway for the purpose of transporting material to fill about the base of the Washington Monument.

To regulate steam-engineering in the District of Columbia.

To regulate the construction and operation of elevators within the District of Columbia, and for other purposes.

To quiet title to certain land in the city of Washington, D. C.

Relating to arrears of taxes in the District of Columbia.

Authorizing the Treasurer of the United States to credit the District of Columbia with certain moneys in lieu of investing the same in bonds.

CONNECTICUT. State Government.—The following were the State officers during the year: Governor, Phineas C. Lounsbury, Republican; Lieutenant-Governor, James L. Howard; Secretary of State, L. M. Hubbard; Treasurer, Alexander Warner; Comptroller, Thomas Clark; Secretary of State Board of Education, Charles D. Hine; Railroad Commissioners,

George M. Woodruff, W. H. Haywood, John W. Bacon succeeded by William O. Seymour; Chief Justice of Supreme Court, John D. Parks; Associate Justices, Elisha Carpenter, Dwight W. Pardee, Dwight Loomis, Miles T. Granger succeeded by Sidney B. Beardale. The first five officers were elected by the Legislature in January, there being no choice by the people in the election of 1886.

Legislative Session.—The session of this year was the first under the biennial system established by a recent amendment to the constitution. It continued from January 5 till May 15. United States Senator Joseph R. Hawley, Republican, was re-elected early in the session by a vote of 128 to 98 for Charles R. Ingersoll, Democrat. The refunding of a part of the public debt was accomplished by an act authorizing the redemption of \$1,080,000 of bonds issued in 1877 and bearing 5 per cent. interest on or before the 1st of August of this year. To enable the treasurer to do this, he was empowered to issue new bonds to the amount of \$1,000,000 bearing 3½ per cent. interest from May 2, and payable May 1, 1897. The remaining \$80,000 of bonds were to be paid out of funds already in the treasury. The new bonds were made exempt from taxation. Under this law the State treasurer, by advertising for bids, was able to sell the new bonds in June at a premium, one half of them at 108-27 and one half at 102-55.

The State tax for 1886 was 2 mills on the dollar, an increase over former years necessitated by extraordinary expenses for building new armories, and for the enlargement and improvement of the State prison. No such expenses being required for 1887 and 1888, the Legislature restored the former rate of 1½ mills on the dollar.

The following resolutions were passed by the lower house:

Resolved, That the following be proposed as an amendment to the constitution of the State, which, when approved and adopted in the manner provided by the constitution, shall to all intents and purposes become a part thereof, viz.: The manufacture or compounding of, and sale or keeping for sale of, intoxicating liquors, excepting for sacramental, medicinal, scientific, mechanical, and art purposes, shall be and hereby are prohibited in this State; and it shall be the duty of the Legislature to pass laws for the enforcement of this article.

Resolved, that the foregoing proposed amendment to the constitution be continued to the next general assembly, and be published with the laws passed at the present session.

The principal sums voted for specific objects were, for the Statute Revision Commission, \$18,000; for the Industrial School for Girls, \$10,000; State Reform School, \$30,500; for preserving the record of the Connecticut Volunteers, \$25,000; Danbury Hospital, \$6,000; Waterbury Hospital, \$25,000; Fitch's Soldiers' Home, for the purchase of land, \$8,000; School for Imbeciles, \$5,000.

Other acts of the session were as follow:

To subject trust and investment companies to the supervision of the bank commissioners.

To punish false pretenses in obtaining the registration of cattle and other animals, and to punish giving false pedigrees.

Restricting railroad traffic on Sunday to cases of necessity or mercy, and providing that the highest regular fare shall be charged on that day; season, mileage, or commutation tickets not being receivable.

To punish desertions by husbands.

Raising the age of consent in females from ten to fourteen years.

To procure enforcement of the law requiring the attendance of children at school.

Regulating the rights and duties of electric companies, in placing their wires in public highways.

To punish blackmail.

Providing that no person shall practice dentistry unless he has a diploma from some duly authorized dental college; or has had eighteen months' experience in a dental office and attended a course of lectures; or, if from another State, a certificate from a board of dental examiners, or six years' practice.

To prevent discrimination by life-insurance companies against persons of color.

Prohibiting and punishing the employment of women or children under sixteen years of age more than ten hours a day in any manufacturing, mercantile, or mechanical establishment.

Providing for weekly payments of wages.

Enabling the agents of the Connecticut Humane Society to take charge of and care for animals neglected, abandoned, or cruelly treated, and to destroy diseased, disabled, or useless animals.

Providing that imitation butter shall not be sold or used unless the fact of such sale or use is plainly stated on a printed notice posted at the place of sale or use; that it shall only be sold in packages labeled to show the fact of such imitation, and appointing and creating a dairy commissioner to enforce these provisions.

To prevent the sale of liquors at agricultural fairs.

To regulate the sale of medicines and poisons.

Imposing a tax on the net earnings of any registered or enrolled sailing-vessel.

Revising the law regarding collection of taxes.

Providing for the punishment of incorrigible criminals.

To establish free public highways across the Connecticut river in Hartford County.

Requiring insurance agents to obtain a license from the insurance commissioner.

Enabling women to be eligible to any office connected with the management of the public schools.

Adopting the revision of the general statutes made by the commission appointed for that purpose.

Providing for the inspection of factories as to dangerous machinery, bad ventilation, etc.

Revising the methods of assessing the valuation of railroads, and imposing a tax of 1 per cent. on such valuation, and also on the amount of their funded or floating indebtedness.

That treasurers of savings-banks shall give new bonds at least once in six years.

That a druggist shall not make more than one sale on any liquor prescription.

That houses of persons who make a business of taking children under ten years to board, exceeding two at the same time, shall be under the supervision of the selectmen, and inspected monthly.

Amending the militia law so as to recognize the machine-gun platoons, and adding trumpeters to the militia.

That no cemetery association shall make any regulation prohibiting the erection of headstones provided by the State for the graves of soldiers, sailors and marines.

That \$10,000 of bonds, mortgages, or money held by any church shall be exempt from tax, provided the revenue is used for church purposes, and provided

the society's property, real and personal, exempt from taxation, does not exceed \$20,000.

That no person not a citizen of the State shall be appointed a special constable, policeman, or deputy sheriff, excepting the Governor may appoint as special officer any regular employé of any railroad or steamboat company.

The Senate contained 14 Republicans and 10 Democrats; the House, 137 Republicans, 109 Democrats, and 2 Independents.

State Prison.—The remodeling of the State prison at Wethersfield, for which provision was made by the Legislature of 1886, was in progress during the year, and was nearly completed at its close. The improvements include not only additions to the former buildings, but the entire reconstruction of the cells and flooring, leaving only the stone walls of the old prison intact. When finished, the new structure will be one of the best-equipped institutions of its kind.

Railroads.—The Legislature of 1884 passed a law permitting the gradual removal of grade-crossings in the State, on petition of the railroad company or the local authorities to the board of railroad commissioners, the expense of such removal to be equally borne by the town and the railroad. Considerable anxiety was felt in the latter part of the year over the workings of this law, and petitions from more than forty towns were received by the Governor, urging him to call an extra session of the Legislature to secure its repeal. The danger apprehended arose from the intention of the New York, New Haven, and Hartford Railroad to abolish all its grade-crossings within two or three years, compelling the towns along the line to bear half of the expense. As the law contemplated only a gradual removal, and its execution rested entirely in the discretion of the commissioners, the Governor refused these petitions, believing that the board would carry out the spirit of the law and not impose too heavy a burden upon the towns by hastening removals.

COSTA RICA, one of the five Central American republics. The area is estimated at 19,980 square miles; and on Dec. 31, 1886, the population was 196,280.

Government.—The President of the Republic is Don Bernardo Soto, whose Cabinet is composed of the following ministers: Foreign Affairs, Finance, and Commerce, Don Mauro Fernandez; Interior, Public Works, Justice, Public Worship, and Charity, Don Cleto Gonzalez Viquez; War and Navy, Don A. de Jesus Soto. The United States Minister to the five Central American republics, resident at Guatemala, is Hon. H. C. Hall. The Costa Rican Consul-General at New York is Don José Maria Muñoz.

Treaties.—In September, 1887, the Costa Rican Congress ratified the extradition treaty with Guatemala. On July 26, 1887, the Presidents of Costa Rica and Nicaragua made a treaty at Managua, the principal provisions of which are the following: Confirmation of the

boundary treaty as it stands; permission to dig a canal and conduct enough water from Colorado river for improving the navigation of San Juan river, Costa Rica to pay 25 per cent. of the expense involved in such work; free navigation for all time on San Juan river and Lake Nicaragua; acknowledgment of Costa Rica's right in the canal; settlement of all doubtful points in the treaty having reference thereto; Costa Rica to be consulted in all matters of granting concessions relating to the canal or transit; liberty to navigate in Nicaraguan waters without exercising jurisdiction; fixing of a date when commissioners are to meet for determining the boundary-line.

Finance.—The report of the Minister of Finance, of June 8, 1887, shows that the national indebtedness stood as follows: Consolidated foreign debt, £2,000,000; home debt, \$527,819; paper money in circulation, \$1,044,983. Of the latter, \$25,000 were withdrawn and destroyed on January 22, and this canceling is to continue at the rate of \$25,000 quarterly till extinguished. It had been estimated by him that the home debt would be reduced to \$426,828 on Dec. 31, 1887; but the Government resolved to pay this amount by anticipation, and did so on September 30, much to the benefit of Costa Rican finances, the two series of bonds advancing in London to 79½ and 77½, respectively, on the strength of the dispatch announcing the liquidation of the internal indebtedness of the republic. Another wise financial measure, sanctioned by the National Government on Dec. 31, 1886, was the renting of the Central and Atlantic sections of the Government railroad to the Costa Rica Railroad Company, a London corporation, undertaking to finish the line under the management of Minor Cooper Keith, the well-known financier and railroad contractor. From 1879 to 1887 the Government had incurred an annual loss of \$48,000 on that portion of its railway, while it now ceded the management upon terms favorable to the national exchequer. The income of the nation in 1886-'87 was \$2,888,752, being \$176,188 in excess of the estimate; the actual outlay was \$2,772,315.

At the instigation of the President, a "banco hipotecario" is to be established in the capital, with a capital of \$1,000,000 in shares; the charter to extend over seventy years; to be a bank of deposits and issue; to do a general banking business, and advance, on first mortgage on long credits, money on real estate.

Army.—The actual strength of the active army in 1887 was 6,219 men; of the reserve, 1,067; national guard, 692; together, 7,978 men, commanded by 2,521 officers. There were 40,238 citizens capable of bearing arms.

Post-Office.—In 1886 there passed through the post-offices of the republic 2,437,639 items of mail matter, as follows: 664,910 letters; 325,738 Government dispatches; 618 registered letters; 9,576 postal-cards; 1,411,602 newspapers, and 24,959 sample packages. The in-

crease was 609,247 as compared with the previous year.

Telegraphs.—During the year 1886-'87 the national telegraph employed 27 offices, and 7 of them had been opened during the year. The income was \$22,962, against \$17,608 in 1885-'86, an increase of \$5,359. Messages dispatched to the interior during the fiscal year 1886-'87, 69,885; sent abroad, 4,191. New lines laid during the year, 20,324 metres. The telephone service of the capital was improved in July, 1886, by building a central station, and uniting all the telephones in one system. In July, 1887, the Minister of Public Works of Costa Rica completed with Señor Cuenca Cruz, of Paris, a contract respecting cable communication. Under it Señor Cruz is granted permission to lay one or more submarine cables from Costa Rica to the West Indies and Venezuela, and to New York. Permission is also granted to run the cables to any points in Central or South America. The contractor binds himself to connect these cables with the Canary cable system in course of construction. Costa Rica guarantees the contractor receipts amounting to 85,000 francs a year. The first cable must be laid within two years.

Railroads.—The Costa Rica Railroad Company has been formed in London to finish and operate the Central and Atlantic sections of the Government railway under a lease, with a share capital of £3,055,000, £1,255,000 of which are set aside for finishing the railroad, the first £355,000 shares being placed on the London market and sold on June 24, 1886, at 92½. The republic is a shareholder in the company to the extent of £600,000, and is also entitled to dividends in the net earnings, after the interest of 6 per cent. shall have been paid on the £1,255,000 named. The Pacific section of the railroad, which has remained under the Government's own management, showed net earnings of \$19,798 in 1885-'86, and of \$17,226 in 1886-'87. But this Government railway is in good running order, well equipped, and the workshops furnished with the best of machinery.

Steamer Lines.—During the summer of 1897 M. O. Keith completed arrangements for placing on the line from Port Limon to the United States eight steamers a month to convey plantains, such steamers to leave on Wednesday and Saturday of each week, the line to go into operation with the year 1888. The Government has extended to the end of 1887 the time which Don Rafael Montúfar has to perfect arrangements for the establishment of a line of steamers between Port Limon and New Orleans or New York.

Chinese Immigration.—On Jan. 27, 1887, the Minister of the Interior issued a circular directed to the captains of the ports of Puntarenas and Limon, saying that the Government will not, under any pretext whatever, allow the landing of individuals belonging to the Mongolian race arriving from China, whether

they come on their own account or under contract with others.

New Industries.—The Government procured from abroad 25 cwt. of superior cotton-seed, for free distribution among planters, in order to encourage this branch of agriculture, and also 10,000 "ramie" plants.

Rosewood.—Until the spring of 1887, no Costa Rican rosewood had been exported from the Pacific coast. But this trade has now been established.

The manufacture of salt has been undertaken at Puntarenas—a new enterprise.

Goods admitted Duty Free.—In July, 1887, the Congress of Costa Rica continued for another year the law exempting from duty the following articles imported into Costa Rica through Port Limon: Linseed-oil, turpentine, plows, harrows, pitch, carts, wheelbarrows, nails, stills, hammers, chopping-knives, wooden houses in pieces, doors, windows, putty, spades, pitchforks, rakes, pickaxes, paints, slates, cartspokes and felloes, salt, seed of all descriptions, screws, glassware, bits, sacks, galvanized iron, and zinc in sheets. The right to import Indian corn, beans, and rice duty free into Limon was also extended for one year.

Commerce.—The imports into Costa Rica during the fiscal year 1886-'87 amounted to \$4,562,727, as against \$3,428,696 in 1885-'86; an increase of \$1,134,031, from which \$718,846 railroad material is to be deducted, leaving the increase \$415,685. The exports were valued at \$3,296,508 during the calendar year 1886, but in 1886 they did not exceed \$3,225,807, the decrease being \$70,701. The various products shipped during 1886 were represented by the following amounts: Coffee, \$2,259,262; bananas, \$476,775; hides, \$95,754; gold-dust, \$27,840; cabinet and dye woods, \$39,289; other products, \$120,787. The amount of coin shipped was \$246,650, against \$229,351 in 1885. The American trade was as follows:

FISCAL YEAR.	Import into the United States.	Domestic export to Costa Rica.
1887	\$1,409,516	\$708,900
1886	898,045	548,215

The expansion of trade was due to the rise in coffee.

Education.—There were on Jan. 1, 1887, 138 primary public schools, attended by 14,478 pupils, who were taught by 278 teachers, the Government paying toward the expense involved in teachers' salaries the sum of \$108,598. Early in 1887 a decree was issued that, at the expense of the public treasury, eight young men and two girls, Cosa Ricans by birth, be sent either to Europe or the United States, after examination as to capacity; the former to study either mining, civil or mechanical engineering, or arts and manufactures, or the military or natural sciences, the latter artistic or any other suitable female pursuits, the monthly outlay for each pupil not to exceed \$50, with free passage.

CRAIK, DINAH MARIA MULOOK, an English novelist and poet, born in Stoke-on-Trent, Staffordshire, England, in 1826; died in Shortlands, Kent, Oct. 12, 1887. She was the daughter of a clergyman of the Established Church, who died when she was young, and was soon followed by his widow. At her death, the small annuity on which the family had depended ceased, and the young girl was left to take care of her two brothers with the earnings of her pen. Her first published book was one for children, "How to Win Love, or Rhoda's Lesson." Her first novel, "The Ogilvies" (1849), contained subtle delineations of character and life-like scenes, and was well received by the public, giving her a fair start in the literary life. This was followed by "Olive," which proved equally popular, and in 1851 by

anxious for a name such as he can build for himself, a man with great business capacity, and an inventor, a man who has solved the problem of capital and labor, and would accumulate a fortune in the ordinary course of events, making his natural instincts secondary to his religious convictions. Miss Mulock, herself prophetic, makes John Halifax say, "I nevertheless uphold a true aristocracy, the best men of the country. These ought to govern and will govern one day, whether their patent of nobility be birth and titles, or only honesty and brains." She has religious convictions and is forcible in their definition, but has no denominational feeling. Although the daughter of a churchman, she was not a churchwoman. In her earlier novels she frequently avows her belief in religious freedom of thought and action, "that every one's conscience is free, and that all men of blameless life ought to be protected by and allowed to serve the state, whatever be their religious opinions." This, a rare doctrine when Mrs. Craik wrote "John Halifax," has now come to be almost the popular voice.

Such books as "A Life for a Life," "The Woman's Kingdom," and "A Brave Lady," are good examples of the strong purpose around which Mrs. Craik drew her plot, as a wreath engraved in the glass encircles a goblet. The carving may be delicate and the cutting lend a shimmer of beauty to the glass, but its strength is not thereby enhanced.

The pure, tender, gentle woman, in her story of "My Mother and I," will long live as a perfect type of the holy estate of motherhood combined with that of true widowhood. In "A Noble Life" she represents a Scottish earl, the last of his line, heir to a wealthy estate, but a cripple, as the exemplification of the Christ principle humanly presented, developed in the soul and lived in a life of constant bodily suffering. In this hero we see a character of such intellectual breadth and spiritual depth that it can not be dwarfed or bound down by its environment, but illumines with divine light the lives of those about it. Her theme in this book might have been made surpassingly interesting, but not for the mere sake of tickling the fancy was Mrs. Craik ever tempted into the making of books. With the calm imperturbability born of her single, strong, moral purpose, she passes by openings into merely romantic or emotional fields of thought which would be entered with avidity by the ordinary novel-writer. She does not like the details of vice, but rather would shield the poor sinner in his shame, leaving the plague-spot to that dear Lord who can heal the miseries revealed to him. In addition to her novels she was also the author of several stories for girls, some volumes on social and domestic subjects, translations from the French, and innumerable magazine articles on a great variety of subjects. She took much interest in travel, especially in the Irish journey of

DINAH MARIA MULOOK CRAIK.

"The Head of the Family," a story of Scottish life in the middle classes, of one man's devotion to his family of younger brothers and sisters left dependent upon him by the death of his parents. Strange as it may seem, in a book whose title is simplicity itself, and whose plot is far from enigmatic, Mrs. Craik displayed qualities highly imaginative and dramatic. Soon after this story, appeared "Alice Learmont," a fairy tale. In 1852 followed "Agatha's Husband," "Avillon, and other Tales," and stories and books for young people.

In 1857 was published "John Halifax, Gentleman," her most popular novel. The author says of this book, that a goodly portion of it was written at an inn in the old town of Tewkesbury. Neither before nor since "John Halifax," has there been given to the world any such living portraiture of a gentleman, a Christian hero, a practical business man placed amid surroundings adverse to gentlemanliness, and in times full of corruption. This hero performs no deeds of sensational heroism, but leads an independently pure, strong life, which of itself is heroism when brought into contact with actual business life. Here is a man

1886, which is the subject of a book published with illustrations by her young friend, Noel Paton, "An Unknown Country."

As a poet, Mrs. Craik won a lasting though somewhat humble place. Her verse is good, and the sentiment is invariably noble. Her words are full of cheer and comfort, and will linger in the memory when many a finer lyric has been forgotten. Her most pleasing lyrics are "Rothsay Bay," "By the Alma River," "Philip my King," "Douglas, Tender and True," "Plighted," and "The Unfinished Book." "Philip my King" was written for her god-son, who afterward became known as "the blind poet," Philip Bourke Marston.

Like several other noted writers of the last half-century, Mrs. Craik seemed to wish, as she grew older, to address herself more especially to youth, and she carried with her into old age the same child heart and its sparkling freshness and grace, winning, as in earlier days, the love of the children. Among the most popular of her juvenile stories are "The Adventures of a Brownie" and "The Little Lame Prince." In the former, a sprightly, good-natured family brownie in contradistinction to a "family ghost," becomes the means of teaching the most wholesome lessons of law, order, and unselfishness in a very palatable and amusing way, so that even a brownie may be a missionary if he belongs to a good family. In "The Little Lame Prince" we have a diminutive political allegory, well adapted to youthful minds, and the same wholesome truths with which she fills her books for older people are conveyed in one of the most delightful little fairy stories.

In 1864 a pension of £60 a year was conferred upon Miss Mulock. A personal friend of hers writes: "In 1864 her literary work received the appreciation of a pension from the civil list, and the next year her personal life was crowned by her marriage to George Lillie Craik, the younger. Mr. Craik, who is a member of the publishing firm of Macmillan & Co., was somewhat younger than his wife, but the marriage was most happy as she once had occasion to say to another lady who came to her in regard to a marriage under similar conditions: "The home that Mr. and Mrs. Craik built for themselves was one of the most charming about London, across "the lovely Kentish meadows" at Shortlands, ten miles southeast of London. It stood in the pleasant English country, with a delightful garden stretching out from it, and outside the house toward the garden was a little recess called "Dorothy's Parlor," where Mrs. Craik was fond of taking her work or her writing on a summer's day. It was named for the little daughter they had adopted years ago, having no children of their own, who was the sunshine of the house up to the time of her foster-mother's death. Within the recess was the Latin motto "Deus hæc otia fecit" (God made this rest), which Mrs. Craik once said, she se-

lected as the motto she would wish to build into a home of her own, should it ever be given to her to make one. In the house there was one charming room that served for library, music-room, and parlor, filled with books and choice pictures, but chiefly beautiful because of the presence of its mistress, as she brought her work-basket out for a quiet talk with her friends. Over the mantel of the dining-room was the motto "East or West, Home is best," which pleasantly gave the spirit in which Mrs. Craik lived in her home, for she used to say that home-keeping was more to her than story-writing, and she often got only one hour a week for her pen. She was tall and stately in carriage, with a winning smile and a frank and quaint manner, which gave one the best kind of welcome, and her silver-gray hair crowned the comfortable age of a woman who had used her years, one could see and feel, always to the best purpose. In the spring of 1887 Hubert Herkomer painted Mrs. Craik's portrait. Frances Martin says of it that "he depicts all that the painter can render of the repose, the quiet dignity, and the beauty of her advancing age. All but the few who remember the elegance of her youthful figure, and the intent gaze of the youthful face, will be contented with such a portrait. It is true to her as she lived and as she died." Mrs. Craik's death was caused by failure of the heart's action. The passing away was as peaceful as any death she has described. It was like that of Catherine Ogilvie, and like the falling asleep in death of John Halifax, and as like a translation into the Heavenly Land as that of Ursula his wife. It was the death Mrs. Craik had always foreseen for herself. Her only desire was to live long enough to witness the marriage of her adopted daughter; when this could not be, she murmured, "No matter, no matter," a fitting remark from the lips of one who had once penned these words "whether we see it or not, all is well." The Sunday after her death, in the church she had attended at Shortlands, Mr. Wolley, in his sermon, introduced this stanza from one of her poems:

"And when I lie in the green kirkyard,
With the mold upon my breast,
Say not that she did well—or ill,
Only, 'She did her best.'"

Mrs. Craik was a conspicuous advocate of the legalization in England of marriage with a deceased wife's sister, in order that the law might be uniform at home and in the colonies, and not long before her death she offered, in promotion of this reform, to reissue her "Hannah," with a new preface dealing with the question. She always considered that the critics and the public were wrong in ranking her most famous work as her best. "A Life for a Life" she invariably maintained was her highest reach in fiction, an opinion shared by many of her literary friends.

There must be, however, in "John Halifax" a quality that appeals to the universal heart, a

certain homeliness that causes it to be read and loved wherever English is spoken. Her last completed literary work was an article for "The Forum," published in New York, and at the time of her death she was at work upon another article for the same periodical, entitled "Nearing the End." She left an estate of about \$85,000.

The following list of Mrs. Craik's works was made last year by her husband, with her co-operation, adding one or two that have since appeared. Novels: "The Ogilvies" (1849); "Olive" (1850); "The Head of the Family" (1857); "Agatha's Husband" (1853); "John Halifax, Gentleman" (1857); "Christian's Mistake" (1865); "A Noble Life" (1866); "Two Marriages" (1867); "The Woman's Kingdom" (1869); "A Brave Lady" (1870); "Hannah" (1871); "My Mother and I" (1874); "The Laurel Bush" (1876); "Young Mrs. Jardine" (1879); "His Little Mother" (1881); "Miss Tommy" (1884); "King Arthur" (1886). Miscellaneous works: "Avillion and other Tales" (1853); "Nothing New" (1857); "A Woman's Thoughts about Woman" (1858); "Studies from Life" (1861); "The Unkind Word and other Stories" (1870); "Fair France" (1872); "Sermons out of Church" (1875); "A Legacy, being the Life and Remains of John Martin, Schoolmaster and Postmaster" (1878); "Plain Speaking" (1882); "An Unsentimental Journey Through Cornwall" (1884); "About Money and Other Things" (1886); "An Unknown Country" (1887). Poetry: "Poems" (1859), expanded into "Thirty Years' Poems, New and Old" (1881); "Children's Poetry" (1881); "Songs of Our Youth" (1875). Children's Books: "How to Win Love; or, Rhoda's Lesson" (1848); "Cola Monti" (1849); "Alice Learmont, a Fairy Tale" (1852); "A Hero" (1853); "Bread Upon the Waters" (1852); "The Little Lychetts" (1855); "Michael the Miner" (1846); "Our Year" (1862); "Little Sunshine's Holiday" (1875); "Adventures of a Brownie" (1872); "The Little Lame Prince" (1874). She also prepared the "Fairy Book" and "Is it True?" two volumes of old fairy tales translated from Mme. Guizot de Witt's "Motherless, or a Parisian Family," "A French Country Family," "The Cousin from India," and "Twenty Years Ago," and edited a series of books for girls.

CUBA, an island in the West Indies, belonging to Spain. (For statistics of area, population, etc., see "Annual Cyclopædia" for 1883.)

Army.—The Commander-in-Chief and Captain-General of the island is Don Saba Marin, and the Segundo Cabo, Señor Sanchez Mira. The strength of the Spanish forces in Cuba in 1887 was 19,000.

Finance.—The Cuban budget for 1887-'88 estimates the outlay at \$22,862,541, being \$3,097,194 less than for 1886-'87. The income is estimated at \$23,278,100, hence there would result a surplus of \$410,559 in spite of the sup-

pression of the export duties on sugar, molasses, and rum, the reduction by 20 per cent. of the consumption tax, and the annual reductions fixed with reference to the traffic between Cuba and the Peninsula, such reductions being estimated to aggregate \$2,721,625.

A highly creditable measure was the payment by anticipation of the custom-house bonds of 1878 still in circulation, and of the 6-per-cent. hypothecary bonds of 1880 at par, in Cuba, Madrid, Paris, and London, on July 1 and Oct. 1, 1887, respectively. The directors of the Spanish Bank declared on July 1 a semi-annual dividend of 4 per cent. gold; and the Bank of Commerce declared a semi-annual dividend of 8 per cent. A new bank is to be founded at Havana by tobacco-exporters, for the purpose of facilitating their dealings.

General Condition.—Cuba, being thinly populated, mountainous toward the east, and thickly wooded, with comparatively few railways and good high-roads, while lying within the tropics, is still suffering from the disorders resulting from a ten years' insurrection and the abolition of slavery. The daily press teemed in 1887 with accounts of highway robberies, the kidnapping of well-to-do farmers, and even children, held for a ransom, incendiarism, and even a few landings of filibusters. Soldiers, mounted police, and armed bands of citizens have been keeping up a lively warfare with those anarchical elements, but the task is difficult, and it may take some time yet ere the island is purged of those disorderly elements continually cropping up again in consequence of the deep demoralization which seems to exist in a portion of the lower stratum of society. To a considerable extent it also exists among merchants and Government officials, notably revenue officers; hence the Captain-General was compelled to take energetic measures to arrest gigantic frauds at the Havana Custom-House, the existence of which had been no secret for a long time. Small-pox and yellow-fever were exceptionally malignant in 1887 at Santiago de Cuba and elsewhere. Extensive and destructive inundations also occurred, and an earthquake visited Santiago September 23, but without doing much harm. Yet planters have borne these visitations with patience, as the great planting interest is evidently entering upon an era of comparative prosperity through the better organization of labor and the sugar industry, the gradual appreciation of the value of the staple, and several well-timed reforms, chiefly in the interest of the agricultural and mercantile classes.

Suspensions having been aroused that the treasury was systematically defrauded through the connivance of custom-house officials at Havana, the Captain-General, on Aug. 18, 1887, ordered the military seizure of the custom-house, all means of outlet to the wharves and warehouses having been closed, and guards established over every wharf and avenue. For several days following a committee of investi-

gation was engaged in an examination of the recent operations of the custom-house, and the superior officers and many subordinates were suspended. Meanwhile, all other operations were paralyzed—the wharves were covered with goods, numbers of loaded lighters were not permitted to discharge their cargoes, while crowds of laborers were standing around idle. Several committees of importing merchants called upon the Captain-General, and, admitting that they were more or less compromised in the irregular way of doing custom-house business, begged to be allowed to correct their entries already made. But three days were allowed them, and during that time the ordinary receipts from customs duties were more than trebled. The Government at Madrid approved the acts of the Captain-General. The resignation of the Intendant-General of Finance was also accepted, and Don Anibal Arieste was put in charge of the custom-house as special delegate of the Captain-General.

Reforms.—The excise duty on fresh meat was reduced July 1 from 30 cents to 25 cents on each eight kilogrammes, and the collection was committed to the Spanish Bank according to an agreement made in Madrid between the governor of the bank and the Home Government. The amount to be collected is \$1,000,000. Cigars manufactured for local consumption, and not packed in boxes, but simply wrapped in paper, it was decided by the Intendant General, are henceforth not to be subjected to the stamp duty. The following Spanish-colonial products are to be admitted duty free into Spain and the Balearic Isles, provided they are shipped thither direct under the Spanish flag: Sugar, molasses, rum, coffee, chocolate, and cocoa. Those shipped under a foreign flag are to be subject to the duties established by the law of June 30, 1882, which duties are gradually being reduced till the year 1890, with the difference that products under a foreign flag coming from the Philippine Islands are only to pay one fifth of the duty that Cuban products are subject to.

Emancipation.—A royal decree dated Oct. 7, 1886, abolished the "patronato" or semi-slavery in Cuba, which was a transitory form of servitude created by the Abolition Law of Feb. 18, 1880, thus doing away with the last vestige of slavery.

Immigration.—At the instigation of the Crédito Territorial Hipotecario de la Isla de Cuba, arrangements were made in March to set on foot a current of Italian immigrants of the laboring-class, sugar-planters being anxious to procure field-hands and other operatives from Southern Europe, such operatives to receive \$15 a month the first half of the year, and \$9 the latter half, together with board and lodging, if between the ages of eighteen and fifty.

Modus Vivendi Treaty.—On Sept. 21, 1887, the Department of State at Washington published the ensuing memorandum of an agreement between the Government of the United States and the Government of Spain for the reciprocal

and complete suspension of all discriminating duties of tonnage or imposts in the United States and the islands of Cuba and Porto Rico and all other countries belonging to the Crown of Spain, upon vessels of the respective countries and their cargoes:

1. It is positively agreed that from this date an absolute equalization of tonnage dues and imposts shall at once be applied to the production of or articles proceeding from the United States or any other foreign country, when carried in vessels belonging to citizens of the United States and under the American flag, to the islands of Cuba, Porto Rico, and the Philippines, and also to all other countries belonging to the Crown of Spain, and that no higher or other tonnage dues or imposts shall be levied upon said vessels and the goods carried in them, as aforesaid, than are paid by Spanish vessels and their cargoes under similar circumstances.

2. On the above conditions the President of the United States shall at once issue a proclamation declaring that these discriminating tonnage dues and imposts in the United States are suspended and discontinued as regards Spanish vessels and produce, manufactures or merchandise imported into the United States proceeding from Spain, and from the aforesaid possessions and from the Philippine Islands, and also from all other countries belonging to the Crown of Spain, or from any foreign country.

This protocol of an agreement is offered by the Government of Spain and accepted by that of the United States as a full and satisfactory notification of the facts above recited.

3. The United States Minister at Madrid will be authorized to negotiate with the Minister for Foreign Affairs, either by an agreement or treaty, so as to place the commercial relations between the United States and Spain on a permanent footing advantageous to both countries.

Americans in Cuba.—About the middle of October the Government published at Havana some new regulations, according to which American citizens are now allowed to land at or depart from Cuban ports without being obliged to present a passport or other document signed by a Spanish consul. A simple certificate from the American consul at the port of entry henceforth suffices for the identification of any citizen of the United States, and enables him to travel all over Cuba, to remain on the island as long he pleases, and to leave whenever he wishes.

Railroads.—A concession was granted to Don Marcos Fial y Cabrizas to build in the province of Santiago de Cuba a railroad between Palma, Soriano and San Luis. A branch line has been built connecting Remedios with Rojas and the Zaza Railway. In February work was begun to extend the Western Railroad from Consolacion del sur to Pinar del Rio. A French company has taken the necessary steps to build a railroad from Holguin to Nipe. The Matanzas Railroad reduced, early in the year, the freight on new machinery 50 per cent., and on old machinery 65 per cent., coal to pay 70 cents a ton, and only 63 cents on quantities of 1,000 tons and upward. Application was made early in the year for a concession to construct a railway to connect Sagua la Grande with Manicaragua, where, next to that of the Vuelta Abajo, the best tobacco is grown in Cuba. The government of the island has resolved that a branch railway be built from Júcaro to Punta de Burro, in order to

facilitate the export of cattle and wood from Moron and Olegode Avila. During 1886 the Cerro, Jesus del Monte, Carmelo and Principe lines of tramway in the city of Havana, with the Vedado and Vibora branch lines, forwarded altogether 5,529,604 passengers paying fares, and 99,896 riding free; together, 5,629,000 passengers; the total fare collected being \$766,795. Adding thereto \$15,169 accruing from other sources of income, the total gross earnings reached \$781,964; and deducting therefrom the expenses, \$572,647, there were net earnings to the amount of \$209,317 or 18 per cent. on the capital. The Minister of the Colonies at Madrid has decreed a general plan of high-road building for Cuba.

Telegraphs.—The Spanish Minister of the Colonies granted during the summer a concession to Don José Rafael, Vizarrondo to lay a cable between Cuba and Hayti. A cable was laid early in the year in the bay of Havana, connecting Forts el Morro, la Cabaña, and the city of Havana.

Steamship Lines.—The subsidy that the Spanish Government has agreed to pay the Spanish Transatlantic Steamship Line insures the following: Line between Spain, the Spanish West Indies, and Mexico, 36 voyages per annum; Philippine Island line, 13 voyages; La Plata, 6 voyages; Fernando-Po, 6 voyages; Morocco, 24 voyages. The company engages to establish branch lines for the traffic with the United States, Central America, the Marianne and Caroline Islands, China, and Japan.

Meteorological Observatory.—The Government intends establishing a meteorological observatory at Santiago, and has written to New York, London, and Paris for the purpose of procuring the latest and most approved instruments.

Farming.—The new sugar-making system known under the name of central plantations has given satisfactory results to all planters who have been able to adopt it. The number of plantations of this class increased notably in 1887, absorbing at the same time all the surrounding small ones. Land-owners of the demolished estates subdivide them among farmers and small planters, who sell their cane to the central factories at prices that are either paid in money or in manufactured sugar, \$2.50 for 100 pounds centrifugal, as an average, being generally considered as the equivalent for 2,500 pounds of cane after grinding and marketing expenses are deducted. It has been estimated that from 35 to 40 per cent. of the 1887 crop has been manufactured under this system, and that, despite the disappearance of slavery and the financial difficulties under which a large number of planters have been laboring, sugar-crops above the average in size will be produced. In the Zaza Central sugar-house a new sugar-bagging machine, invented by Don Joaquín Bárbara, was introduced early in 1887, an apparatus evidently destined to do good service as a labor-saving machine. Señores Mendieta and Gorriti have introduced a new furnace for sugar-

houses, in which "leagasse," or expressed cane, is advantageously utilized as the only fuel. The Cuban sugar-crop, ended Dec. 1, 1886, was 637,237 tons for export, besides 85,000 tons for home consumption; together, 672,237 tons, against 625,311 tons in 1885. The exports to Aug. 1, 1887, amounted to 391,506 tons, while the stock in the six ports on that date was 116,798 tons; total, 508,299 tons, against exports during the corresponding period in 1886 of 418,764 and stock 174,845 tons; total, 593,609. These figures, showing a falling off of 85,310 tons in the crop up to August 1, indicated that the crop of 1887 would not exceed in yield 600,000 tons, which has since been confirmed. A fresh impulse is to be given to cocoa-planting, which had been allowed to go to decay, there being only twenty-five plantations in the island. Don José Antonio Barrera, Don Manuel Delgado, and Don Manuel Carrera y Sterling of Remedios purchased early in 1887 the Itabo cocoa estate of Yaguajay, in order to extend and replant it and revive this branch generally in the district.

Botanic Garden.—In the Campo de Marte the necessary transformation was taken in hand in May to lay out six lateral gardens, in which Philippine plants imported by Dr. Villaraza are to begin the creation of a botanic garden.

Iron-Mining.—In 1883 an American company bought a group of the iron-mines that had been claimed, and built a railway 16½ miles in length, and a large wharf. In 1884 the company exported to the United States 22,000 tons of ore; in 1885, 80,000 tons; and in 1886, 110,000 tons. But, so far, they have not begun to ship in proportion to the capacity of the mines; that they may do so they are building a line of steamers of their own under the English flag, two of which vessels are already running. When the ships are completed they expect to ship 1,000 tons of ore a day. There is no underground mining of this ore, but merely cutting down the hill-side, throwing away the incasing dirt and rock, and taking out the ore from the solid vein. Although some contracts have been lately made with people in the United States for manganese-mines, none of them have been worked.

Commerce.—The trade of the Spanish West Indies was distributed among leading commercial nations as follows:

NATION.	Imports.	Exports.	Total.
United States ..	\$46,410,856	\$10,575,865	\$56,986,721
England	4,798,886	10,582,737	15,381,623
France	2,608,158	1,157,939	3,766,147
Spain	9,473,588	18,610,573	28,084,166

The American trade with Cuba is shown in the following table:

FISCAL YEAR.	Import from Cuba into the United States.	Domestic export from the United States to Cuba.	Total trade.
1888	\$65,544,584	\$14,567,918	\$80,112,456
1884	57,181,497	10,569,880	67,744,577
1885	42,906,068	8,719,195	51,625,268
1886	51,110,780	10,090,679	61,181,639
1887	49,513,484	10,188,980	59,654,864

Columbus's Remains.—The mortal remains of Christopher Columbus were removed from the cathedral of Havana, where they had hitherto found a resting-place, to the city of his birth,

Genoa, on board the Italian man-of-war, *Matteo Brazza*, on July 2, in charge of Monsignore Cocio, the Papal Internuntius in Brazil, and buried with great ecclesiastical pomp.

D

DAKOTA. Territorial Government.—The following were the Territorial officers during the year: Governor, Gilbert A. Pierce, Republican, succeeded by Louis K. Church. Democrat; Secretary, M. L. McCormack; Treasurer, J. W. Raymond; Auditor, E. W. Caldwell, succeeded by James A. Ward; Superintendent of Public Instruction, A. S. Jones, succeeded by Eugene A. Dye; Attorney-General, George Rice, succeeded by O. F. Templeton; Commissioner of Immigration, Lauren Dunlap, succeeded by P. F. McClure; Chief-Justice of the Supreme Court, Bartlett Tripp; Associate-Justices, Charles M. Thomas, William H. Francis, William B. McConnell, Cornelius S. Palmer, Louis K. Church, succeeded by James Spencer.

Legislative Session.—The Seventeenth Territorial Assembly convened on January 11, and remained in session two months. One hundred and thirty-five new laws, and twelve joint resolutions, were passed. The most important measures were the appropriation bills, the local-option law, and the law submitting the question of division of the Territory to a vote of the people. In the matter of appropriations, the session has been criticised for its extravagance. The total appropriations were \$1,530,718, as against \$705,000 in 1885. The local-option bill provides that on petition of one third of the legal voters of any county, an election shall be held at the time of any general election, to determine whether prohibition or license shall prevail in that county. Under this law, at the November election, a large majority of the counties declared for prohibition. Another act of this Legislature authorizes the acceptance of the partially-constructed Capitol building at Bismarck. When the Territorial capital was removed to Bismarck, in 1883, that city gave 320 acres of land, and agreed to erect a suitable structure within that area; but as accepted, the building is without the north and south wings originally planned, and the Territory assumes about 70,000 of unpaid bills incurred in the construction. It is provided that these bills be paid by a sale of the adjoining lots given by the city. Other acts of the session were:

Creating two agricultural districts, and providing for a board of agriculture for each district. There had been one board for the whole Territory previously.

To provide for the construction and maintenance of artesian wells, appointing a well-commissioner for each county, and prescribing his duties and regulating the assessment and collection of taxes for such wells.

Creating the office of county auditor.

Authorizing incorporated boards of education or school districts to refund outstanding indebtedness; also giving cities and counties like authority.

Permitting cities and municipal corporations to issue bonds for erecting school and other public buildings, and for other public improvements.

Permitting the construction of bridges over navigable rivers, and providing the manner for paying for them.

To suppress and prevent the spread of contagious or infectious diseases among domestic animals, and creating the office of State Veterinary Surgeon.

To appropriate, for the support of fire departments of each city, town, or village a part of the tax paid by fire-insurance companies upon premiums received in any such town, city, or village.

Regulating the manner of ingress and egress of public buildings.

To allow the establishment of free libraries and reading-rooms by towns or cities, upon the approval of a majority of the electors voting upon the question, and authorizing a tax-levy for their support.

Increasing the annual license-fee for the sale of liquors, and fixing it at sums from \$500 to \$1,000. It was from \$200 to \$500 previously.

Protecting the use of irrigating ditches.

Declaring that woman shall retain the same legal existence and personality after as before marriage.

To regulate the practice of pharmacy, the licensing of persons to carry on such practice, and the sale of poisons in the Territory.

To create the office of public examiner, and dividing the Territory into two examiners' districts. These officials are directed to exercise a constant supervision over the books and financial accounts of the several public, educational, charitable, penal, and reformatory institutions of the Territory, and are invested with large powers to investigate the general management of the institutions.

To regulate grain-warehouses, and the inspection, weighing, and handling of grain, and defining the duties of the Railroad and Warehouse Commission in relation thereto.

Raising the age of consent from ten to fourteen years.

Providing the manner for assessing the stocks and shares of banks and bank associations, and collecting tax for the same.

Creating liens on the crops of persons buying seed on credit, and providing for filing and foreclosing the same.

Creating a new Capitol Commission, to have control of the Capitol and grounds, and to superintend the sale of certain lands given to the State and hold for the benefit of the public-building fund.

To create Pierce and Church counties, and to define the boundaries of certain other counties.

Population.—The Territory has had another year of wonderful growth in population. The building westward, through the northern counties of Dakota, of the St. Paul, Minneapolis, and Manitoba Railroad, and the construction by this and the Northern Pacific Railway companies of numerous north and south feeders, has turned a great tide of immigration toward the agricultural and stock lands of the Mouse river, Turtle mountains, Devil's lake, and other regions. This, together with the largest crop ever harvested in many sections of Northern Dakota, have made it almost impossible to keep

pace with the development going on in the districts named. A few of the more westerly counties, having scarcely a single inhabitant at the beginning of the year, are now well populated with thrifty farmers and residents of towns that have grown up in a day. According to the Federal census, in 1860 Dakota had a population of 4,837; in 1870, of 14,181; in 1880, of 135,177; in 1885, as shown by the Territorial census, 415,610. At the close of 1887, careful estimates show over 600,000.

Land Ownership.—The entire area of Dakota is 96,596,480 acres. Of this, 26,847,105 acres are contained within Indian reservations; about 7,000,000 acres were granted by the Government to aid in the construction of the Northern Pacific Railroad; 3,000,000 acres are set aside for support of schools; and, according to computations made from the records and plat-books of the several land districts, there had been disposed of, up to June 30, 1887, 35,937,930 acres under the general land laws, leaving a vacant area open to settlement at this time (not deducting the small area of unsurveyed lands held by squatters) of 23,811,445 acres. As an area equal to 2,067,281 acres was taken up by the filing of entries during the year ending June 30, 1887, the time when all the vacant land will be settled can be computed.

Finances.—The total bonded indebtedness of the Territory is \$1,098,800, bearing from 4 to 6 per cent. interest, all of it incurred in the construction of public institutions. Of this amount \$530,100, or nearly half, was authorized and incurred by the Legislature of this year for improvements and additions to the already crowded benevolent and penal institutions. For the Insane Hospital at Yankton, \$92,500 in bonds was authorized; for the Deaf-Mute School at Sioux Falls, \$23,000; for the University of Grand Forks, \$20,000; for the University of Vermillion, \$30,000; for the Penitentiary at Sioux Falls, \$14,800; for the Penitentiary at Bismarck, \$29,000; for the Agricultural College at Brookings \$54,500; for the Insane Hospital at Jamestown, \$153,000; for the Normal School at Madison, \$35,800; for the School of Mines at Rapid City, \$28,000; for the Reform School at Plankinton, \$30,000; and for the Normal School at Spearfish, \$25,000. At the same time the 6-per-cent. 5-20 bonds of 1881, amounting to \$90,000, were refunded at 4½ per cent. Bids for these bonds were received and opened May 30. The highest bid was par and 0.52 per cent. premium. Five sixths of the bonds issued and sold bore 4½ per cent. interest; the balance 5 per cent., most of them subject to an option clause, reserving the right to redeem in five and ten years. This is the first time in the history of the country that a Territorial bond has sold for less than 5 per cent.

The total assessment of property in the Territory in 1885 amounted to \$106,499,549; in 1886, to \$132,542,703; and in 1887, to \$157,084,365. The per cent. of increase in valua-

tion in 1887 was not as large as in previous years, owing to the assessments being made at a lower valuation; yet the increase in acreage was much larger, being nearly 40 per cent. This extraordinary increase is due in part to the rapid growth of the Territory, and in part to the assessment of several million acres of land owned by the railway corporations, which had heretofore escaped taxation. The Legislature of 1883 provided for the taxation of railroads upon their "gross earnings," and all property of such corporations has heretofore been held exempt under the "gross-earnings law." The average local levy for all purposes for 1885 was 8 mills, for 1886 it was 2.4 mills, and for 1887 it was 2.9 mills.

Railroads.—At the beginning of this year the total number of miles of road operated in the Territory was 3,491. During the year over 700 miles of new road were completed, making a total of about 4,200 miles. Of these new constructions, the most important are on the Northern Pacific from Grand Forks to Pembina, 95 miles, on the St. Paul, Minneapolis, and Manitoba from Minot, west 180 miles, and on the Chicago, Milwaukee, and St. Paul from Bristol to Lake Preston, 75 miles.

Education.—During 1879, only 25 per cent. of the school population were in regular attendance. The per cent. in 1883 increased to 37, while in 1887 there were 53 per cent. attending every day for the whole term of 112 days. In this respect Dakota leads nearly all of the States.

Taxation for the support of common schools is of four kinds: 1. The county clerk at the time of making the annual assessment, levies a tax of \$1 upon each elector; 2. At the same time he levies an additional tax of two mills upon each dollar of taxable property in the county, and the fund raised by these two he divides among the townships in proportion to the children of school-age resident thereof; 3. A township tax not exceeding 8 per cent. of the taxable property of the township is levied by the township board for the support of the schools of the township; 4. The patrons of any given school may meet in what is known as a subdistrict meeting and vote an additional tax upon their own property for the support of the school of their own subdistrict. The law of 1887 has made considerable change in the organization and administration of the school system of the Territory. The general supervision and control of public instruction is vested in a Territorial Board of Education consisting of three members appointed by the Governor. The Territory has established two universities, one at Vermillion, having 193 students by the last report, and one at Grand Forks, recently established, having 75 pupils; a State normal school at Madison, having 174 pupils; a territorial normal school, with 104 pupils; an agricultural college, with 256 pupils; and a school of mines, opened this year.

The private universities and academies are

Pierre University at Pierre, Yankton College, at Yankton, Dakota University at Mitchell, Sioux Falls University and All-Saints School at Sioux Falls, Jamestown College, Tower University, Groton College, Redmond College, and Augustana College. Over 600 students attend these institutions.

Charities and Prisons.—The Hospital for the Insane at Yankton has a capacity for 120 patients, but in September 160 inmates were reported. To relieve this crowded condition, the appropriation of the Legislature previously mentioned was made, but as charges of irregularity were preferred against a majority of the Board of Trustees of the institution, the Governor refused to sanction the expenditure of this appropriation under the direction of the present board. The North Dakota Hospital at Jamestown is in the third year of its existence, and had cared for 248 patients up to September of this year. There were then 147 inmates. The Legislature of 1883 located a reform school at Plankinton, Aurora County, but no appropriation for the erection of buildings or the maintenance of the school was made till 1887. The contract for the building was let August 9, and the work is now in progress. At the Sioux Falls Penitentiary there were 82 convicts in June, against 93 at the same time last year. At Bismarck there were 56, an increase of 4 over 1886.

Mining.—The Black Hills produce all the gold and silver mined in Dakota, and nearly the entire output is credited to but four mines. The total production of gold and silver since the settlement of this region in 1877, is \$38,770,000. In 1886 the product was \$3,125,000, a slight decrease from 1885. The whole country west of the Missouri river and a large part of the surface of North Dakota is underlaid with a deposit of lignite coal, which crops out in many places in veins 18 feet thick; at present, from lack of transportation facilities, only these outcroppings are worked, and generally for the supply of the neighborhood simply. But along the Northern Pacific Railway at Sims in Morton County, Dickinson in Stark County, and Little Missouri in Billings County, coal-mining is already carried on extensively, and thousands of tons are shipped as far east as Jamestown. It is estimated that during the winter of 1886-'87 10,000 tons were shipped into the city of Bismarck, where it is retailed at \$3.50 a ton.

At Sioux Falls, Dell Rapids, and other points of Southeastern Dakota, along the Big Sioux River, there is an outcropping of the most remarkable deposit of quartzite (granite of jasper) ever discovered on the continent. Eight hundred car-loads of this granite were shipped last year from Dell Rapids alone.

In several sections of Dakota great interest is manifested in discoveries of natural gas, and companies have been formed at Blunt, Jamestown, and Fargo to utilize these discoveries.

Agriculture.—The season of 1886 was not al-

together favorable to farming interests in the Northwest, although, owing to the opening of new farms, and the increased acreage sown, the yield in every instance was in excess of that of the previous season.

The season of 1887 was more favorable, and reports from the corn-crop show that it will reach 27,000,000 bushels, an increase over last season's yield of about 70 per cent. The area sown to wheat in 1887 is estimated at 3,899,389 acres, and the yield will approximate 60,000,000 bushels, or about one seventh of the entire wheat-crop of the United States last year.

Stock-Raising.—In 1885 the value of live-stock in the Territory was \$40,528,897. At the beginning of this year the value had increased to \$42,828,838, an amount nearly 50 per cent. greater than the value of the three principal farm products—wheat, corn, and oats—of the same year. In seven years the value of live-stock in Dakota has increased \$36,365,065.

Militia.—The present militia of the Territory, designated as the Dakota National Guard, consists of 2 regiments of infantry of 9 companies each, one battalion of mounted infantry of 2 companies, and a battery of artillery of 2 guns. The maximum number of enlisted men to each company is 50 men and 3 commissioned officers.

The effective strength of this command is 1,031 enlisted men and 84 commissioned officers of the field, staff, and line. The general staff consists of 22 commissioned officers; total number, 1,136.

Indians.—Dakota leads all the States and Territories in the Union (excepting, of course, the Indian Territory) in the numbers of her Indian population and the extent of her reservations; nearly one fifth of her entire area is set apart for the use of 80,076 Indians. If the existing reservations were divided equally among them, there would be 892 acres for every man, woman, and child. The Great Sioux Indian reservation stretches from Missouri river on the east to the Black Hills on the west, from the Nebraska boundary on the south almost to the city of Bismarck, in Northern Dakota, and occupies nearly one fourth of the area of Dakota. It contains 22,010,048 acres, on which reside 23,093 Indians. This area includes a tract known as the Crow Creek and Winnebago reservation, which was thrown open to settlers by order of President Arthur. Early this year, however, by advice of the Attorney-General, President Cleveland revoked the order, and directed all white settlers to be driven out. This entailed severe hardship on innocent settlers under the first order, and was not obeyed until the military were brought into use.

Division.—By a law passed in March, it was provided that the people of the Territory should express their opinion, at an election in November, upon the question whether Dakota should be admitted as two States or as one, the division, if favored, to be on the seventh

standard parallel, an established line corresponding with the 46th parallel of latitude. Preliminary to the election, two divisionist conventions were held, one for South Dakota at Huron, July 13, and one for North Dakota at Fargo, July 23, at which a plan of campaign was adopted and resolutions favoring division passed. Among the resolutions of the Huron convention were these:

Resolved, That we reaffirm the declarations already many times made in constitutional conventions, legislative assemblies, and in memorials to Congress, that we are unalterably opposed to admission as a whole.

This convention declares for the division of this Territory into North Dakota and South Dakota, on the seventh standard parallel, and that we seek such division for the reason, among others, that good government, economical and well administered, will be more readily secured thereby for both sections than by admission as a whole. That thereby we shall have our proper and rightful representation in Congress, preserve that just balance of power to which a great population should be entitled, and secure the highest permanent good for both North and South Dakota.

That the convention affirms its conviction that it is the just and primary right and province of a people about to be admitted to the Union to designate their State boundaries, subject to be modified with their consent upon the proposal of Congress, for grave reasons only affecting the general welfare.

While we recognize the fact that the Constitution confers upon Congress a just discretion in the admission of new States, we protest against the unjust and tyrannous exercise of power by refusing to admit a new State into the Union upon an equal footing with other States, after having fulfilled the purposes of Territorial life.

At the November election the divisionists were in the majority. Southern Dakota voted generally in favor of division, and Northern Dakota against it.

DELAWARE State Government.—The following State officers assumed or held office at the beginning of the year: Governor, Benjamin T. Biggs, Democrat; Secretary of State, John P. Saulsbury; Treasurer, William Herbert; Auditor, John H. Boyce; Attorney-General, John H. Paynter; Superintendent of Free Schools, Thomas N. Williams; Chief-Justice of the Supreme Court, Joseph P. Comegys; Associate Justices, Ignatius C. Grubb, John W. Houston, Edward Wootton; Chancellor, Willard Saulsbury. The office of Superintendent of Free Schools was abolished during the year by a legislative act. In March the death of Judge Wootton created a vacancy on the Supreme bench which was filled by the appointment of Attorney-General Paynter. The Assistant Attorney-General, John Biggs, son of the Governor, was then promoted by his father to the Attorney-Generalship.

Statistics.—Careful estimates show that the population increased from 146,000 in 1880 to about 170,000 in 1887. There are 110,000 people living in cities, towns, and villages, and 60,000 residing on farms and engaged in agricultural pursuits. One city has a population of 55,000, one city over 3,000, four towns over 2,000, ten towns over 1,000, seven towns over 500, fifteen villages over 300.

The farms of the State are now valued at \$36,789,672, live-stock \$4,000,000, valuation of cities and towns \$60,000,000, annual products manufactured \$40,000,000, agricultural products \$10,000,000—\$150,000,000 besides the personal property and investments.

Finances.—The State debt, at the beginning of the year, was composed of 4-per-cent. State bonds to the amount of \$585,000, 6-per-cent. school-fund bonds valued at \$156,750, and \$88,000 of indebtedness to Delaware College bearing 6 per cent. interest. By an act of the Legislature in March authority was given the treasurer to refund \$250,000 of the State bonds at 8 per cent. interest. The new bonds are payable in 10 to 30 years at the option of the State. There are assets in the State treasury more than sufficient to meet the whole State indebtedness.

The auditor estimates the total receipts of the State for 1887 at \$208,277. Three fourths of this amount is composed of the following items: receipts from the Philadelphia, Wilmington, and Baltimore Railroad Company, \$40,000; from the Baltimore and Ohio Railroad Company, \$40,000; from licenses, \$80,000. The first two items are in commutation of taxes. In the third item is included a State tax on manufacturers. The receipts from licenses in 1886 were \$75,243, of which New Castle County contributed \$57,577.35, Kent, \$9,974, Sussex, \$7,692.

Legislative Session.—The General Assembly was in session from January 4 to April 22. It re-elected United States Senator George Gray for the full term of six years. Among the acts of the session were the following:

Authorizing the levy court of Sussex to fund \$30,000 of the county debt, at 4 per cent.

For the suppression of policy-gambling.

An act in relation to oysters, being a codification of most of the prior legislation on this subject, with some amendments.

To regulate the practice of medicine and surgery.

Reserving certain portions of the Delaware Bay for fishing and domestic oyster purposes.

Appropriating \$2,500 to pay for the right of way of the proposed canal connecting the Delaware Bay with Assawoman Bay.

Providing for the care of the indigent insane.

For the preservation of the health of female employés.

For the protection of fisheries [prohibiting the use of explosives or poison in streams and ponds].

For the protection of property from fire.

For the protection of public health and to prevent the adulteration of dairy products [the oleomargarine bill].

Relating to the revenues of the State [applying the State laws to the taxation of the Delaware Railroad, and empowering that road to commute for such State taxes by the payment of \$3,000 per year].

To regulate the practice of pharmacy.

Amending chapter 562, volume 14 [providing that no exemption of real property from attachment shall be allowed for claims of \$25 or less pertaining to wages for manual labor].

For the study of physiology and hygiene in the public schools, with special reference to the effects of stimulants and narcotics.

In relation to the education of colored children. Increasing the appropriation to \$6,000, and making other changes.

Supplement to the charter of the Delaware Railroad Company [authorizing a consolidation with the Delaware, Maryland, and Virginia Railroad and with the Eastern Shore feeders, and the absorption of the link between Rodney and Wilmington, with power to build a branch between Dover and Milford].

Empowering the State treasurer to collect claims against the United States Government on a commission of 25 per cent. of his collections. There are three of these claims. One for \$300,000, one for \$175,000, and one for an amount undetermined.

Concerning presidential electors [constituting the Superior Court of Kent County a tribunal for the hearing of contests between electoral candidates].

Accepting grants of money by the General Government for the establishment of agricultural experiment stations.

For the protection of minors [to keep boys under eighteen out of pool-rooms and similar places].

Regulating the conduct of caucuses and other primary elections. It provides that every election held by any political party, for the purpose of nominating or selecting candidates by ballot to be voted for at any subsequent election, or for the purpose of selecting delegates or representatives to any political convention, shall be held by one presiding officer and two judges at each voting precinct. These officers, as well as the clerk of the meeting, shall take a prescribed oath to perform their duties impartially. The procedure at such meetings is determined, and heavy penalties for fraud in the balloting or the counting of votes are fixed. The act applies to Newcastle County, which includes half the population of the State, and is especially directed against frauds in the city of Wilmington.

Railroad Taxes.—A decision rendered by the State Supreme Court in March had the effect of invalidating all city and county taxation of railroads. The question at issue arose upon the interpretation of the act of 1873, which permitted the Philadelphia, Wilmington, and Baltimore Railroad to commute all taxes by the payment of \$40,000 annually, the benefit of which had been extended by subsequent legislation to all railroads in the State. The court decided that this payment, under the words of the statute, was in commutation of all taxation, State, county, and city, on all classes of railroad property. As this result was not contemplated by the framers of the act, who had in view only commutation for State taxes, the Legislature nullified the future effect of the decision by an act permitting taxation by cities and counties of such property, the road-bed excepted. But all back taxes were lost.

Education.—A radical change was made in the public-school system of the State, by an act that vacates the offices of State superintendent and assistant superintendent of public schools, and substitutes therefor a superintendent for each county. These commissioners are to be appointed by the Governor, and to hold office for one year. By the same act the business of furnishing text-books for the schools was taken from the State, in whose hands it has proved a losing transaction.

The Delaware State College has been crippled in its work during the year by the hostility existing between its president and members of the faculty. The board of trustees has been unable to settle the difficulty, being itself near-

ly evenly divided between the friends and opponents of President Caldwell. At a meeting in July, the Caldwell faction succeeded in postponing action on the president's resignation till March, 1888. There is danger that this deep-seated quarrel may wreck the institution, which, at its best, has never had much prosperity.

The report of the State actuary of colored schools for the year ending July 1, shows that the work in these schools, though making little advance, is still equal to that of previous years. The total number of schools for the year was 70, an increase of one over the last report, and the total number of pupils 3,347.

Constitutional Convention.—The following is an extract from the bill passed by the Legislature on this subject:

Whereas, The subject of a convention to revise and amend the Constitution of this State has been agitated among the people; and, *whereas*, this General Assembly, without expressing any opinion as to the necessity of a convention, deems it to be right and proper to afford an opportunity to the people to make their sense known: *Therefore, be it enacted*, On the first Tuesday in November next a special election shall be held for the purpose of ascertaining the sense of the people of this State upon the question of calling a convention to change, alter, and amend the Constitution of the State.

The grounds of dissatisfaction with the present Constitution are numerous, the clauses giving each county, regardless of size, the same representation in the General Assembly, and providing that the whole county shall vote for all the Senators and Representatives nominated in each of its districts being especially objectionable. The election in November resulted in a vote of 14,450 in favor of the proposed convention, to 464 against; but, owing to a peculiar provision of the State Constitution, which requires that the vote to call a convention shall be a majority of the highest number of votes cast at any one of the last three preceding elections, the result was practically in favor of the anti-convention party. The negative vote was not a fine test of the strength of the latter party, as its members generally refrained from voting, in order to bring the total vote below the 15,640 votes required to make a decision possible. The present Constitution dates from 1830.

DENMARK. a constitutional monarchy in northern Europe. A new constitution was adopted on July 28, 1866. The representative and legislative assembly is called the Rigsdag, and consists of two chambers. The Landsting is composed of 66 members, of whom 12 are appointed for life by the King, and the rest are elected for eight years by indirect suffrage. The city of Copenhagen has 7 representatives; Bornholm, 1; the Faroe Islands, 1; and the electoral districts of the towns and rural communes, 45. The Folkething has 102 members, all elected directly for three years. The reigning sovereign is Christian IX, born April 8, 1818, who ascended the throne in 1863. The

heir-apparent is his son, Frederick, born June 8, 1843. The ministry is composed as follows: President of the Council and Minister of Finance, Jacob B. Scavenius Estrup, appointed June 11, 1875; Minister of Justice and for Iceland, J. V. M. Nellesmann; Minister of Foreign Affairs, Baron O. D. Rosenorn-Lehn, appointed Oct. 11, 1875; Minister of Marine, Rear-Admiral N. F. Ravn, appointed Jan. 4, 1879; Minister of Worship and Public Instruction, J. F. Scavenius, appointed Aug. 24, 1880; Minister of War, Colonel J. J. Bahnsen, appointed Sept. 12, 1884; Minister of the Interior, H. P. Ingerslev, appointed Aug. 7, 1885.

Area and Population.—The kingdom of Denmark has an area of 38,302 square kilometres, or 14,124 square miles. The population in 1882 was estimated at 2,018,432. In 1880 the population was 1,980,259, of which number 515,758 inhabited the towns, and 1,453,281 the country districts. The foreign-born population comprised 33,152 Germans, of whom 22,007 were natives of Schleswig; 24,148 Swedes; 2,823 Norwegians; 454 English; 384 Russians; 182 Austrians; 188 French; and 1,702 of other nationalities. The population of the capital, Copenhagen, on Jan. 1, 1887, was 289,900, inclusive of the suburbs.

The great majority of the inhabitants of Denmark adhere to the Lutheran or state Church. Of other denominations the Baptists in 1880 counted 3,687 adherents; the Roman Catholics, 2,985; the Mormons, 1,722; the Reformed Church, 1,868; the Irvingites, 1,086. There were 8,946 Jews, and 1,074 persons who professed no belief.

In 1880 there were 5,667 emigrants; in 1881, 7,985; in 1882, 11,614; in 1883, 8,376; in 1884, 6,807; in 1885, 4,346; in 1886, 6,628. Nearly all the emigration is to the United States.

The natural movement of population for the last three years reported has been as follows:

YEARS.	Marriages.	Births.	Deaths.	Surplus of births.
1883	15,462	66,392	39,323	27,071
1884	15,970	70,272	39,529	30,743
1885	15,645	69,517	39,053	30,464

Legislation.—The Rigsdag met on October 8. The Left was not present, but held a meeting at which Berg's radical proposals were rejected and the views of the moderate wing in favor of negotiating with the Government were approved. No compromise was reached, however, and the finance law decreed by the Government was rejected by 68 votes against 25. The Government thereupon promulgated another provisional finance law, under which it will collect the existing taxes and make necessary disbursements during the current year.

Finances.—The net receipts of the treasury from the various sources of revenue for the year ended March 31, 1886, were as follow: Domains, 570,177 kroner; forests, 200,437 kroner; reserve and invested funds of the state, 3,843,150 kroner; direct taxes, 9,517,682

kroner; indirect taxes, 34,272,258 kroner, of which 2,618,526 kroner were derived from stamped paper, 24,366,424 from customs, the tax on playing-cards, and the duty on beet-sugar, and 7,287,308 from various sources; the postal receipts, 224,543 kroner; telegraph receipts, 129,884 kroner; lottery, 884,622 kroner; receipts from the Faroe Isles, 63,206 kroner; other receipts, 4,271,366 kroner. The expenditure on the army amounted to 10,122,161 kroner, not including 1,572,038 kroner of extraordinary expenditure; on the navy, 6,142,674 kroner, besides 766,642 kroner of extraordinary expenditure; on the public debt, 9,550,758 kroner; on the financial administration, 3,059,822 kroner; on the Department of Justice, 2,969,918 kroner; on the Interior Department, 2,749,838 kroner. The budget for 1888-'89 places the receipts at 54,000,000 kroner, inclusive of a balance of 1,500,000 kroner in the treasury, and the expenditures at 56,000,000 kroner. On March 31, 1886, the internal debt amounted to 180,929,771 kroner, and the total debt to 194,895,438 kroner. The debt has since been reduced by 1,600,000 kroner through the payment of the Amsterdam loans of 1764 and 1785 and the Antwerp loan of 1788. This is offset by assets consisting of investments and securities amounting to 103,112,028 kroner, not including the capital of the Government railroads, telegraphs, and other reproductive public works.

The Army.—The regular army and reserve in 1887 numbered 1,201 officers and 41,749 men. The infantry mustered 801 officers and 33,192 men; the cavalry, 189 officers and 2,420 men; the artillery, 175 officers and 4,755 men; the engineers, 61 officers and 1,366 men. The second ban or extra reserve consisted of 294 officers and 16,818 men. The government asked in 1882 for an extraordinary credit of 72,000,000 kroner to be expended mainly in fortifying Copenhagen on the sea and land sides and in constructing fortresses and intrenched camps in other localities. The refusal of the Folkething to vote the supplies, and that of the ministry to resign in consequence of their defeat, led to a constitutional crisis, which is still pending.

The Navy.—The Danish war-fleet in 1886 consisted of 5 armor-clads of the first class, carrying 79 guns; 8 of the second class, carrying 28 guns; 7 cruisers, with 79 guns; 8 iron gun-boats, with 36 guns; and 7 first-class and 9 second-class torpedo-boats. The largest iron-clad is the "Helgoland," completed in 1880, a vessel of 5,345 tons displacement, which has 12 inches of armor at the water-line, and is armed with one 36-ton and four 22-ton guns. The "Tordenskjöld," a large torpedo-vessel, is armed with a single 50-ton gun, a 14-inch Krupp breech-loader, besides four 6-inch Krupps, light guns, and appliances for shooting White-head torpedoes. The "Valkyrien," a cruiser of 2,900 tons displacement, and protected with 24-inch steel deck-armor, was begun in 1886.

Commerce.—The total value of the imports in 1884 was 274,168,607 kroner; of the exports, 178,394,038 kroner. (The krone has an exchange value of about 15 cents). The commerce was divided among the following classes of commodities, the value being given in kroner:

CLASSES.	Imports.	Exports.
Articles of food	91,300,000	182,100,000
Raw materials	90,200,000	24,800,000
Manufactures	69,400,000	10,200,000
Machines, tools, and other means of production	23,300,000	11,300,000

The imports for 1885 are reported as 249,200,000 kroner, and the exports as 162,300,000, divided among the classes in the following proportion:

CLASSES.	Imports.	Exports.
Articles of food	84,500,000	118,300,000
Raw materials	83,600,000	23,300,000
Manufactures	63,800,000	10,300,000
Machinery and plant	16,500,000	10,600,000

The leading articles of import and the values imported in 1884 were as follow: Textiles, 89,744,768 kroner; iron and steel manufactures, 19,574,748 kroner; timber and manufactures, 18,088,406 kroner; coal, 14,489,286 kroner; wheat, 9,666,258 kroner; rye, oats, barley, Indian corn, and other cereals and flour, 22,186,402 kroner. The following are the values of the chief exports in 1884: butter, 81,570,879 kroner; hogs, 22,887,090 kroner; cattle, 21,938,800 kroner; pork products, 18,287,790 kroner; wheat-flour, 7,850,852 kroner.

In the total value of the imports in 1884 Germany is represented by 98,546,948 kroner; Great Britain by 62,662,078 kroner; Sweden and Norway by 40,070,370 kroner; Russia by 16,514,390 kroner; and the United States by 15,492,682 kroner. Of the total exports 68,449,668 kroner went to Great Britain, 57,754,682 kroner to Germany, 41,078,881 kroner to Sweden and Norway, and 3,590,195 kroner to the United States.

Navigation.—The Danish commercial marine consisted on Jan. 1, 1886, of 3,046 sailing-vessels, of 188,923 tons, and 281 steamers, of 89,815 tons; total number of vessels, 3,327; total tonnage, 278,738. The movement of navigation at Danish ports in 1885 was as follows: sailing-vessels entered (exclusive of 15,258 coasters, of 188,229 tons), 16,427, of 754,400 tons; sailing-vessels in the foreign trade cleared, 15,886, of 126,415 tons; steamers entered (exclusive of 12,105 coasters, of 260,872 tons), 10,371, of 1,004,609 tons; steamers cleared, 10,957, of 1,881,710 tons.

Railroads, Posts, and Telegraphs.—The railroad mileage in 1886 was 1,214. The Government lines had a total length of 1,000 miles, and cost up to March 31, 1886, 146,471,475 kroner. The receipts from the state railroads in 1885-'86 were 12,918,886 kroner, and the operating expenses 10,617,180 kroner.

In 1885 the number of letters sent through the mails was 36,724,663, including postal cards; circulars and printed matter, 8,423,862; journals, 41,885,557. The receipts in 1885-'86 were 4,273,209 kroner; the expenses 4,048,666.

The telegraph lines belonging to the Government had in 1885 a total length of 2,417 miles, with 6,757 miles of wire. There were 149 Government telegraph stations and 192 stations on the private telegraph lines belonging to the railroads. The number of paid messages forwarded on the state lines in 1885 was 1,261,468, of which 729,056 were domestic and 532,412 international. The receipts in 1885-'86 were 694,565 kroner; the expenses 824,399.

Iceland.—According to the Constitution of 1874, the lower chamber of the Legislature, called the Althing, consists of 24 members elected by the people, and the Landsting, or upper chamber, of 6 elected members and 6 chosen by the King. By virtue of a clause in the Constitution the Legislature has changed the proportion, making the number in the Althing 21, and in the Landsting 15, of which latter 9 are elected by the people and 6 nominated by the King. The Icelanders desire to have a resident ministry and an administration under the control of their Legislature, affirming that the minister for Iceland in Copenhagen, who directs the entire administration, is unable to understand the wishes of the people or to regulate the conduct of his subordinates. The area of the island is 39,756 square miles, but the inhabited portions contain only 16,180 square miles. The number of inhabitants in 1880 was 72,445, of whom 34,150 were males and 38,295 females. There has been distress in Iceland and considerable emigration in recent years.

Colonies.—The Danish West Indies are the only colonies of commercial importance. They have an area of only 118 square miles, but produce large quantities of rum and sugar. The portions of Greenland that are free from ice have an area of 83,800 square miles. On Dec. 31, 1885, Northern Greenland had 4,414 inhabitants, of whom 2,119 were of the male and 2,295 of the female sex; and Southern Greenland, 5,600 inhabitants, of whom 2,557 were males and 2,943 females.

DEPRÉTIS, AGOSTINO, Italian statesman, born in Stradella, Piedmont, in 1811; died there, July 29, 1887. After completing his studies at the University of Turin, he began the practice of law in his native town. He took part in the agitation against Austrian rule, and by that course injured his professional prospects, so that he was compelled to abandon legal practice, and took the management of the large estate of the Gazzaviga family. He participated in the unsuccessful rising at Milan, but afterward played no part in the military events of the Italian revolution. In 1850 he was elected to the Sardinian Parliament as deputy from Broni, and afterward sat for Stradella. Originally he was an opponent of Cavour, but became his supporter when the National move-

ment had taken definite form. In 1859 he was appointed Civil Governor of Brescia, and in 1860 he went to Sicily as commissary-general and pro-dictator to carry into effect the union with Italy by proclamation of the statute. Garibaldi had requested his appointment to this post, but Cavour trusted him to check any dangerous revolutionary developments, and for that purpose provided him with a royal commission as governor-general. Although a member of the Radical party, and at various times the leader of the parliamentary Opposition against Cavour, he always maintained cordial personal relations with that statesman. In 1862 he entered the Ratazzi Cabinet as Minister of Public Works. In 1866 he was Minister of Marine in the Cabinet presided over by Ricasoli, and in 1867 Minister of Finance when that statesman was again at the head of the Cabinet. After the death of Ratazzi he became chief of the Opposition, and when the Minghetti Cabinet fell under the assaults of the Left, he was called, in March, 1876, to the head of the Government. He abolished the grist-tax, and carried through a bill prohibiting religious processions outside of churches, because such processions took the character of political manifestations. In March, 1878, his ministry was overthrown by a combination led by Cairoli, but that minister, who was singularly deficient in parliamentary management, soon succumbed to the tactics of Deprétis, who returned to power in the following December. The new Cabinet was a surprise to Parliament, and its composition indicated his desire to cut loose from the Radicals, and attach to himself the moderate members of both parties. He left out all the able and ambitious men of his party, and chose for his colleagues persons of no ministerial experience, and not identified with the aims of the Left. This was the beginning of the "transformism" with which his name was thereafter coupled, and which his enemies among the Radicals described as going in as Minister of the Left and governing as Minister of the Right. His Cabinet lasted only six months, but not long after its defeat he was again called to the helm, and after that he remained the "indispensable" prime minister. While alienating the extreme Radicals, and being as often opposed as he was supported by the various groups of the Left and their leaders, he preserved a shifting parliamentary majority, usually a large one, by his political sagacity and parliamentary tact. He was virulently abused by the extremists of both parties, but won the confidence of a great section of the voters, was supported by Minghetti and others of the old Conservatives, and by making concessions that did not involve the sacrifice of his patriotic aims, he governed almost as a dictator, shaping the foreign and domestic policy of the kingdom during a long and critical period. His political manifestoes, which he was accustomed to date from Stradella, were effective electioneering documents.

The legislation that he originated was not such as to gain him the reputation of a creative statesman, but he carried through reforms at a rate sufficient to satisfy the progressive spirit of the bulk of the nation. In 1882 he extended the franchise, established *scrutin de liste*, and secured the passage of a bill confirming the use of the parliamentary oath. In 1883, by a coalition with the Right, he carried through a repressive law against socialism. He differed with the other members of the Cabinet on the question of an education bill, and resigned, but formed a new ministry. In the early part of 1887 the disaster at Massowah led to the most violent recriminations in the Chamber, and the reconstruction of the Cabinet, into which Crispi, long an assailant and rival of Deprétis, was taken, possibly with a view to the succession, for the health of the "old man of Stradella," always vigorous up to this year, was now broken, and he wished to retire, but was persuaded by the King to remain in office. Deprétis was not a great orator, but was skillful in debate, and possessed the art of disarming his enemies by ready explanations, and warding off savage attacks with smooth and conciliatory phrases. He was often accused of political trickery and insincerity, but never of selfish or unpatriotic motives. The policy of turning from Republican France to form an alliance with the conservative monarchies of central Europe, which was the chief political act of his life, offended the democratic instincts of Italian Liberals, and disappointed the ambitious hopes that were entertained of territorial aggrandizement; yet the country has since accepted the league with Germany and Austria as a safeguard for the security, dignity, and best interests of Italy.

DISASTERS IN 1887. The year's record of disasters is notable for the variety of ways in which life has been cut short and property destroyed. This is due in part to the more rapid means of transit by land and sea, and in part to the increase of telegraphic facilities all over the world. The following list, while far from complete, presents a startling record of the perils that surround every dweller in a civilized land. It is to be observed that the terrible possibilities which seem to threaten mankind from the common use and manufacture of high explosives are not as yet realized; gunpowder is still more destructive than dynamite, and together they fall far short of the railroad and the steamboat.

January 4. Railway: broken axle near West Springfield, Mass., 1 killed, 19 injured; collision near Republic, Ohio, wreck took fire, 13 killed. Explosion in a coal-mine at Mons, Belgium, 37 killed.

8. Shipwreck: German ship *Elizabeth*, near Cape Henry, 27 lives lost, including 5 of the life-saving crew.

9. Fire: the Alcazar palace at Toledo, Spain, totally destroyed, loss \$1,000,000.

11. Railway: train derailed near Dunbar, Nebraska, probably the result of malice, 1 killed, 19 injured.

17. Car-load of cotton burned near Paducah, Ky., bodies of 4 supposed tramps found.

18. False alarm of fire in a London theatre, 17 killed in the panic.

20. Collision at sea: British emigrant ship *Kapunda* sunk by bark *Ada Melmore* off Brazilian coast, 800 lives lost.

21. Shipwreck: British steamer *Brentford*, 23 lives lost. Fire: hotel in New Westminster, B. C., 3 lives lost.

22. Shipwreck: Chinese transport, 100 lives lost.

24. Floods in Queensland, many lives lost. Shipwreck: American schooner *C. Graham*, on Shad Bay Shoals, all hands lost.

25. Railway: collision at Allandale, Ontario, 5 injured. Explosion: powder-car near Fort Scott, Kansas, many buildings demolished and several lives lost.

31. Explosion: dynamite on American steamer *Guyandotte*.

February 2. Railway: train derailed by snow near Garrison, Mont., 1 killed, 10 injured.

5. Train derailed near White River Junction, Vt., cars took fire, 30 killed, 37 injured.

7. Train derailed through malice, near Charlotte, N. C., 2 killed.

8. Collision near Dubois, Ga., 2 killed, 2 injured.

12. Collision near Port Huron, Mich., a brakeman was killed while trying to prevent the collision.

18. Fire: 30,000 bales of cotton at Tompkinsville, Staten Island, N. Y. Railway: broken bridge near Mud Lake, Ill., 1 killed, 1 injured.

22. Train derailed near Bloomer, Wis., 4 injured; train derailed by snow near Tamarack, Cal., 1 killed; car-heater exploded near Sidney Station, Ill., fire followed, several passengers injured.

28. Earthquake in Southern Europe, much damage in the Riviera, nearly 400 lives lost. Railway: collision near Red Oak, Iowa, 1 killed, 2 injured.

26. Earthquake in Italy. Railway: collision near Seymour, Iowa, 1 killed, 1 injured.

27. Broken bridge near The Needles, Cal., 3 killed, 4 injured.

28. Collision near Grafton, West Va., 1 killed, 2 injured.

March 1. Explosion in the Beaubrun mines, St. Etienne, France, 86 killed. Fire: steamer *W. H. Gardner* burned on Tombigbee river near Gainesville, 20 lives lost. Shipwreck: Chinese junk between Hainan and Siam, 600 lives lost. Railway: train buried in snow near Selkirk, Canada, 7 killed. Fire: American steamer *Lone Star* burned at her wharf in New York city.

5. Explosion: fire-damp in coal-mines near Mons, Belgium, 144 lives lost. Railway: broken bridge near Victoria, Mo., 2 drowned, 2 injured.

8. Railway: train derailed near Hightstown, N. J., 1 killed, 5 injured.

10. Explosion of melinite in the French arsenal at Belfort, 6 killed, 11 injured.

12. Railway: collision near Wheatland, Dakota, 1 killed, 2 injured.

18. Earthquake in Southern Europe. Train derailed near Hunt's Station, Ohio, several injured.

14. Railway: bridge breaks near Boston, Mass., 24 killed, 115 injured.

16. Railway: collision in Rochester, N. Y., 4 injured; broken bridge near Dunbar, Ohio, 3 killed; train derailed near Park's Station, N. Y., 15 injured, wreck took fire.

18. Fire: Richmond Hotel burned in Buffalo, N. Y., 10 lives lost, many injured.

19. Railway: collision near Toledo, Ohio, 5 injured.

23. Fire: 12 lives lost at Bessemer, Mich. Explosion in colliery near Sidney, New South Wales, 70 killed.

24. Fire: temple burned, China, 260 lives lost (supposed incendiary.)

25. Railway: collision near Leetonia, Ohio, 1 killed, 7 injured.

26. Collision near Rockport, Pa., 1 killed, 2 injured.

31. Explosion: shells fired in target-practice by U. S. S. *Omaha*, found by Japanese peasants and accidentally exploded, 4 killed.

April 1. Railway: collision near Middleton, Miss., 2 killed, wreck caught fire.

2. Collision near Springfield, Ont., 2 killed.

3. Fall of a church at Linguaglossa, Sicily, 40 killed. Explosion in mine near Venita, Ind. Ter., 18 killed.

6. Fire: 60 horses burned at Buchel, Switzerland.

7. Land-slide at Monte Carlo.

8. Train derailed near Bismarck, Dakota, 2 killed, 8 injured.

12. Collision near Lancaster, Ohio, 1 killed, 6 injured. Fire in St. Augustine, Fla., several historic buildings and two hotels burned.

13. Train derailed near Ravenswood, West Va., 3 killed, 6 injured. Shipwreck: British steamer *Victoria*, at Dieppe, 12 lives lost.

16. Shipwreck: French steamer *Dieu Mer* capsized and sank almost instantaneously off Cape Nassau, 3 drowned.

17. Railway: collision near Palatine, Ind., 5 killed.

18. Railway: land-slide near St. Johnsville, N. Y., 1 killed, 1 injured. Collision near Diamond Bluff, Wis., 1 killed, 8 injured. Shipwreck: steamer *Tasmania* and *Volta*, in the Mediterranean, about 30 lives lost.

20. Train derailed near Taswell, Ind., 3 killed, 2 injured.

21. Tornado in Missouri and Arkansas, 15 lives lost. Shipwreck: schooner *Active*, off the coast of Oregon, 33 lives lost. Railway: collision near Chelsum, Washington Ter., 6 killed, 18 injured. Earthquake in the island of Jersey.

22. Hurricane off the Australian coast. Pearl-fishing fleet wrecked, 550 lives said to be lost.

23. Railway: broken bridge near Winslow, Arizona, 3 killed. Another broken bridge, near Hoffman, Ind., 3 injured.

24. Fire at Arnaut-Keire, Asia Minor, 500 houses burned, many lives lost.

25. Explosion: an old artillery shell, near Harper's Ferry, Va., burst in the midst of a picnic-party, 6 injured.

27. Railway: train derailed near Timberville, Va., 1 killed, 1 injured. Train derailed by running over two tramps lying on track, both killed.

28. Shipwreck: Schooner *Flying Scud*, in Shelikoff strait, 17 lives lost. Mining accident at Pottsville, Pa., 5 lives lost.

29. Shipwreck: British steamer *Benton* foundered off Formosa, 150 lives lost; steamer *John Knox* lost, with all hands, off Cape Ray. Steamer *Benhope* burned off Tybee island, Georgia.

30. Railway: train derailed near Driscoll, Dakota, 1 killed, 7 injured. Collision near Tamaqua, Pa., 1 killed, 2 injured.

May 1-7. Hot sirocco in Hungary with fires, many lives lost, property destroyed to the value of \$2,500,000.

3. Earthquakes in Arizona and Mexico, towns destroyed, and 150 to 200 lives lost. Explosion in a mine near Nanaimo, British Columbia, 125 lives lost.

4. Explosion in Coosa tunnel, Georgia, 12 killed.

7. Explosion: powder-mill near Pittston, Pa., 1 killed, 3 injured.

8. Collision at sea: 10 Italian emigrants lost from steamer *La Champagne* off the French coast.

19. Collision at sea between British steamers *Britannio* and *Celtic*, 5 killed, 6 injured—cause, fog.

25. Fire: the Opera Comique, in Paris—estimated loss of life nearly 200.

27. Fire: stables of Belt Line Horse-Car Co., New York city, 1,200 horses suffocated.

28. Explosion in a mine, Lanarkshire, Scotland, 75 killed. Explosion in a colliery near Glasgow, Scotland, 75 killed. Shipwreck: British steamer *Sir John Lawrence*, in a typhoon in the Indian Ocean, 750 lives lost.

June 4. Explosion in Cambria Iron-Works, 9 lives lost.

5. Fire and panic in a circus at Neaschen, Germany, many killed, about 800 injured.

8. Explosion: fire-damp in a colliery in Westphalia, 50 killed.

10. News of earthquakes in Turkistan, more than 100 lives lost.

17. Fire: American steamer Champlain burned off Grand Traverse Bay, 22 lives lost.

18. Drowning: nearly 250 pilgrims drowned in the Danube by the upsetting of a boat near Pak.

22. Shipwreck: British ship Dunskeig, off Terra del Fuego, part of the crew perished.

24. Fire in a mine near Virginia City, Nevada, 15 lives lost.

July 2. Railway: collision at Lamonte, Mo., 1 killed, 3 injured; broken axle near St. Thomas, Ont., 3 killed.

3. Train derailed near St. Thomas, Ont., 2 killed.

4. Explosion: dynamite at Jasz-Berény, Hungary, 27 killed. Railway: collisions near Birmingham, Ala., 7 injured; and near Bessemer, Mich., 5 injured, cars caught fire. Accidents and fires, too many for enumeration, caused by fireworks.

5. Explosion of dynamite near Pesh, 27 soldiers killed. Railway: misplaced switch near Galt, Ont., 8 injured, probable carelessness.

6. Train derailed near Leon, Ky., 8 injured. Landslide at Zug, Switzerland, about 100 killed and the town nearly destroyed.

9. Fire: Alcazar theatre at Hurley, Wis., 15 lives lost.

10. Shipwreck: sloop Mystery capsized in Jamaica Bay, N. Y., 24 lives lost; steamer Merrimac lost on Little Hope reef near Halifax.

11. Railway: collision at Lapeer, Mich., 4 injured. Fire in Hurley, Wis., 11 lives lost.

13. Collision near Robinson's, Ky., 1 killed, 5 injured. Explosion: locomotive engine at Crawford's, Pa., 2 killed, 9 injured.

15. Railway: collision near Lincoln, Neb., 2 engines and 13 cars destroyed, no lives lost, but noteworthy because all hands were asleep on one of the engines; another collision at St. Thomas, Ont., between an excursion train and an oil-car, fire followed, 13 killed, more than 100 injured.

16. Railway: engine of the President's special train broke a parallel rod near Glendale, N. Y., engineer killed.

20. Fire: Standard Oil Company's works at Constable Hook, N. J., loss \$1,500,000.

21. Eleven railway-laborers run over and killed near Hohokus, N. J.

22. Shipwreck: British ship Firth foundered in a cyclone off the coast of Java.

23. Shipwreck: British steamer Mahratta foundered off Hoogly Point, India, many lives lost.

24. Railway: misplaced switch near Pittsburg, Pa., 8 injured, probable carelessness.

26. Railway: train derailed near Wabash, Ill., 1 killed, 2 injured.

27. Railway: collision near Hopedale, Ill., 9 killed, 15 injured; derailment near Franconia, Ariz., fire resulted, 3 killed.

28. Derailment and broken bridge near Cumberland, Md., 3 killed; collision at Knob Lick Mountain, Mo., 3 killed.

29. Train derailed near Tioga, Tex., 4 injured; broken axle near Cochrane, Ind., 2 killed, 2 injured.

30. Railway: collision at Lawrens, Ohio, 8 injured; another at Hookset, N. H., 2 killed, 5 injured; train derailed near Farmersville, Texas, 7 injured.

31. Car upset at Dedham, Mass., 7 injured.

August 2. Railway: collision near Devil's Lake, Wis., 2 killed, 3 injured.

3. Collision near North Bend, Neb., 2 killed.

4. Train derailed near Greenwood, Va., 1 killed, 8 injured. Tornado in Kansas, 79 houses destroyed in Millbrook.

5. Railway: collision near Milton, Ont., 1 killed.

6. Train derailed near Bangor, Ala., 1 killed, 2 injured.

8. Collision near Chattanooga, Tenn., 2 killed, several injured; misplaced switch near Missouri City, Mo., 2 killed.

9. Train derailed near McCoy's, Ind., 1 killed; collision near White Hill, N. J., 1 killed, 4 injured.

10. Railway: excursion train breaks through a burning bridge near Chatsworth, Ill., 80 killed, from 150 to 250 injured; train derailed near Duff Station, Ind., 5 injured.

11. Fire at sea: British steamer City of Montreal burned, all hands rescued by steamer York City. Railway: train derailed near Albany, Ga., 15 injured. Explosion: Giant Powder Works, near San Francisco, Cal., 1 killed, 10 injured.

12. Fire in Pittsburg, Pa., loss \$500,000. Railway: train derailed near Saline City, Ind., 6 injured.

13-20. Run over at grade-crossings in Connecticut, 9 persons.

13. Collision near Greenville, Pa., 3 injured.

15. Wind-storm in France destroyed much property.

17. Four fatal accidents to Alpine tourists reported from Zurich, making 18 within a month. Railway: collision near Ellicott City, Md., 3 killed; train derailed at Washington, D. C., 1 killed, 17 injured.

18. Tornado in Nebraska, houses blown down, 2 persons killed, 6 injured.

20. Railway: collision near Athens, Tenn., 1 killed, 1 injured.

21. Train derailed near Sangus, Cal., 5 injured.

22. Drowning: accident at a regatta on the Thames, England, 17 lives lost.

23. Railway: train derailed near Skelly's Station, Ohio, 1 killed, 3 injured; collision near Culpeper, Va., 2 killed, 4 injured; collision near Round Bay, Md., 1 killed; collision near Woodbine, Md., 1 killed, 1 injured.

24. Collision near Eaton's Siding, W. Va., 2 killed, 17 injured; broken bridge near Denver, Col., 2 killed, 2 injured.

26. Railway: collision near Chattanooga, Tenn., 25 injured.

28. Collision near Port Byron, N. Y., 1 killed, 2 injured.

31. Collision at St. Paul, Minn., 2 injured. Cholera: official returns show 30,780 fatal cases in the Northwestern provinces of India during the month of August.

September 2. Railway: train derailed near Lawrence, Kan., 2 killed, 1 injured; train derailed near Parsons, Kan., 1 killed, several injured.

4. Shipwreck: British ship Falls of Bruar, foundered off Yarmouth, Eng., 24 lives lost.

5. Fire: a theatre burned in Exeter, Eng., 46 lives lost. Railway: collision near Fitchburg, Mass., 2 killed, 1 injured.

6. Explosion of a locomotive engine near Sherman, Texas, 2 killed.

7. Railway: collision near Aston, Ia., 1 killed, 9 injured.

8-9. Heavy rains in Arizona destroyed 25 miles of railroad, and did much damage otherwise.

12. Railway: collision at Peoria, Ohio, 2 killed, 1 injured.

16. Collision near Doncaster, Eng., 28 killed, 70 injured.

19. Collision on elevated road in Brooklyn, N. Y., 7 injured; another collision near Dubuque, Ia., 5 killed, 6 injured; train derailed near Fern, Ind., 2 killed.

20. Collision near Canton, Dak., 3 killed.

21. Hurricane in Texas; many houses and crops destroyed. Shipwreck: steamer Romeo at Villeguier, 13 lives lost.

25. Railway: misplaced switch near Holden, Mo., 2 killed, 1 injured.

26. Collision near Summit, N. J., 2 killed, 6 injured.

27. Train derailed near Jackson, Tenn., 2 killed, 3 injured.

28. Flood: the Yellow River, in the Chinese province of Honan, overflowed its banks and submerged an area of 7,000 square miles, including many populous towns. Many thousand lives lost, and several million people left homeless.

30. Railway: collision near Park Station, Mo., 5 injured.

October 2. Earthquake in Smyrna.

3. Railway: collision near Hillsdale, Pa., wreck took fire, 1 killed; another collision near Dunsmuir, Cal., 1 killed, 4 injured; another collision near Lower Soda Springs, Cal., 1 killed, 8 injured; train derailed near Porter, Ark., 1 killed, 2 injured; another train derailed near Gladstone, Mich., 2 killed. Shipwreck: steamer California, on Lake Michigan, 14 lives lost.

4. Storm on the Great Lakes, 15 lives lost.

9. Shipwreck: British gunboat Wasp, supposed to have been lost at sea with all on board, 80 in number.

10. Railway: collision near Kout, Ind., 10 killed, many injured. Shipwreck: French steamer, in the Bay of Bormes, 22 lives lost.

12. Fire: an asylum for the insane burned at Cleveland, Ohio, 8 women perished.

14. Fire: cotton-mills burned in Baltic, Conn. Estimated loss \$1,500,000; 1,000 persons thrown out of work.

17. Fire: at Hankow, China, 2,000 lives lost, 2,000,000 taels' worth of property destroyed.

18. Shipwreck: collision between steamer Upupa and German bark Planteur off Beachy Head, 12 lives lost.

20. Shipwreck: British steamer Cheviot at Port Philip, 12 lives lost. Railway: collision at Green's Station, S. C., 8 killed, 10 injured; train derailed near St. Alban's, W. Va., 26 injured.

21. Collision near Whiteside, Tenn., 2 killed, 1 injured.

22. Fire: town of Kitab, Bokhara, destroyed; nearly half the inhabitants perished.

27. Railway: trains derailed near Florissant, Col., 3 killed; another near Tallahassee, Fla., 5 injured.

28. Train derailed near Morris, Ill., 2 killed, 1 injured. Probably caused by malice.

30. Shipwreck: American steamer Vernon on Lake Michigan, 40 lives lost.

November 8. Railway: derailment and collision in St. Louis, Mo.; circus train wrecked, and a number of wild animals escaped, 1 man killed, several injured.

15. Explosion: locomotive engine near Palatine Station, N. Y., 1 killed, 2 injured. Fire: steamer Wah-Yueng burned in Canton river, China, about 400 lives lost.

17. Fire: 8 locomotives and 150 cars destroyed at Ludlow, Ky.

18. Railway: train derailed near Paducah, Ky., 3 killed, 8 injured.

19. Shipwreck: sunk by collision off Dover, German steamer Scholten, 112 lives lost.

20. Railway: collision near Tunnel Hill, Ill., 4 killed. Fire: winter quarters of Barnum's menagerie burned, many valuable animals lost.

21. Explosion: powder magazine at Amoy, China, 50 soldiers and several hundred civilians reported killed, and a large portion of the town destroyed.

25. Railway: collision near Williams, Ariz., 3 killed, 18 injured; collision near Cochran's Mills, Pa., 3 killed, 5 injured.

December 1. Fire: Strobridge Lithographing Company's buildings burned in Cincinnati. Earthquakes in Sonora, Mexico; much suffering among the inhabitants.

4. Flood: a heavy ocean-wave swept the coasts of Cuba and Porto Rico; many huts and houses destroyed. Earthquake in Calabria.

9. Shipwreck: 20 fishing-smacks lost off the Orkney Islands.

16. Collision between steamer Breakwater and ferry-boat Pavonia in New York harbor, many passengers injured.

18. Shipwrecks: several vessels driven ashore on the North Atlantic coast, 1 life lost.

20. Fire at sea: American steamer San Vincent off San Francisco, 11 lives lost.

22. Explosion: a large quantity of naphtha accidentally discharged into the main sewer in Rochester, N. Y.; explosions and fire followed, several large buildings burned, 4 men killed, 8 missing, and about 90 injured.

23. Explosion: dynamite near Halifax, N. S., 4 killed. Railway: collision near Chicago, 40 injured, 7 of them seriously; collision near Fairfield, Wis., 2 killed, 20 injured.

26. Railway: accidents in Pennsylvania and the District of Columbia, 4 killed.

27. Shipwreck: 25 vessels wrecked in the Gulf of Patras.

29. Shipwreck: scow capsized in New York harbor, 3 men drowned.

31. Explosion in works of Equitable Gas Company, New York city, shock felt throughout the vicinity, cause unexplained, 1 killed. Railway: collision near Greenwood, Ky., 6 killed, 21 injured; the wreck took fire. Another collision near Meadeville, Pa., 6 killed, 11 hurt; several minor accidents occurred, resulting in 3 killed and several injured.

DISCIPLES OF CHRIST. The "Churches of Christ" are not officially represented in any general body, but a considerable proportion of them are in relation through voluntary action by means of the organizations for missionary and benevolent work which meet with the General Christian Missionary Convention.

The twelfth annual General Christian Missionary Convention met in Indianapolis, Ind., October 8. The Convention consists virtually of the annual meetings of three distinct and independent organizations—the Christian Woman's Board of Missions, the Foreign Christian Missionary Society, and the General Christian Missionary Convention, each of which occupies one day of the session in the order in which the names of the bodies are given. The Christian Woman's Board of Missions returned receipts of \$26,226, or \$5,000 more than the receipts of the previous year: a membership of 12,506 persons; and 870 auxiliaries, bands, and young people's societies. The receipts of the Foreign Missionary Society had been \$47,758, and the expenditures had been \$47,598. Reports were presented from missions in Turkey (5 stations), Denmark, England (7 churches), India, Japan, and China, in all of which a net gain of 502 members was returned. The whole number of members in Turkey, India, and Japan was 855. The mission in Paris, France, had been discontinued in accordance with the direction of the society at its previous meeting. Complaints made by missionaries of other societies that the agents of this body had interfered with their missions in Turkey were declared not founded in reason, and the explanation was made that there had been no interference with other denominations except of that accidental character which could not be avoided. The receipts of the General Christian Missionary Society, which takes charge of home mission and church extension enter

prises, had been \$25,772. Under its direct agency 86 new and unorganized places had been visited, 158 churches had been visited and assisted, 25 churches had been organized, and 673 persons had been received by baptism. Several State organizations co-operate with the work of the society through their own agents. They returned in all 179 missionaries, who had visited and assisted 1,204 churches and 811 new and unorganized places, had organized 78 churches, and had received 5,915 members by baptism. The amount of \$79,828 was returned as raised by State boards, and about \$40,000 as raised by missionaries for local work. The receipts for the church extension fund had been, regular, \$987; special, \$2,286. Two loans had been made. A favorable report was made of the condition of the Southern Christian Institute, and of the school at New Castle, Ky. Two ministers had been aided from the Ministerial Relief Fund. A reply was adopted to a communication from the Commission of the Protestant Episcopal Church on Christian Unity, inviting a conference on that subject. It expressed gratification that such an invitation had been sent out. The "Churches of Christ," it represented, had been organized in the beginning in 1809, in an effort to restore the faith and discipline of apostolic times, in protest against the sectarian spirit, and were still, with about 800,000 communicants, seeking the same objects. A specification followed of what these churches regarded as essential to Christian unity. First, was the recognition of the Holy Scriptures of the Old and New Testaments as the revealed Word of God and the only authoritative rule of faith—the only one "beyond the reach of compromise or surrender." Second, the restoration of unity demanded a return to New Testament teaching; and this involved the points that the original, inspired creed had but one article, viz.: "Jesus is the Christ, the Son of the living God"; that all who confessed this faith in the Lord Jesus were admitted to

Christian fellowship by an immersion in water in the name of the Father, and of the Son, and of the Holy Spirit, and only such were admitted; and that those who were thus added to the Church were continued in fellowship so long as they walked in the commandments of Jesus. Outside of that which is essential to Christian unity, the answer continued,

There are many things pertaining to growth in knowledge, to methods of working, etc., in reference to which, for the sake of peace and for the preservation of unity, there should be a common agreement. There should, we think, be the largest liberty of opinion, of investigation, and of utterance, on all questions arising out of the study of the Scriptures, and no one who holds to Jesus "as God manifest in the flesh," and who keeps his commandments, should be disturbed in his church relations on account of his opinions, *provided* he does not attempt to force his opinions on others, or to make an acceptance of them a test of fellowship. Should he attempt this, he becomes a factionist, to be rejected after the first and second admonition. Many questions unprofitable for discussion in the pulpit, may be profitably, or at least harmlessly, discussed in the schools, to which all speculative questions should be remanded. Then there are practical questions—questions of method in carrying out the work of the Church—which, being left to the discretion of Christians, to be answered according to times and circumstances, should never be made tests of fellowship or occasions of strife.

Finally, the "reply" commended the declaration of the commission that the church which it represented did not seek to absorb other communions, but rather, co-operating with them on the basis of a common faith and order, to discountenance schism, heal the wounds of the Body of Christ, and promote Christian charity; and added, "not what will promote the interests of any denomination, but what will serve the purposes and promote the welfare of the 'one Body' of Christ, is to be sought. All other communions should adopt this sentiment as their own, as a necessary preliminary to all successful efforts to heal divisions and make manifest that unity which is so prominent a characteristic of the Church of God."

E

EADS, JAMES BUCHANAN, an American engineer, born in Lawrenceburg, Ind., May 23, 1820; died in Nassau, N. P., Bahama Islands, March 8, 1887. He attended school until he was thirteen years of age, and from his earliest youth showed great fondness for machinery, spending his spare moments in visiting places where he could watch the movements of mechanical appliances. In 1833 he accompanied his parents to St. Louis, and, as they reached that place, the steamer took fire, destroying all of their household goods. The boy then obtained a clerkship in the dry-goods house of Williams and Durings, and his evenings during this time were spent in the library of his employer, studying mechanical and civil engineering. In

1838 he became a purser on a Mississippi steamboat. This occupation afforded him the opportunity of studying the details of the construction of steamboats, and while so employed he acquired the title of captain, which clung to him through life. His experience led him to devise means for the saving of wrecks that were found along the river, and in 1842 he built a diving-bell boat for recovering cargoes. This proving successful, he constructed a much larger boat, with novel and powerful machinery for pumping out the sand and water, and lifting the entire hull and cargo. Forming a copartnership with Case and Nelson, he began the business of raising vessels, and soon extended his operations from Balize, La., to

Galena, Ill., and into the tributaries of the Mississippi. While engaged in this business he gained a knowledge of the laws that govern the flow of silt-bearing rivers, and it is said that there was not a stretch in the bed of the

JAMES BUCHANAN EADS.

Mississippi fifty miles long between St. Louis and New Orleans on which he had not stood on the bottom of the stream beneath a diving-bell. In 1845 he disposed of his interest in this business and built the first glass-works in the Mississippi valley. This proved unsuccessful financially, and he resumed the wrecking business. In 1845 twenty-nine steamers were burned at their landings in St. Louis, most of which were raised by him, so that in 1859 he had paid off his losses and acquired a fortune of \$500,000. He made a proposition to Congress in 1856 to keep the channels of the Mississippi, Missouri, Ohio, and Arkansas rivers clear of snags, wrecks, and other obstructions for a term of years; but the bill giving him the contract, after passing the House, was not acted on by the Senate. Impaired health led to his retirement from business in 1857, but in 1861, soon after the fall of Fort Sumter, he was summoned to Washington and consulted by the President and his Cabinet relative to the practicability of using light-draught iron-clad vessels on the Mississippi and its tributaries. Almost immediately a contract was given to him for the construction of eight iron-clad steamers, fully equipped, to be completed within sixty-five days. The timber to form their hulls was still uncut, the rolls for the manufacture of the armor-plates were not in existence, and the engines were nothing but pig-iron and bars; yet in forty-five days the "St. Louis," the first American iron-clad, was launched. The remainder of the fleet followed in quick succession, and with them the capture

of Fort Henry was accomplished, followed by the conquest of Fort Donelson and Island No. 10. In 1862 he designed and built six turreted iron vessels, all heavily plated. The turrets on these were different from those of Ericsson and Coles, and the guns were worked entirely by steam. In this way the 11- and 15-inch guns could be loaded and discharged every forty-five seconds, and this record stands as the first application of steam in manipulating heavy artillery. These boats proved of great service in the campaigns of Gen. Halleck and Grant. From 1867 till 1874 he was engaged in the construction of the great steel-arch bridge across the Mississippi at St. Louis. In the execution of this work, Mr. Eads had to do with problems that had never before been met by engineers. The bridge consists of three arches, of which the central one has a clear span of 520 feet, and is recognized as "the finest specimen of metal-arch construction in the world," while the side arches are 502 feet each in span. The granite piers all rest upon the bed-rock underlying the river deposits. Two are much deeper than any built at that time, and one, weighing 45,000 tons, was sunk to bed-rock, 186 feet below high-water mark, through 90 feet of sand and gravel, while the other, weighing 40,000 tons, is founded on rock 180 feet below high-water mark. It was opened on July 4, 1874, after an expenditure of exactly \$4,586,729.99. Mr. Eads then turned his attention to the deepening of the mouth of the Mississippi by means of jetties. His plans, which were strongly opposed by the engineers of the United States Army, to whom the matter was referred by the Government, were submitted to Congress, and finally a bill was passed granting him permission to attempt the improvement of the South Pass. Work was begun in the summer of 1875, and four years later the inspecting officers reported that a maximum depth of 80 feet had been secured, and the least width of the 26-foot channel was 200 feet, where previously the maximum depth had been but 9 feet. The jetties extend from the land's end at the mouth of South Pass about 2½ miles out over the bar and into the gulf. They are parallel, and are built of willow mattresses sunken by stone, and capped near the sea-ends with massive concrete blocks, the largest of which weigh 265 tons, and were, at the time they were put in position, the largest blocks ever placed on sea-walls. The character of this work, its great importance to the commercial interests of the country and the world, its successful accomplishment, the continued maintenance of the deep and wide channel that the works created, the difficult engineering problems that were so successfully solved, placed Mr. Eads among the first of hydraulic engineers. Meanwhile, he outlined one of the grandest plans ever undertaken by hydraulic engineering, having for its object the extension of the deep-water from the Gulf of Mexico to the

mouth of the Ohio. This magnificent channel was to be made permanent by putting an end to the caving of its banks. In 1879 Congress authorized the creation of the Mississippi River Commission, to consist of seven members, of which Mr. Eads was one. The jetty system was adopted, and two reaches of the Mississippi—Plum Point, twenty miles long, and Lake Providence, thirty-five miles long—were selected for improvement. The low-water depth of the former was only five feet, while the latter, 400 miles farther down the river, had a depth of nearly six feet. Permeable contraction works, similar to those used at the South Pass, were put in position in one season in the period between two floods, and the effect produced by the works during the first flood that followed was marvelous. The depth was increased through the upper reach to twelve feet at low water, and through the lower reach to fifteen feet, and scores of millions of cubic yards of sediment were deposited behind the permeable works, through the checking of the current. New shore-lines of an approximately uniform width were developed; but later Congresses refused to continue sufficient appropriations, although enough had been accomplished to show the entire practicability of the plan. Mr. Eads examined and reported on the bar at the mouth of the St. John's River, Fla., in 1878; on the improvements of Sacramento river in 1880; on the harbor of Toronto, Canada, in 1881; on the ports of Tampico and Vera Cruz, Mexico, in 1882; on the harbor of Galveston, Texas, in 1884; and had been personally consulted by the Emperor of Brazil concerning the harbors of his dominions. During his visits to Europe he inspected the mouths of nearly every river flowing into the Baltic Sea and the German Ocean, and also the river-courses of the Rhone, the Danube, including the works at their mouths, and the Theiss in Hungary, and likewise the Suez, Amsterdam, and Rhone ship canals. On the occasion of the Parliamentary inquiry into the merits of the Manchester Ship Canal, Mr. Eads was retained by the Mersey docks and harbor board of Liverpool, at a fee of £8,500, said to be the largest ever yet paid to an engineer. His evidence caused the rejection of the scheme as it then stood, and the modification by which the canal was laid out along the wide part of the Mersey. The last great enterprise to which Mr. Eads devoted his attention was the ship-railway across the isthmus of Tehuantepec. A valuable concession was obtained from the Mexican Government, and for several years Mr. Eads endeavored to persuade the United States Government to undertake the building of this railway, but he finally gave it up, and formed a private company for its construction. He was elected President of the St. Louis Academy of Sciences in 1872, and held that office for two terms. During the same year he was elected to the National Academy of Sciences. He

addressed the British Association for the Advancement of Sciences, of which he was a member, in 1881, on the improvement of the Mississippi, and also on the Tehuantepec Ship-Railway. In 1884 he received the Albert Medal from the British Society of Arts, which was then for the first time given to an American. He was a member of other scientific societies, and had held the office of Vice-President of the American Society of Civil Engineers in 1882-'83. The State University of Missouri, in 1877, conferred upon him the degree of LL. D. His writings and professional papers appeared variously, but the most important have been collected and published as the "Addresses and Papers of James B. Eads, together with a Biographical Sketch" (St. Louis, 1884).

ECUADOR, an independent republic in South America. (For details relating to area, population, and territorial divisions, see "Annual Cyclopædia" for 1885.)

Government.—The President is Don José María Plácido Canmáño, whose term of office will expire on June 30, 1886. The Vice-President is Don Pedro José Cevallos. The Cabinet was composed as follows: Interior, Foreign Affairs, Public Instruction, and Charity, Señor J. Modesto Espinosa; Finance and Public Works, Señor V. L. Salazar; War and Navy, Gen. J. M. Sarasti. The Minister of Ecuador at Washington is Dr. Don Antonio Flores. The Consul-General of Ecuador at New York is Don Domingo L. Ruiz. The American Consul-General at Guayaquil is Owen McGarr.

Finance.—The Government intends soon to pay a great portion of the so-called English debt, which in 1885 amounted to £1,824,000, on which the coupons have remained unpaid since 1867. The interest on this debt is 1 per cent. per annum as long as the duties collected at Guayaquil do not exceed \$400,000 per annum, and 25 per cent. of the excess of such revenue at Guayaquil till 6 per cent. per annum interest be reached. This foreign indebtedness arose from the conversion of Ecuador's share in the old Colombian debt. Furthermore, the Government will distribute the state lands that the holders of Ecuador land-warrants are entitled to. The budget for the fiscal year 1886 fixed the income at \$2,421,408, and the outlay at the same figure. The Guayaquil custom-house yielded in 1886 a revenue of \$1,940,536, being \$345,335 more than in 1885. The Banco del Ecuador of Quito declared a dividend of 20 per cent. for the year 1886. The Banco de Crédito Hipotecario has made a contract with the municipality of Guayaquil to advance a considerable sum for water-works.

Navy.—Early in 1887 they arrived at Guayaquil the "Cotopaxi," a new steel transport, which the Government has purchased. This vessel was originally built in 1884 for the Chilean navy. The armament consists of two Armstrong guns. The machinery is very

powerful, so that the trip from Valparaíso to Puna was made in less than eight days. Simultaneously a fast gunboat of light draught was bought in Europe, also to be furnished with the best guns. This vessel will be the third of its kind that the navy of Ecuador possesses.

State of the Country.—President Caamaño, in his message to Congress, expressed himself as follows with reference to the progress the republic is making: "Public instruction, considering the difficulties we have had to grapple with, is making most creditable headway; aid is being extended to charitable institutions in a most thorough and liberal manner by assisting with all our might hospitals and asylums; a large amount of money is being spent on the construction of a new lazaretto, and we are building a magnificent lunatic asylum, which will be among the best appointed in South America. Neither the scarcity of money, nor the crippled financial resources of the country, nor the disturbed political status it has suffered from, has prevented us from continuing without interruption the public works undertaken, and from entering upon new ones. Without going into full details I may say that work on the Southern Railroad is proceeding steadily; that the telegraph has been extended to the provinces of Imbabura, Carchi, Bolívar, and Los Ríos, and that the lines have begun to be laid in those of Loja, Manabí, and Oro; that the national wagon-road is being repaired in those of Pinchincha, Leon, Tungurahua, and Chimborazo; that an iron bridge is in course of construction over Lita river; that the bridges on the northern and southern wagon-roads are nearly finished; that we are laying out a botanical garden; that all public buildings are being kept in a good state of repair, and a Government edifice is being built at Ohntam; that we have furnished our coast with three additional lighthouses, so that this service of ours may be the best on the Pacific; that we concluded work on our handsome national theatre; that we are laying again the cable at the bottom of Guayaquil river, and that in this matter of telegraphic cables we are attending simultaneously to several enterprises."

Railroads.—In February M. J. Kelly, the contractor for the railway to the interior, had entered into a new contract for extending the line from Yaguachi, the present terminus, to Guayaquil, 22 kilometres. The new line was to be completed, if possible, in 1887, and the Government of Ecuador is to pay Mr. Kelly an interest of 6 per cent. on \$500,000 for twenty years. By this arrangement the Government pays interest only, and the contractor furnishes the capital. The new line is believed to be a profitable investment. Surveys were begun in September. The proposal to construct the Bahía de Caráquez and Quito Railroad, on which work was to begin in the autumn of 1887, met with much opposition in Quito, as some of the terms were considered too onerous;

but it met with equally warm support. This road will open up the tropical belt of the coast, and will also pierce the higher and cooler lands, where the products of the temperate zone are found in abundance. The contract made by the Government, and approved by Congress, with Don Ignacio Palan, stipulates that the coast terminus is to be at a point in the Bay of Caráquez where steamers are to connect with it to navigate the bay; that it is to be finished in ten years; and that the Government guarantees 6 per cent. interest on the capital invested in every kilometre from the moment it shall have been constructed. As security for the prompt payment of such interest, the revenue to be collected at the Manabí custom-houses is pledged, such revenue being estimated to produce \$100,000 per annum. Valuable land-grants are made on both sides of the line.

Telegraphs.—Early in 1887 the following capitals of provinces were connected by telegraph: Quito, Latacunga, Ambato, Riobamba, Cañar, Cuenca, Guayaquil, and Daule. There were in course of construction the following lines: Quito, Ibaña, Tulcan, Riobamba and Guaranda. The republic is in connection with the world's system by means of a land-line, which connects Guayaquil with Ballantrae, thence by cable with New York via the isthmus of Tehuantepec. The number of subscribers to the telephone at Guayaquil was 160 at the close of 1886.

Steam Navigation.—Merchants of Bahía have formed a steamship company for navigating the Chone and Capotillo rivers, and in the autumn the first steamer was being built at San Francisco, Cal., for the service between Motal, Segna, and Bahía, to be followed by another to ply between the two principal ports of Manabí, Manta, and Bahía, touching at Tabuco, Jama, and Pedomales.

Commerce.—The exports in 1885 amounted to \$6,680,815, including the precious metals, and 23,227,048 pounds of cocoa, worth \$5,080,918; specie and bullion, \$688,354; hides, \$269,405; coffee, 1,850,088 pounds, worth \$249,786; quinine-bark, 298,697 pounds, worth \$112,011; India-rubber, 427,254 pounds, worth \$102,541; the remainder being straw hats, vegetable ivory, tamarinds, and tobacco. The American trade for the year has been as follows:

Import into the United States from Ecuador	\$1,181,169
Export of domestic goods from the United States to Ecuador	1,049,392

The number of vessels that entered Ecuadorian ports in 1885 was 407, of which 185 entered at Guayaquil alone (117 thereof being steamers). The aggregate tonnage was 131,523.

Cocoa.—There arrived at Guayaquil from the interior for shipment abroad, in 1886, 384,752 quintals of cocoa, against 244,724 in 1885, and 176,955 in 1884. From Jan. 1 to Nov. 3, 1887, 813,000 quintals had been received at Guayaquil. The total consumption of cocoa is 80,000,000 pounds. France heads the list, taking 26,000,000 pounds; Spain comes next with

16,000,000 pounds; then England, 14,000,000 pounds, and the United States, 8,500,000 pounds.

Ivory-Nuts.—There had been shipped abroad from Guayaquil in 1886, 197,808 quintals of ivory-nuts, against 169,000 in 1885, and 107,759 in 1884. From Jan. 1 to Oct. 1, 1887, 237,157 quintals had been shipped.

Earthquake.—The most violent earthquake experienced at Guayaquil since 1868 occurred at twenty minutes past six o'clock A. M. on June 29, 1887. The shock lasted two minutes and twenty seconds, and the direction of the movement was from northeast to southwest. All the clocks in the city were stopped at the moment of the shock, and several buildings were demolished, but without injuring anybody. The great earthquake of Aug. 18, 1868, was most severe on the western flanks of the Peruvian Andes. The immense ocean-wave created by the upheaval of the Peruvian coast was propelled across the Pacific Ocean. On the adjacent South American coasts the sea-wave was very destructive, accomplishing in a few minutes greater havoc than the earthquake had made.

Boundary Dispute.—The Queen-Regent of Spain is to arbitrate in the matter of the limits between Ecuador and Peru.

The Death Penalty.—During the session of Congress that terminated on August 10, the following law was passed, in conformity with Article 136 of the Constitution: "The death penalty is not to be applied in punishment of purely political transgressions of the law, except in cases where a military, armed, and organized rising takes place with the intention of disturbing by force the constitutional order of things. The following are not considered political crimes, although they may have political ends for a pretext: Treason to the country, parricide, assassination, incendiarism, pillage, piracy, and the criminal deeds of military men in active service."

EDUCATION, INDUSTRIAL. The term "industrial education" has come into common use within the past few years, with two distinct meanings. In one sense it is applied to education intended to foster industrial skill and fit the pupil to enter some industrial pursuit on leaving school. But it is used by the most enlightened educators in a totally different sense, synonymous with the terms "new education," "creative method," and "manual training," and is regarded solely as a means of promoting the general education of the pupil by a new system of mental, moral, and physical development. The present article will treat the subject of industrial education in the United States in the latter more restricted meaning, viz., the development of the kindergarten principle into a system of general fundamental training, from the beginning to the end of the common-school age.

The Kindergarten was founded in this country by Miss Haines. Its first important branches were established, respectively, in

Boston by Miss Elizabeth P. Peabody and her sister, Mrs. Horace Mann; in New York by Mme. Kraus-Bölte; in St. Louis, by Miss Susan E. Blow. To them nearly all the present kindergarten in America can be traced, and the general acceptance of the theories that the development of the child should begin with a guidance of a spontaneous activity by games and recreations, in which practical knowledge for its own sake is ignored. There are about 500 kindergarten institutions, in at least twenty-eight States and Territories, with about 20,000 pupils and 1,000 teachers. The system has been introduced into the first six grades of the common schools in most of our large cities, and is an unquestionable success. The next step in progress, therefore, is the movement to introduce the manual-training school. The kindergarten regards the child as primarily a doer, so as to prepare him to become a knower; so-called industrial education takes him from his recreations to the workshop, and proceeds in the same line of development. The doing goes on, and the knowing begins, by means of a system that neglects none of the faculties that the kindergarten has begun to develop, as does the present common-school system, but proceeds logically to educate evenly the brain, the eye, and the hand.

This system has been advocated as a part of the common-school curriculum for about ten years. Among its first and leading advocates have been Felix Adler and G. von Taube, of New York, Francis A. Walker and John Clark, of Boston, O. M. Woodward, of St. Louis, and James McAlister, of Philadelphia. Since attention has been called to it, the leading educators of the country have begun to study its merits and the practical tests to which it has been put in the industrial training-schools of Europe. By the majority of these men it is warmly approved, as being superior to the old system in its effect on the health, the mind, and the morals, and practically in making the hand a useful instrument. The chief arguments in its favor are: that it is based on a scientific understanding of the physiological development of the child's mental capacity; that in beginning at an early age to give children a knowledge of shape, form, and color, of common materials, their beauty and their usefulness, of tools and how to use them, and to teach them the application of abstract mathematical studies, not only gives them a broader understanding and appreciation of art and mechanics, but also cultivates habits of industry and practical views, accustoms them to exact measurements, to close observation and accuracy in thought as well as work, and at the same time supplies them with some fundamental training for the practical demands of life, while employing the best possible means of developing the reasoning powers, quickening the constructive and inventive faculties, overcoming a growing distaste in the race for purely intellectual work, and raising the grade

of general intelligence in the nation. The tendency of this method is to stimulate a desire for excellence for its own sake, to supplant the present want of respect for manual labor, to foster thoroughness, to stimulate Americans to attain a skill in handicraft that shall be equal to that of the Europeans who now almost monopolize the best paying departments of our industrial pursuits, and to turn the attention of the rising generation toward the callings in which there is or will be the greatest demand for workers. From the first the opposition to industrial education has been comparatively small. It is generally approved for special schools, and almost all the opposition to incorporating it into the common-school system arises from a mistaken belief that it is intended to sacrifice some of the present intellectual studies to fit the pupils for immediate practice in certain trades and professions, whereas the soundest advocates of this industrial education are strenuously opposed to any sort or branch of trade-teaching as such, and only accept certain rudiments of certain trades combined with the abstract studies on which they are based, because they provide a better means than any now in use to develop the mental powers and at the same time develop and train manual facility, the latter of which they regard as an essential part of fundamental training.

Cooking has received much attention of late as a branch of industrial education, and in Boston has been made one of the common-school studies. This, also, is practically teaching a trade. Through the liberality of Mrs. Augustus Hemenway, of Boston, a cooking-school, known as the Boston School Kitchen No. 1, was opened in the Tennyson Street Primary-School building, North End, in November, 1885. It was admirably fitted up and placed in charge of a skilled cooking-teacher, who gives instruction in the keeping of the kitchen and care of cooking-utensils, as well as in the making of dishes and the most important facts in the chemistry of foods and their adaptation to the wants of the human body. These pupils, like those in the carpentry classes, are selected by the masters of the schools in the vicinity of the Tennyson Street building. In 1886-'87, there were ten classes of fifteen girls each, each class receiving two hours a week, the sessions of the cooking-school being held the same as in the regular schools. The total cost of such a school is about \$900 a year. The Boston School Kitchen No. 2 maintained by the city, under the direction of the Manual-Training Committee, is in the Drake Primary building, South Boston. It was opened in the autumn of 1886. It is modeled after No. 1. Being somewhat larger, it accommodates twenty girls. Much private solicitation has been made for similar schools in various parts of the city, and in the present year the Board of Education has opened one more school in Roxbury, and has arranged for oth-

ers in Charlestown and the South End. One hundred and thirty-four girls attend the private School of Cookery on North Bennett Street, so that all the girls in the schools of the city proper and South Boston have the opportunity to receive a course of twenty lessons in cookery as a part of their common-school education.

Boston.—The first general interest in this subject among Americans was roused by the exhibit at the Centennial Exhibition, in 1876, of the work done at the Imperial Technical School of Moscow, Russia. The School of Mechanic Arts in Boston, established in the same year as a department of the Massachusetts Institute of Technology, was the first direct result of this influence, and was the first attempt in this country to provide for boys a course of study simply preparatory to trade-teaching. It was arranged on a plan similar to those of the Imperial Technical School of Moscow, the Royal Mechanic Art School of Komotau in Bohemia, L'École Municipale d'Apprentis of Paris, and the Ambachtschoolen of the principal cities of Holland, with certain differences adapted to the American student. It has been the pioneer, and, with modifications, the model for nearly all the manual-training schools that have since been established in this country. The hand-work is done without regard to any pecuniary value, but is designed to train and develop the judgment, self-reliance, and executive power of the student. Pieces practically useful are only introduced when this can be done without detriment to the real purposes of the courses. Boys under fifteen years of age are not received for the regular course, and an examination equivalent to that for the ordinary Boston grammar-school graduation is required for admission. The course includes two years of mechanical training and intellectual study, arranged as follows:

FIRST YEAR.—1st term: Shop-work—carpentry; algebra, geometry, English composition, mechanical and free-hand drawing. 2d term: Shop-work—wood-turning, pattern-making, foundry-work; algebra, geometry, metric system, English composition, mechanical and free-hand drawing.

SECOND YEAR.—1st term: Shop-work—forging; algebra, elementary physics, English composition, mechanical and free-hand drawing, French. 2d term: Shop-work—visc-work, machine-tool work; geometry, physics, English composition, French, mechanical and free-hand drawing.

The first attempt to add a manual-training department to any public school was made in Gloucester, Mass., in 1878, with money placed at the disposal of the school trustees for this purpose by the executors of the estate of George O. Hovey. A room was fitted up with twelve benches and all equipments necessary to teach the use of some of the principal tools used in carpentry. With a practical carpenter as teacher, the experiment was begun with four Saturday classes of twelve members each. The pupils were from the two upper grades of the grammar-schools. The course

was of forty lessons, each of which was equivalent to half of a half-day session. In 1880 a change was made by which pupils did not have to sacrifice part of their holiday for this instruction, and with it the attendance increased from thirty to ninety-six. Lessons in carpentry were given during school-hours four afternoons in the week, two classes being taught each afternoon. Eight classes then received instruction for one hour each during half the afternoon session. Two classes and a part of a third were made up of girls, whose work was pronounced by the superintendent as equal to that of the boys, and who seemed to enjoy it heartily. The superintendent says: "A room similar to the one we had can be fitted up for a carpentry class for not more than \$500. In such a shop, thoroughly equipped, one teacher can efficiently instruct four classes each day—twenty classes each school-week. Sixteen members may be permitted to attend each class, without detriment to the progress of each. Allowing forty weeks for the academic year, and making the salary of the teacher \$20 a week, the annual cost of instruction would be \$800. The cost of stock would not exceed 50 cents per annum for each pupil. Upon this basis the *per capita* cost of instructing 320 pupils would be about \$3 a year." The cost of this experiment during its continuance of about eighteen months was \$742.50. It was discontinued with the close of the spring term in 1880, because the city government refused to make an appropriation for it, and the Hovey executors were not willing to maintain it any longer. It proved, however, some of the theories on the effect of such training, and the example was soon followed in other places.

Upon the offer of the Boston Industrial School Association, a similar experiment was tried in the Boston public schools from January to May, 1882. A room in the Dwight Grammar-School for boys was fitted up as a carpenter-shop, a practical carpenter was employed as instructor, and two classes of eighteen members each were selected, one being from the upper or graduating class, the other from the 2d, 8d, and 4th grades. The boys selected were of both American and foreign parentage, and represented the oldest and largest as well as the youngest and smallest of their respective classes. The course of instruction was arranged in eighteen progressive lessons, each class receiving practically one two-hour lesson a week. No pupil could keep on in this course who did not maintain his rank in his regular studies. Without any expense for room-rent and heating, the total cost of these lessons was \$711.95, making the cost per pupil about \$6. The experiment was regarded as a positive benefit to the students in its influence on their other school-work.

The second experiment in Boston was the establishment, in 1884, of another carpentry class. This was opened in the basement of the Boston Latin School, and still exists. The

course is similar to that taught in the Dwight School. The classes come from the different schools. Each is made up of about twenty boys, who must be over fourteen years of age, and who receive one two-hour lesson a week, for which they are excused from attendance at their grammar-schools.

Sewing, which is more a branch of trade-teaching than an element of industrial education, according to the restricted use of that term, has for many years been a part of the regular course of instruction for girls from eight to eleven years of age in the Boston grammar-schools. The cost of materials amounts to not more than \$200 a year for the whole city; for, as the children become proficient, parents are glad to have them make and mend for the family in their school classes. The total number of articles made in all the Boston schools in 1887 was 72,721, and, by the skill there attained, young girls fresh from school every year find steady, remunerative employment as sewing-women.

New York.—The Free Kindergarten and Workingman's School of New York city was the first institution in this country organized for the purpose of teaching children of all grades of the school-age according to the principles of the creative method quoted at the beginning of this article. It was established in 1879 by Felix Adler, President of the Society for Ethical Culture, under whose auspices the schools are maintained as a part of their United Relief Works. In June, 1887, a class of eight pupils was graduated, the first that had completed the full course above the kindergarten. During the past four years the schools have occupied their present quarters in the large four-story school-building erected for them at 109 West Fifty-fourth Street. They are unsectarian, and receive pupils of both sexes and all nationalities between the ages of three and fourteen years, charging no tuition-fees. At present the pupils are only those from the poorest classes, since they have the greatest need of the best education. The course of study covers six years in the kindergarten and eight years in the Workingman's School. There are now about 850 children in both departments. The annual expenses are about \$20,000, and are defrayed by private contribution. The school receives no aid from the State. It has been found necessary to alter the details of the original system many times, and this year, under the new superintendent of the school and kindergarten, Andrew J. Rickoff, the entire curriculum is to be thoroughly revised and be made to carry out more fully and precisely the educational and humanitarian principles for which the institution was founded. The general plan will still be the same—parallel work in the shop for manual training; in the *atelier*, for the development of the artistic and imaginative faculties; and in the recitation-rooms, for the more intellectual or literary studies. In connection

with the schools there is much home-work in the families of the pupils. Parents' meetings are held regularly, and in summer the superintendent takes his colony of pupils to Sherman, Pa., to give those whose lives are passed in the city certain elementary impressions of nature, without which, as a foundation, the important study of natural history can not be built up.

The College of the City of New York was the second institution in New York to introduce manual training into its curriculum. In 1888 a workshop was opened, in which the students might spend certain hours, and since 1885 there has been a regular mechanical course, including manual training, which extends over the entire three years, and may be taken by any student. For those who are unable to take the full college course of five years, there is a shorter course of three years, called the mechanical course, in which the time is about equally divided between academic studies and drawing and workshop practice. The student, in the five-years' course, can take extra shop-work instruction four and a half hours a week, after the regular exercises of the day. Experience has proved that the additional hours in the shop do not overtax or in any way hamper the student's regular work. It has generally proved beneficial as exercise and recreation. In 1886 there were 185 students in the workshops, their ages ranging from fourteen to twenty-one years. The annual cost of this instruction is about \$8,600, about \$100 of which is spent for materials. The cost of the plant has been about \$8,450, including a steam-engine and boiler, which are used for ventilating and warming the college buildings.

With the exception of the many free, charitable schools that give special training in certain industries, and are in receipt of money from the public-school fund, the college had up to about Jan. 1, 1888, the only manual training-classes under the control of the New York Board of Education. But the kindergarten is established in the first six grades of the primary schools, industrial drawing is taught in the evening schools and in the schools where children of foreign parentage are instructed in the English language; and in October, 1887, the board decided to try experimentally in all the grades above the kindergarten of a few schools the introduction of a new system, combining manual training with the more purely intellectual studies, which, if successful, will be adopted for all the common schools of the city.

Although, with the exception of Prof. Adler's school, New York has been in point of time behind many cities in providing for industrial education, it has now, even before the experiment has yet been put into operation in the public schools, more institutions of this kind than any other place in the country. Besides those already mentioned, it has three corporate schools devoted to this work, viz., the Industrial Education Association, the He-

brew Technical Institute, and the Gramercy Park School and Tool-House. The Industrial Education Association, No. 9 University Place, was organized with its present name and object in 1884. Its devotion to industrial education as defined at the beginning of this article is wholly educational, and not charitable, and is on a broader basis than any other institution in the country. As yet it is no more than started in its actual working, but its purposes are to unite all the work in this direction in the various parts of the city, to influence and educate public opinion in favor of it, to give instruction in the kindergarten and all branches of industrial education, to maintain free courses of lectures on this and other educational topics, and to provide a complete free educational library and reading-room and issue circulars of information on educational topics of the day. In 1886 the association moved into its present quarters, and, with ample room and excellent equipment, entered on its enlarged scale of work, in all branches of which it has, within two years, made a successful beginning. Through its instrumentality industrial drawing, clay-modeling, wood-carving, carpentry, and sewing have been introduced into the public schools of Hoboken and Staten Island, with a fair degree of success. During the summer of 1887 a large part of the work in the association's building was suspended, on account of alterations to provide for more extensive work in the autumn. With the beginning of the second year, a normal college in kindergarten and industrial education was opened, and in connection with it a model school for boys and girls between the ages of three and fifteen years. The schools have begun with 38 normal students, 16 of whom are taking the full course, 35 children in the regular model courses, and 55 others in special instruction.

The Hebrew Technical Institute, at 84 and 86 Stuyvesant Street, is a manual training-school for Jewish boys. It was established in 1884 by the present director, Henry M. Leipziger, for the purpose of turning the attention of the Hebrew youth toward industrial pursuits and giving them a general preparatory education for entering the trades. Instruction, tools, and materials are free. There is an enrollment of about 100 pupils in five classes, averaging 20 pupils each. Pupils are admitted at twelve years of age, and are expected to have reached the fourth grade in the city public schools. The hours are from 9 till 4 o'clock daily, and special instruction in wood-carving is given from 4 to 6 o'clock on Mondays and Thursdays. The course of instruction is made up of common-school studies, drawing and mechanical work. The full course covers three years, during the first two of which the principles of many trades are taught, with a knowledge of materials, use of tools, etc. In the third year, first work in special trades, selected with reference to the aptitudes and preferences of the pupils, is taught.

The Gramercy Park School and Tool-House is a pay-school, in which the theoretical and practical are harmoniously combined in a course of study that is extended over twelve years, and is based on the three essential divisions of culture or education, physical, intellectual, and moral. The course of study, which was originated and developed by Prof. G. von Taube, is adapted to the characteristics shown respectively in the four natural stages of brain development. For the first two of these periods, which comprise six years and take the child up to about thirteen years of age, the course is designated as objective. In the first three years, or junior objective grade, no books are used. Very few are used in the next three years, or senior objective grade, most of the lessons being worked out with the teacher. The course covering the third and fourth stages is more purely intellectual, and is divided into the junior subjective, for the ages of about fourteen to eighteen, and the senior subjective, for the student of the highest grade, whose graduates may be about twenty-one years of age. A course of objective and subjective studies, elaborated on this basis, is held by Mr. von Taube as the true system of education, and aims to provide a complete business and social training, or a thorough preparation for the scientific course in the American colleges or foreign polytechnia. One general course is followed for all in the lower or objective classes, but separate courses for each of the higher or subjective classes. As the school was founded in 1884, there has not been time for a student to complete the full course; but, so far as it has been tested, the system is regarded as eminently successful.

St. Louis.—The Manual Training School of the Washington University at St. Louis, Mo., was the first school established in this country for the sole purpose of providing a graded course of non-technical study for boys of the high-school age, adapted as equally as possible to intellectual and manual training. The plan was in a sense original, and from the first its success has been so great that it has served as a model for many similar schools in various States. It is a non-classical high-school, where, in a three years' course, the essential mechanical principles of all trades are taught, without going into the details of any trade, where articles are not made for sale, and where all shop-work is disciplinary. The school exacts close and thoughtful study with tools as well as with books. By lengthening the usual school-day a full hour, and by abridging somewhat the number of daily recitations, time is found for drawing and tool-work, and a more liberal, intellectual, and physical development. In short, a more symmetrical education is given than can be afforded in the usual high-school. This school was established as an experiment by the Board of Directors of the University, to meet the manifest need of some such education among the

growing boys of St. Louis. Under the charge of its present director, Prof. C. M. Woodward, it was opened with about fifty pupils in September, 1880. Sixty-seven pupils were enrolled during the first year, 107 during the second, 176 during the third, at the close of which there were 29 graduates. In the fourth year 201 were enrolled, 29 being graduated in 1884; in the fifth, 218 were enrolled, 39 being graduated in 1885; the sixth year's enrollment was 233, with 45 graduates in 1886; the seventh year's enrollment, 225, with 52 graduates in 1887. The course of instruction covers three years and embraces five parallel lines, three purely intellectual and two both intellectual and manual, and including literary studies, free-hand and mechanical drawing, and mechanical exercises in the shop, together with instruction about tools and their use. Each wood-working shop has uniform accommodations for a class of 24 pupils, and the entire building is admirably equipped with apparatus for the most practical instruction, which is given similarly to laboratory lectures. The school is supported by endowments and by fees paid by its pupils.

Chicago.—The Chicago Manual Training School, which is similar to that of St. Louis, was the second institution of its kind in this country. It was founded as the private enterprise of the Commercial Club of Chicago, which in 1882 subscribed \$100,000 "to inaugurate a school for instruction and practice in the use of tools, with such instruction as may be deemed necessary in mathematics, drawing, and the English branches of a high-school course." It is substantially a duplicate of the St. Louis school, but, unlike that, is independent of all other institutions. It was opened in February, 1884, under the charge of its present director, Henry H. Belfeld, when 72 pupils, all that could be accommodated, were admitted. In September, 1886, its capacity was increased, and a junior, or first year's class of 96 was admitted. It is supported by the endowment of the Commercial Club and by its tuition fees.

The Chicago Public Training School offering manual training as a part of public-school instruction, was opened in October, 1886. For the first year it was only a school of carpentry. Its plans for the future are not yet definitely arranged, but its work will be upon a broad basis and probably provide a four years' course in combined intellectual and manual training. During the first year the attendance was 72 pupils, whose ages ranged from twelve to sixteen years. It is open to pupils of the first year in the three city high-schools, and the sessions are five afternoons in the week. Attendance is optional, and, by arrangement of the study-hour in the high schools, the pupil loses nothing from his regular studies by taking this additional course.

Toledo.—The Manual Training School of the Toledo University, Toledo, Ohio, also a

school of the St. Louis type, was established in February, 1885, as the first department of the Toledo University. It was founded by Mr. and Mrs. Jesup W. Scott and others as the Toledo University of Arts and Trades, but was subsequently deeded to the city, which, in accepting it, passed an ordinance establishing a "university for the promotion of free education of the youth of both sexes within the city," of which this school should be the beginning. The director, Prof. R. H. Smith, is a graduate of the St. Louis school, after which this has been modeled in many respects, but with certain changes. The course is more elaborate than in any of the previously named schools of the West. It covers four years, and includes domestic economy for girls. The lowest age of admission is thirteen years, and no pupil is received who has not reached the senior grade of the grammar-school. Tuition is free to residents of Toledo. During 1886-'87 the attendance was 270, boys and girls. In drawing, girls take much the same course as the boys, modified by a little more of the design and art element. In the first year, girls take simple wood-carving, and enough of carpentry to teach them the manipulation and sharpening of tools. Their work in this department compares favorably with that of the boys. In the second year the girls take cookery. It is proposed hereafter to teach sewing in the second year, and cooking in the third. It is also proposed to add this year a number of senior grammar pupils of the highest grade. The students who enter this school have no election as to particular studies. Each must conform to the course as laid down, and take every branch in its order. But in the evening high-school, opened soon after the day-school, the students can elect such branches as meet their tastes or have direct bearing upon their occupations, although a full course is provided, which is much the same as that of the day-school.

Baltimore.—The Baltimore Manual Training School was the first established by any municipality of the United States as an integral part of its public-school system. The accommodations, fittings, and course of study in this school, as well as its aims and purposes, are similar to those of the St. Louis and Chicago schools. Intellectually, the school is on a level with the city college, from which it differs in affording scientific instruction and actual practice in the care and use of tools, in giving prominence to mechanical drawing, in having more practical methods of teaching book-keeping, physics, and chemistry, and in omitting from its required studies foreign and ancient languages. It was opened in March, 1884, with sixty students, and under the general direction of the present principal, John D. Ford, P. A. E., U. S. N. The enrollment increased to 100 before the close of the year, and to 150 in the following September. In 1886-'87 there were 281 students, of whom 25

were graduated in June after the full three-years' course, while 100 had left before graduation, to take employment as wage-workers. The year 1887-'88 opened with 268 students. A preparatory class has been established since the school was opened, and in Nov., 1887, an unclassified night-school was opened for the winter months, to give as much of the work laid down in the catalogue as possible to those who wish to take these studies but are engaged during the day. In establishing this training-school, the city council provided that admission to it should be regulated by the law governing the ordinary public schools, excepting that the Board of Education should regulate the age of admission and have power to set terms of tuition for pupils outside of the city, and that the use of tools and materials for the city pupils should not exceed \$1 for the scholastic quarter.

Philadelphia.—The Manual Training School of Philadelphia provided for boys is one department of an extensive system of industrial education now being developed in the public schools of that city. It was opened in September, 1885, in one of the school-buildings, which was fitted up for the purpose, and is filled to its utmost capacity. Pupils who have finished the grammar-school course are admitted by examination once a year. The course of three years includes systematic manual training similar to that in the Western schools, and in addition a course of instruction in the English language, mathematics, mechanics, elementary science, history, and social science, and free-hand and mechanical drawing. Three hours a day are given to school-work, one hour to drawing, and two hours to manual training in the workshops. The Industrial Art School, which was originally in the hands of a private association, was adopted by the Philadelphia Board of Education in 1882, when, with some important changes in its course of instruction and terms of admission, it was made a free school for boys and girls. Pupils from all grades of the regular grammar-schools and some classes of the secondary schools, have the opportunity, if they wish, to receive class instruction there in free-hand designing, modeling in clay, wood-carving, and metal-work, including hammering, embossing, and chasing. The total attendance is about 600, about 160 pupils being received at once, and each having two hours' instruction a week. Other branches of industrial education in the Philadelphia public-school system consist of the kindergarten, which were adopted Jan. 1, 1887, and of which 80 are in operation this year; of instruction in sewing, which has been in the schools since about 1882, and, thoroughly systematized, now forms a part of the regular school-work of all the grades of the girls' schools, beginning with the third grade, so that 25,000 girls received the instruction in 1887; and the cooking-classes. These were begun as an experiment in the autumn of

1887 in the girls' normal or high school, from which, if successful, it will be extended into the girls' grammar-schools.

The mechanical training department of Girard College, in Philadelphia, is one of the best planned and conducted manual-training schools in this country. The present course of study was adopted in 1886, and has thus far resulted so well that the trustees feel every encouragement to continue and improve it. "Every branch indicated by Mr. Girard is taught, and, although six hours of the week of the thirty-two heretofore devoted to study are now spent in the mechanical shops, we find that, owing to the change of pursuit, the boys get through as much work and as well in the twenty-six hours as they did formerly in thirty-two." The course embraces the whole range of mechanical drawing, carpentry and wood-turning, foundry, forge, and iron-work; but it differs from nearly all other schools of this kind in the arrangement of the plan of instruction. The pupil first makes his drawing from the object—some simple article or piece of machinery. This drawing he takes to the wood-working and turning department and works out a model to scale as a pattern. This, after it is approved, he takes to the molding-room and makes ready for casting, which is done in lead or iron. Then he carries his metal casting to the metal bench, where, with chisel and file, and at an advanced stage with the lathe, he completes his article. He then begins again in the draughting-room with something a little more complicated, and follows the same course as before. The method has proved eminently successful.

Montclair, N. J.—This was one of the first places in the country to introduce manual training into the various grades of the public schools. The experiment of a carpentry-class was first tried, with a plant costing \$850, in 1882. Since then it has steadily grown and improved. The teacher is a carpenter and skilled mechanic. The instruction is given to all the grammar-school boys of the fourth, third, and second grades, whose ages are from ten and one half to fourteen years. Girls are instructed in sewing in their class-rooms by their regular class-teachers while the boys of their classes are in the shop. Pupils of the high-school, the highest grade of the grammar-school, and the primary departments do not receive this training.

Cleveland, Ohio.—Here a simple start has been made in a private enterprise which, in view of its almost certain adoption or absorption into the public-school system, is about to be enlarged, and in its control, general course of instruction, etc., will resemble the institution at Toledo. Even in 1887 no pupils were admitted who could not pass an examination equivalent to that required for admission to the local high-school.

Industrial education is also in some way provided for or encouraged in some of the schools

of New Haven, Conn.; Moline and Peru, and Cook County Normal School, Normal Park, Ill.; in Milford and Springfield, Mass.; in the State Normal School at New Britain, Conn.; in Omaha, Neb., Eau Claire, Wis., Barnesville, O., and in San Francisco, Cal.

EGYPT, a principality in northern Africa, tributary to Turkey. The reigning sovereign, called the Khedive, is Mohammed Tewfik, born in 1852, who succeeded to the throne Aug. 8, 1879, on the abdication of his father, the Khedive Ismail. The President of the Council of Ministers and Minister for Foreign Affairs is Nubar Pasha, who is also Minister of Justice. The Minister of the Interior is Mustapha Fehmi Pasha, who is at the same time Minister of War and of the Marine. The Minister of Public Works and Minister of Public Instruction *ad interim* is Abderrahman Rushdi Pasha. The Minister of Finance is Mohammed Zeki Pasha. Mustapha Fehmi Pasha was formerly Minister of Finance, but exchanged that department for the Ministry of the Interior and of War on the retirement of Abd-el-Kader Pasha in March, 1887, being succeeded by Zeki Pasha, previously Minister of the *Wakfs*, or religious estates.

Area and Population.—Egypt proper extends as far south as Wady Halfa, at the second cataract of the Nile. This place has been provisionally agreed upon as the southern boundary of the Egyptian dominions, which formerly extended nearly to the equator.

The total area of Egypt, not including the still occupied territories of the Soudan, is computed by the general staff to be 1,021,354 square

kilometres. Outside of the valley and delta of the Nile, it comprises the Governments of Koesseir, on the Red Sea, El Arish, in Syria, and the isthmus of Suez on the east, and on the west the oases of the Libyan Desert. A great part of the surface is uninhabited, except by nomads. The population of the administrative divisions, with their area in square kilometres, according to the census taken on May 8, 1882, is as shown in the table on the preceding page.

The areas given include only the lands that are surveyed and taxed. The population is divided into 8,401,498 males and 3,415,767 females. There are 246 inhabitants per square kilometre. The sedentary population in 1882 was 6,479,850; the nomadic and semi-nomadic Bedouins, 246,529; foreigners, 90,886. The alien population included 37,301 Greeks, 18,665 Italians, 15,716 French, 8,032 Austrians, 6,118 British subjects, 948 Germans, 687 Belgians, 589 Spaniards, 583 Russians, 412 Swiss, 323 Servians, Roumanians, and Montenegrins, 221 Dutch, 65 other Europeans, 188 Americans, and 1,153 Persians and other Asiatics.

The population of the chief cities in 1882 was as follows: Cairo, 374,838, including 21,650 foreigners; Alexandria, 227,064, including 48,672 foreigners; Damietta, 84,044; Tanta, 33,750; Assiout, 31,575; Mehalla-el-Kobra, 27,828; Mansourah, 26,942; Fayoum, 25,799; Damanhour, 23,358; Zagazig, 19,815; Rosetta, 16,666; Port Said, 16,560; Menouf, 16,293; Chibrin-el-Kom, 16,250.

Commerce.—The average annual value of the merchandise imports between 1879 and 1883 was 7,127,152 Egyptian pounds, and the average value of exports 12,488,792 Egyptian pounds (£E1=£5). During that period there was an annual net importation of specie averaging 2,381,596 Egyptian pounds. The commercial movement for the three years following 1883 has been as follows, the values being given in Egyptian pounds:

YEARS.	MERCHANDISE.		SPECIE.	
	Imports.	Exports.	Imports.	Exports.
1884	8,182,702	12,549,080	2,172,596	889,763
1885	8,989,042	11,424,970	3,914,787	1,298,660
1886	7,946,281	10,129,622	1,883,797	2,972,590

Of the total value of the imports in 1886 £E3,552,000 came from Great Britain and her colonies, £E883,000 from France, £E1,328,000 from Turkey, £E445,000 from Russia, £E910,000 from Austria-Hungary, £E270,000 from Italy, and £E460,000 from other countries, including £E83,000 from America. Of the exports £E6,422,000 went to Great Britain, £E907,000 to France, £E378,000 to Turkey, £E1,046,000 to Russia, £E598,000 to Austria-Hungary, £E592,000 to Italy, £E187,000 to other countries, including £E21,000 to America. Of the imports £E6,781,749 and of the exports £E9,866,022 passed through the port of Alexandria. Of the total tonnage entered and cleared there in 1885, which was 1,584,407,

758,324 tons was British, 216,105 Turkish, 186,818 Austrian, 118,800 French, 112,907 Russian, 63,422 Italian, and 48,444 Greek. The English and French, nearly all the Austrian and Russian, the greater part of the Italian, and a large portion of the Turkish, vessels were steamers.

The values imported and exported of the various classes of commodities in 1886 were, in Egyptian pounds, as follow:

MERCHANDISE.	Imports.	Exports.
Cereals	650,000	716,000
Fruits, seeds, etc.	316,000	1,225,000
Colonial products	267,000	490,000
Tobacco	268,000
Fermented beverages	374,000	2,000
Animals, etc.	382,000	82,000
Total alimentary articles	2,294,000	2,508,000
Fuel	457,000
Minerals	59,000	2,000
Metals	280,000	42,000
Hides and skins	48,000	145,000
Textile materials	79,000	7,157,000
Timber, etc.	827,000
Total raw materials	1,960,000	7,876,000
Glass and pottery	96,000
Metal manufactures and machinery ..	320,000	41,000
Textile yarns	155,000	12,000
Textile fabrics	2,323,000	38,000
Leather goods	184,000	1,080
Wood manufactures	92,000	16,000
Paper and books	107,000	7,000
Total manufactured articles	3,199,000	110,000
Drugs and chemicals	802,000	88,000
Gums, oils, etc.	581,000	15,000
Various articles	802,000	28,000
Total miscellaneous articles	1,185,000	76,000
Total merchandise	7,648,000	10,180,000

FINANCES.—The normal budget of receipts fixed upon by the international financial convention of March 17, 1885, was as follows:

RECEIPTS.	Egyptian pounds.
Direct contributions	5,116,000
Indirect contributions	1,680,000
Revenues of receipts' administrations ..	1,680,000
Receipts of administrative services	354,000
Rent of Government property	78,000
Contributions to pension fund	60,000

Total 8,910,000

The expenditure of the Government was limited as follows:

EXPENDITURES.	Egyptian pounds.
Civil list, etc.	258,000
Administration and collection of taxes ..	1,794,000
Cost of receipts' administration	572,000
Public security	597,000
Eastern Sudan	120,000
Pensions	457,000
Tribute and debt	1,087,000
Extraordinary expenditure

Total 5,287,000

The receipts of the treasury in 1885 amounted to £E9,687,173, and the expenditures to £E9,184,746, including £E417,761 of extraordinary expenditures that were defrayed from the proceeds of the new loan of 1885. In 1886 the receipts amounted to £E9,574,893, and the expenditures to £E9,402,529. The

loan of 1885 was drawn on to meet ££616,797 of extraordinary expenditure, and a budget surplus of ££85,012 was applied to the reduction of the debt. The budget estimates for 1887, as sanctioned by the council of ministers on Dec. 1, 1886, make the total revenue ££9,675,247 after deducting ££240,000 for unforeseen deficiencies. The receipts under the various heads were estimated as follows: Direct contributions, ££5,665,883; indirect contributions, ££1,748,069; revenues of the receipts' administration, ££1,864,408; receipts of the administrative services, ££498,940; product of Government property, ££84,152; receipts of the Government of Suakin, ££13,800; retentions of salaries, ££40,000. The expenditures under the various heads were estimated at the following amounts: Civil list, etc., ££358,100; cost of administration and tax-collection, ££1,845,716; expenses of the administration of receipts, ££941,452; public security, ££589,517; the Soudan, ££35,200; pensions, ££500,000; tribute and public debt, ££5,043,976; partial suppression of the *corvée*, ££250,000; various expenses, ££65,000. The total expenditure amounts to ££9,628,961, leaving an excess of receipts of the amount of ££46,286. The final accounts for 1886-'87 showed a surplus of £177,000, which, added to that of the preceding year, made £578,000, out of which the Government ordered the deduction of 5 per cent. from the coupon, amounting to £437,000, to be refunded. The occurrence of a deficit, which would have entailed an international commission in accordance with the financial convention of 1885, was only avoided by a contribution of £200,000 from the British exchequer. This subsidy was given under pretense of satisfying claims of the Egyptian Government for the transportation of British troops and for the expenses of the Nile expedition and of the defense of the frontier, although previously the British Government had declined to assume these burdens.

The budget for 1887-'88, as finally approved, places the revenue at £9,600,000, and the expenditure at £9,576,000. For the next year the Government will have to meet the expense of defending the Soudan frontier out of the ordinary revenue, as the guaranteed loan has been exhausted. It has therefore determined on increasing the duty on domestic tobacco.

The various classes of the public debt stood on Jan. 1, 1887, at the following amounts in pounds sterling:

Unified debt (4 per cent.)	£55,990,440
Privileged debt (5 per cent.)	22,296,800
Guaranteed loan of 1885 (8 per cent.)	9,801,700
Total consolidated debt	£87,588,940
Domains loan	£7,854,240
Daira-Sanah and Daira-Khassa loans	8,659,500
Total guaranteed loans	£16,013,740
Total public debt	£103,602,680

The Egyptian people have yet to pay for nine years to come the interest on the Khe-

dive's shares of the Suez Canal that were purchased by the British Government, the Khedive Ismail having for that period mortgaged the dividends to his creditors. The Moukabala debt, an internal forced loan, is not included in the above statement. The original Moukabala arrangement was that, if the Egyptians paid for twelve years about 45 per cent. more than the regular land-tax, they would after that period have to pay only one half the former tax. This agreement was abrogated in 1876 by the Khedive, who promised to return the sums paid in excess of the regular tax. This the foreign creditors would not allow, and, in the final settlement made by the international commission of liquidation, the bulk of the debt, which amounted to £17,000,000, was repudiated, the only return that was promised to the holders of Moukabala certificates being an annuity of ££150,000, to be paid for fifty years, or until 1930.

By the financial convention of 1885 the great powers agreed to guarantee a new loan of £9,000,000, bearing interest at 8 per cent., which was to be applied to the settlement of the Alexandria indemnities and the floating debt, each amounting to about £4,000,000, and to the construction of irrigation works. The sum of £1,000,000 was destined to meet the expense of evacuating the Soudan and defending the frontier, and this appropriation was exhausted by the end of the financial year 1886-'87. The powers at that time sanctioned the suspension of the sinking fund of the other loans and the levying of a tax of 5 per cent. on their coupons, to be repaid if the finances of Egypt permit at any future time, but only for the years 1885 and 1886, unless an international commission shall sanction the continuance of the tax.

The Army.—The Egyptian army has recently been reduced from 17,000 to 11,200 men. It is under the command of an English major-general, Sir Evelyn Wood, and officered partly by Englishmen and partly by Egyptians. It consists of 15 battalions of infantry of about 600 men each, 2 squadrons of cavalry of 180 men each, 1 battery of field-artillery, 2 camel batteries, and 1 battery of heavy artillery.

The gendarmerie and police as organized by Baker Pasha consists of 2 infantry battalions, of which one of 400 men is mounted, and 4 divisions of police troops. The entire force numbers 5,936 men. One of the police divisions, 1,180 strong, is destined for the police service of Cairo.

The British Government in the beginning of 1887 announced the intention of reducing the army of occupation from 11,000 to 5,000. The reduction was begun in January, but was not carried out. In May the force remaining in Egypt was 9,800.

The Suez Canal.—The cost of the original construction of the Suez Canal, and of its subsequent enlargement and other improvements, amounted in the beginning of 1884 to 488,055,019 francs. The receipts during 1886

amounted to 57,730,449 francs. The number of ships that passed through in 1886 was 3,100; the aggregate tonnage was 3,188,813. The English vessels numbered 2,381, of 6,254,418 tons; the French 227, of 699,194 tons; the German 161, of 314,716 tons; the Dutch 127, of 312,965 tons; the Austrian 77, of 191,333 tons; the Italian 69, of 184,960 tons; the Spanish 26, of 88,077 tons; the Russian 24, of 53,289 tons; the Swedish and Norwegian 28, of 47,991 tons; the American, 7 of 9,767 tons; the Japanese 4, of 9,355 tons; the Turkish 10, of 6,419 tons; Portuguese, Belgian, and others 8, of 5,829 tons. The canal has a length from Port Said to Suez of 160 kilometres, a breadth of from 56 to 100 metres at the level of the water and 22 metres at the bottom, and a depth of 8 metres. Further improvements are in progress, to be completed in 1888, and for these a loan of 100,000,000 francs was raised on 8-per-cent. bonds among the shareholders.

Failure of the Anglo-Turkish Convention.—The Conservative Government in England has never repudiated the engagement made by the Gladstone Cabinet to evacuate Egypt as soon as order should be restored. While promising to retire whenever a stable native government should be established, it has taken every practical measure to destroy the authority of the Khedive's government, and has prevented the organization of a native army. The reiterated demands of the Porte and the troublesome insistence of France did not permit the English to ignore their promises. In 1886 Sir Henry Drummond Wolff was sent as a special commissioner to Egypt, and as a special envoy to the Porte, to discuss arrangements for the evacuation of the country. The Ghazi Mukhtar Pasha was sent to Egypt as high commissioner of the Sultan to conduct the necessary inquiries on behalf of the Turkish Government in consultation with Sir Drummond Wolff. In the early part of 1887 negotiations were carried on by the British envoy with the Porte at Constantinople. The Turkish Government demanded before all that a term should be fixed for the evacuation. The English proposed to prolong their occupation for five years more, and then withdraw their troops if the security of the country were not thereby endangered. A proposition for the neutralization of Egypt was considered, the English reserving the right to officer the Egyptian troops, and to march their own forces into the country in case of threatened disturbance. Finally, a convention was drawn up by Sir Drummond Wolff and the Ottoman ministers. The first and second articles confirmed the imperial firmans relative to Egypt, and defined the limits of the Khedive's rights to be such as the firmans prescribe. By the third article the Ottoman Government bound itself to invite the powers to approve a convention for the better regulation of the Suez Canal, which should declare the channel to be neutral and free to the ships of all nations, alike in peace or war. It

was to enjoy immunity from blockade and all acts of war, while the powers were to be asked to agree that no obstacle should be placed in the way of any measures that might be necessary for the defense of Egypt. The fourth article asserted the right of the English Government to maintain troops in Egypt as long as might be necessary for the preservation of order and the protection of the country against internal or external dangers; but by the fifth England bound herself to withdraw her forces within three years from the date of the convention, or, if danger rendered necessary the prolongation of the occupation beyond that period, to evacuate immediately on the disappearance of the danger. Egypt was to enjoy "territorial security," a term that the Sultan considered more consonant with his suzerain rights than the word "neutralization," and the powers were to be invited to sign an act recognizing and guaranteeing inviolability. The fifth article provided also that in the event of external danger or internal disorder at any future time, or of the failure of the Khedive in his duties as a vassal, or in his international obligations, the country might be occupied by Turkish troops, or reoccupied by British troops, each country being bound to notify the other in case of contemplated action, and to withdraw its forces as soon as the reasons for the military intervention should cease to exist. The final article provided that England and Turkey should conjointly invite the powers to approve the convention, and should propose certain modifications in the capitulations and in certain branches of the Egyptian administration which should be especially settled without further discussion. The proposed modification of the capitulations related chiefly to the extension of the jurisdiction of mixed tribunals both in civil and in criminal cases. Another protocol had reference to the passage of foreign troops through Egypt in time of war, should communication by way of the Suez Canal be interrupted. In an annex to the convention it was stipulated that the refusal of any Mediterranean power to agree to the convention before the expiration of the three years should be held to constitute a danger from without, justifying postponement of the evacuation. The Turkish negotiators long resisted the right of re-entry, on which point the British Government remained firm. On Jan. 15, 1887, when the negotiations were reopened at Constantinople, Lord Salisbury sent a dispatch declaring that the British Government would never consent to leave Egypt to the danger of renewed anarchy, or accept as an admissible contingency that the void left by the retirement of the British troops should be filled by the forces of any other power. Finally the Turkish plenipotentiaries agreed to recognize the British right of reoccupation on condition that Turkey should have a concurrent right. The convention was signed on May 22. The British and Turkish Governments had promised to

keep the French ministry informed of the progress of the negotiations. Both Russia and France had protested from the beginning against the recognition of the right of Great Britain to reoccupy Egypt. When the negotiations approached a conclusion the British Cabinet ceased to hold any communications on the subject with the French Foreign Office. The Ottoman ministers, however, continued to consult with the French minister at Constantinople. The convention was promptly ratified by the Queen of Great Britain, but before finally approving the arrangement the Sultan desired to hear the last word from France. After an interview with the Count de Montebello on June 19, the Sultan was presented by him with a note declaring that the French Government would not accept the situation arising from the ratification of the convention, and if the ratification were given it intended to take measures for safeguarding its interests, prejudiced as they would be by the rupture of the equilibrium in the Mediterranean, while if the ratification were refused it would preserve and guarantee the Sultan against the consequences of the non-ratification. The note concluded with the remark that it is only the disinterested policy of France that can safeguard the Ottoman Empire in view of the encroachments and ambitious desires of England. The Russian Government supported the attitude taken by France, and the Sultan suffered the final date fixed for the ratification, June 22, to go by without confirming the instrument. The British ministry, in compliance with the request of the Porte, directed Sir Henry D. Wolff to remain in Constantinople for a few days longer, and then granted further extensions of the period of ratification, but when he had been kept in attendance on the Sultan for a month, and it became evident that the latter was determined to withhold the ratification, and only wished to prolong the situation indefinitely, he was ordered to return to England, and accordingly sailed from Constantinople on July 17.

The Turkish Commissioner.—Ahmed Mukhtar Pasha, who accompanied Sir Henry D. Wolff to Egypt in 1886, remained after the latter departed to report to his Government on the political situation. His reports were entirely adverse to British rule, which he considered to have greatly retarded instead of advancing the development of Egypt. In March he sent a memorandum complaining that the British occupation had brought a swarm of adventurers to the Nile valley, who only seek to make fortunes, and care nothing for the good of Egypt. The higher officials, he said, are arrogant and tyrannical in their demeanor, and pay little attention to serious work. On the failure of the Wolff negotiations he reported that the result had increased Ottoman prestige, and counseled abstention from further negotiations with England respecting the presence of British troops in Egypt.

Neutralization of the Suez Canal.—The provisions in the Wolff Convention relative to the neutralization of the Suez Canal were made the subject of negotiations between the British and French Governments after the failure of the convention. A convention was concluded in October providing for the inviolability of the canal and its ports, and the free passage of the ships of all nations in time of peace or war. The Khedive and the Sultan are charged with the protection of its neutrality. An International Commission is created, consisting of the consuls-general of the powers in Egypt, which shall meet in time of war, and apprise the Khedive if any danger exists that requires him to take measures for protecting the neutrality of the canal. The commission will determine the ports and territory that shall be included in the neutralized zone. In time of peace it will hold a regular session annually, and formally record the continued observance of the convention. Of the sixteen articles composing the instrument, ten had been accepted by the powers at the Egyptian Conference of 1885. The convention, which is to be submitted to all the powers for ratification, stipulates that the canal is not to be subject to blockade, and that no right of war shall be exercised or act of hostility committed within a radius of three marine miles from its ports of entry. The International Commission will be presided over at each meeting by the senior diplomatic agent present.

Benefits of English Rule.—Under the supervision of Sir Evelyn Baring, the British consul-general and adviser of the Khedive, the administrative methods of India have been introduced into Egypt, the authority of the Khedive has been completely superseded, and the ministry has been reduced to a mere instrument in the hands of the foreign administrators. This process has increased the hatred of the Egyptians for their conquerors, but, on the other hand, it has enabled the latter to carry out reforms and improvements that offset to a considerable extent the additional burdens imposed on the people. The land-taxes were formerly collected at uncertain intervals, and the officials often extorted more than the amount of the tax. Now they are collected monthly in amounts varying according to the times of the crops and the ability of the peasants to pay. There is, consequently, a diminution of debt and usury. The use of the kourbash and the bastinado by the tax-gatherers, once universal, is now interdicted. The diminution of the conscription is felt to be a relief by the peasantry, and the abolition of the *corvée* where it was most oppressive saves them from much loss and suffering. The barrage has been completed, new canals have been made, and old ones have been dredged out, with the result that the productive area has been enlarged, and expenses for steam-pumping are much lighter. The administration of justice is much improved. The sanitary con-

dition of the prisons has been greatly ameliorated, and prisoners are no longer incarcerated for years without trial. Although the speedy clearing of the criminal dockets is still impossible, prisoners who have been detained for a number of months can demand a hearing in court to determine whether there is ground for holding them longer. The Code Napoléon has been introduced, and a system of procedure adopted, and eleven European judges have been imported to act as guides to the native judges in applying European principles of jurisprudence. These new native courts came into collision, not only with the consular and international tribunals, but with the Mohammedan religious courts. The Sheikh-ul-Islam and the Grand Oadi claimed jurisdiction in all questions of marriage and succession, and also the right to decide any civil dispute that was brought before them. As a consequence, there arose confusion from contradictory decisions. The conflict culminated in the dismissal from office of the Sheikh-ul-Islam, and the issuance of a decree requiring all civil cases to be brought before the lay tribunals.

Abolition of the *Corvée*.—The condition of the fellaheen has been much improved by the abolition of the forced labor on the canals, in cases where it was most burdensome. The number of men called out for 100 days to clean and repair the irrigation canals was 284,000 in 1882. They were taken away when their labor was necessary for the tillage of their farms, and were often compelled to abandon ripe grain and lose their crops. The English promised to do away with the *corvée*, but were only able to accomplish it by gradual reductions. There were 202,000 summoned for the *corvée* in 1883. In 1886 the number was 95,000. The peasants were not compelled to march from distant places and provide themselves with food away from home, as formerly, but only those living near the works were taken. In 1887 the Government prepared to forego forced labor entirely, but abandoned that purpose, and provided only for the continued partial suppression of the *corvée*. For this the sum of £E250,000 per annum was necessary to pay for cleaning the canals by contract. A similar sum was available from purchases of military exemptions; for so averse are the fellaheen to military service that they will pay £100 or more to escape it. Out of the £5,870,000 to which the administrative expenditures, including the cost of collecting the customs and working the railroads, were limited by the financial convention, it was considered impossible to economize enough to meet the expense of cleaning the canals with paid instead of with forced labor. The decree for the partial substitution of paid labor for another year had been agreed to in principle by the powers in 1886. Yet, when Nubar Pasha in the provisional budget for 1887 proposed to apply the receipts obtained from purchases of military exemption to this object, the French

Government raised a protest, insisting that the revenue from that source should be applied to establishing a native army. The sum of £E180,000 set down in the budget was declared to be palpably inadequate, and the entire budget to be illusory. The protest of France was backed by Russia. The English sought to make the French unpopular by throwing on them the responsibility of preventing the abolition of the *corvée*, and a decree was issued on Feb. 8, 1887, calling out the fellaheen to work on the canals. After further discussion this order was revoked, and the labor was performed by contract. Finally, in August, 1887, an understanding was reached, by which the proceeds of military exemptions should be left intact for the army expenses, but the land-taxes, which in accordance with Lord Northbrook's report were to be reduced by £E420,000, should continue to be levied at the same rates except where they were manifestly too high for the taxpayers to pay them.

The Sarzeaud Incident.—The International Tribunal of Appeal consisted originally of judges representing each of the great powers of Europe, nominated by the Egyptian authorities, and approved by their several Governments, and one appointed from the United States. In 1884 two additional judges were called up from the lower court, without regard to nationality, one of whom was a Greek, and the other a Frenchman named Bellet. In the spring of 1887, the regular French representative on the tribunal, Martin Sarzeaud, was found to be financially embarrassed, and was accused of having borrowed from attorneys practicing before the court, and of fraudulently selling securities that he had already hypothecated. He fled from his creditors, resigning his post, but the Government refused to accept the resignation, bringing formal charges against him. He then sent word from France that he would withdraw his resignation and meet the charges, but soon afterward was drowned by accident or suicide. The English induced the Egyptian ministry to refrain from nominating a successor, on the ground that an extra number of judges was no longer required, but M. d'Aunay protested that France would then be left without a representative on the tribunal. Nubar Pasha proposed then to make M. Bellet the regular French judge, and to abolish the supernumerary judgeship thus made vacant. The French Government declined to accept him, but finally agreed to allow the post to remain vacant as long as M. Bellet continued to be assistant judge, on condition that the office of procureur-général, which would be vacated by the resignation of M. Vacher, should be filled by a Frenchman during the two years required to complete the latter's term. This office had been for many months a subject of contention between the English and the French. M. Vacher had returned to France on account of ill health, but resumed his duties when the

British decided to sanction the appointment of another Frenchman in his place.

Affray between Natives and British Officers.—A party of British military officers who were shooting quail in March, 1887, near the Pyramids gave offense to the villagers, as had often happened, by trampling their crops, and one of the Englishmen accidentally wounded some natives, who were passing on camels. The Egyptians rushed upon the party, and in a hand-to-hand struggle one of the officers shot and killed a native. The sportsmen were overpowered, taken to the village in bands, and subjected to indignities. A court, consisting of the Mudir of the province, the Egyptian procureur-général, and an English officer, went to the village, and, after holding an investigation, condemned fourteen persons to fines and imprisonment, and nine of them to be flogged, which was done by the English military authorities in the presence of the whole village and of the officials of the district, and the regiment to which the officers belonged, which was drawn up to witness the expiation.

The Soudan.—The Government established by the Mahdi is continued by Abdallah Tashî, who calls himself the Khalifa, and has his seat of government at Omdurman. Khartoum has been abandoned, and the material of the houses has been used as fuel for the steamers that were taken to the Upper Nile by Gen. Gordon. In the spring of 1887 the Khalifa's lieutenant, Nejumi, had a force at Dongola, and incursions of dervishes were feared in Upper Egypt.

Osman Digma, who had been appointed the Khalifa's Emir, was encamped near Galabat, where he was scarcely able to hold his ground against the Kabbabish and other Arabs that were friendly to the Egyptians. Nejumi was also hard pressed at times by the "friendlyes," and was reported to have been defeated in a three-days' battle about the 1st of April.

Abdallah sent envoys to Cairo, bearing letters, dated March 16, addressed to the Khedive, the Queen of England, and the Sultan. The letter to the Khedive, which was filled with texts from the Koran, said that God had sent the Mahdi to restore his true religion, and warned the Khedive not to listen to the false sayings, but to embrace the teachings of the Mahdi, or the Khalifa would come and slay him. Abdallah declared that he had no desire for worldly empire, for the Soudan and its riches were his, and that pity alone induced him to send a warning, which, if it were not heeded, would be followed by the occupation of Tewfik's country by the Mahdi's forces. The document was returned to the messengers without an answer, and the Queen's letter was sent back unopened, but that addressed to the Sultan was forwarded by Mukhtar Pasha to Constantinople.

The English troops having been withdrawn from Upper Egypt, the frontier was defended at Wady Halfa by Egyptian soldiers, blacks, and fellahen, commanded by British officers.

The Soudanese, in the latter part of April, attempted a forward movement, but when they had occupied Sarraa, Colonels Chermiside and Barrow marched from Halfa on April 28 with 800 black infantry and 200 cavalry, camel corps, and irregulars, with two guns, surrounded their position, and completely routed the 200 dervishes and 800 Dongolese that had been impressed into the Mahdi's service, killing about 200, including the three leaders, though the dervishes fought stubbornly, checking the first attack.

Osman Digma was no longer able to hold the coast region against the Kabbabish, Hadendowah, and other tribes who turned against him, and when he retired to Kassala, he was surrounded with enemies. In Sennaar and other remote provinces the Mahdi's successor was unable to maintain his authority. The friendly tribes were reported as attacking Osman Digma near Kassala in July, and a severe engagement was said to have taken place, in which 1,200 were killed. Another fight of equal magnitude was reported in August between the Kabbabish and the dervishes in the Baggara country. On the southeast the Mahdists were harassed also by the Abyssinians. Abdallah, nevertheless, maintained his power over a large population, and in October his dervishes again intrenched themselves near Sarraa, and threatened an inroad into Egypt.

Release of Zebehr Pasha.—Zebehr, who has since 1882 been confined as a state prisoner at Gibraltar, was set at liberty on Aug. 8, 1887. He signed an agreement to remain in the place that should be selected by the Egyptian Government, to submit to surveillance, and to abstain from interference in any political or military question. (See **EMIN PASHA.**)

ELECTIONS, LAWS, CUSTOMS, AND THEORIES OF. The antiquity of the ballot is very great. As soon as men associated into bands or communities, it became necessary to determine the opinions of the associators or of some of them. Different methods of determining the sentiments of the voters were arrived at—the simpler being probably the earliest used—such, for example, as by acclamation (or *viva voce*), by show of hands, by the counting of polls, or by the casting of ballots. At Athens several substances were used as ballots; the Dikasts, in giving their verdict, generally used balls of stone (*pephei*) or of metal (*spenduli*). Of these, the ones pierced in the center, or black, signified condemnation; and those unpierced, or white, signified acquittal. Shells, stones, and beans of different colors were likewise used by the Greeks; marked shells (*ostrakon*) were used to drive persons into exile, and from this custom is derived the word "ostracism." The method of voting at Syracuse was by olive-leaves appropriately marked by the voters. At Rome the ballot (meaning thereby the expression of the voter's will by the casting of a designated substance into a designated receptacle) was regulated by the

Leges Tabellariae, a collection or series of laws, of which the *Lex Gabiana* (adopted 139 B. C.) related to the election of magistrates; the *Lex Cassia* (adopted 187 B. C.), to the *judicia populi* (or expression of popular judgment); and the *Lex Papiria* (adopted 181 B. C.), to the enactment and repeal of laws. The ballots in Rome were wooden *tabellae*, or *tabulae*; in the case of a vote on a proposed statute, these were marked V. R. (*uti rogas*), to express consent to the passage of the statute, and A (*antiquo*), to express a desire to keep the ancient or former law. In the case of an election, *puncta* (holes) were made opposite the names of the candidates. *Tabellae* were also used by the Roman judges, who expressed their verdict or judgment by the letter A (*absolvo*) if acquitting, and by O (*condemno*) if condemning, and by N. L. (*non liquet*) if not voting. The earliest known instance of the use of a written paper ballot in Great Britain was in 1662. The Scottish Parliament being desirous of banishing certain persons from the realm, each Parliamentary member wrote in a disguised hand on a piece of paper the names of the persons he thought ought to be exiled. The papers were put into a bag, which was afterward opened in the exchequer chamber, and the ballots were then counted and were burned immediately upon the result being known. In modern times the ballot has generally been of paper, appropriately written or printed upon; but up to within fifty years the French imitated the Greeks and used marbles or bullets as their ballots; and small organizations still use the same systems of colored balls—hence the term “black-balls” as a signification of adverse votes. In the United States, the ballots used at elections are pieces of white paper, printed upon as directed by the laws of the several States.

Ballot-Boxes.—Any receptacle may be used to receive the ballots cast at an election or other occasion of voting, yet in different ages the shape and material of the ballot-box have varied. In ancient times the ballot-box was sometimes of metal in the form of an urn. The Greeks used a brass box to receive the ballots cast, and a wooden box to receive the ballots not cast. The Romans used a wicker-woven box or covered basket. The French, until very recently (voting by means of metallic balls), used boxes with tubes connecting with a larger tube, into which latter the voter put his hand until it was hidden from sight, when he dropped his bullet into one small tube for assent and into the other for dissent. The European nations now deposit their paper ballots in wooden boxes, and this was the custom in the United States up to about twenty years ago. Now we have adopted a box that consists of a glass globe with a movable top, having a slit just large enough to admit a folded ballot. This top is locked down during the voting, and only removed when the votes are to be counted. It is easy to detect any attempt to cast two ballots at once.

Suffrage.—The right to vote has seldom been given to all the inhabitants of a country. The United States is the first country to have made the right of suffrage universal to all her male citizens; but even here there are certain States that impose restrictions upon this right—such as Rhode Island, which, in some instances, requires the voter to have been native-born or possessed of a certain amount of property.

Representation.—Under the system of voting now in vogue in most of the States of the Union, the voter has one vote for each candidate. There are several objections to this method, the principal one being that a very large proportion of the people are left without any representation. To obviate this objection, and to afford the minority some representation, many systems have been proposed, the chief of which are known as: 1. Cumulative; 2. Preferential; 3. Limited; 4. Substitutive; 5. Proxy; and 6. List. Cumulative voting permits an elector to give all or any of his votes to a single candidate; thus, if he is to vote for three candidates, he is allowed to give either one vote to each, or to give three votes for one, or two votes for one candidate and one vote for another. This system is in general use in Illinois, and is said to give general satisfaction. The preferential system first ascertains the number of votes necessary to elect a candidate. Thus, if the total of voters be 800,000, and the number of representatives to be chosen 200, the quota of each representative would be 4,000. Then the voter is to deposit a ballot, on which he shall have placed, in the order of his preference, the names of the candidates. Any candidate receiving 4,000 votes is declared elected. On counting these votes, when a candidate has obtained 4,000 votes, the ballots electing him are laid aside, and the remaining votes are counted for the candidates next in order of preference. If there be not 200 persons credited each with 4,000 votes, the deficiency in the number of representatives is made up by taking the candidates who come nearest to the required quota. This system of preferential voting is used in the election of the Board of Overseers of Harvard College, and its practical working in these elections is said to be very satisfactory and far more simple than would at first be surmised. Limited voting is the plan of requiring the votes to be cast for a smaller number of candidates than the whole. Thus, where a district is entitled to three representatives, each voter can vote for only two representatives. This method is prescribed in the Constitution of New York, in the provision that provides—for the first election of the judges of the Court of Appeals, which election is by general ticket of the whole State—that each ticket shall contain the names of only five candidates. Of course there will always be two tickets, each nominated by a party convention; but the minority party will certainly elect two judges. Substitutive voting permits candidates to cast

anew the useless votes given them, and substitute a third person in their place. Proxy voting permits every voter to give his vote or proxy to any person he pleases. Proxy voting, it is claimed, will result in each elector's exercising the right of franchise. List voting, in some respects, resembles preferential voting. It was first recommended by M. Naville, of Geneva, Switzerland. It supposes lists of candidates, each containing a number of names equal to the number of representatives to be chosen, ranged in the order of preference, to be deposited with the authorities a certain time before election, and numbered. Each elector gives his vote for a particular list. The whole number of votes for that list is divided by the electoral quotient, and the result gives the number of candidates chosen on that list. For example, if there be 15 representatives to be elected, 15,000 voters, and 5 lists of candidates: list A, receiving 5,000 votes, secures 5 representatives; list B, receiving 4,000 votes, secures 4 representatives; and so on.

Registration.—Registration laws require the electors who desire to vote to register their names, addresses, and, in some cases, other personal information, in books or lists provided for the purpose, several days before voting. The object is to afford an opportunity to investigate the right of each person to vote. In some States, special constitutional provision is made for the enactment of registration laws; such States as Alabama, Colorado, Florida, Georgia, Kansas, Kentucky, Louisiana, Maryland, Michigan, Mississippi, Missouri, Nevada, New York, North Carolina, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Virginia, and West Virginia. In Arkansas, Nevada, Pennsylvania, and West Virginia some exceptions are made to the application of the registry laws, and in Texas registration laws are forbidden.

Nominations.—Candidates must be nominated before they can be voted for, and while in theory the right to nominate is open to every citizen, yet in practice the nominations are made by party organizations. The voters of each party and each district meet on an appointed evening, and ballot either for the candidate whom they desire to nominate, or for representatives to some nominating convention. Such meetings are known as primary elections, and while the same general procedure is followed all over the country, there are minor details in which one primary election differs from another. In every election district, however, there are men who, for one reason or another, have become leaders: These leaders hold, prior to the primary election, a caucus, at which they decide who shall or shall not be the candidate nominated, and their influence with the majority of the attendants at the primary is usually sufficient to procure such nomination. In order that the people at large may be given a better opportunity to nominate candidates, it

has been proposed to adopt the Australian system of nomination, which, briefly, is as follows: A candidate is nominated in writing (called a "nomination paper"), which must be subscribed by a certain number of electors. During a certain time, a designated public official furnishes the blank forms of nomination to any voter, and at a certain date all nomination papers that are to be of force must be filed with a designated public official. Only those persons whose names are on a nomination paper duly filed and signed by the necessary number of electors can be voted for. This method recommends itself by its extreme simplicity and the thorough opportunity afforded the people for nomination. The form of the Australian nomination paper is as follows:

We, the undersigned, *A. B.*, of in the of and *C. D.* of in the of being electors for the of do hereby nominate the following person as a proper person to serve as member for the said in Parliament:

Surname.	Other names.	Abode.	Rank, profession, or occupation.
BROWN,	John,	52 George St., Bristol.	Merchant.
JONES,	or William David,	High Elms, Wilts.	Esquire.
MEETON,	or Hon. George Travis, commonly called Viscount,	Swansworth, Berks.	Viscount.
SMITH,	or Henry Sydney,	79 High St., Bath.	Attorney.

(Signed)

A. B.
C. D.

We, the undersigned, being registered electors of the do hereby assent to the nomination of the above-mentioned John Brown as a proper person to serve as member for the said in Parliament.

(Signed)

Procedure of Elections.—The elections in the different States are conducted under the same general procedure. The polling-places are opened at a designated hour, one or more inspectors are present, each candidate or party has some one present to distribute ballots, the voter drops them into the box in the presence of the inspectors (if a registration system is in force, he first gives his name, and it is verified by the list). The polls close at a certain hour, after which the votes are counted. This system is so well known, and may be so easily seen in practice, that no detailed description is necessary here. It has been found to offer numerous opportunities for bribery and corruption of all kinds. Recently, there has sprung up a movement looking to the adoption in the United States of the election procedure now in vogue in Great Britain, known as the Australian system. Briefly, this system is as follows: The polls being open, the voter enters, and gives his name. His right to vote

being ascertained, the chief inspector gives him a ticket or ballot containing all the names of the persons to be voted for. These tickets or ballots are bound in books, which are distributed by an officer designated by law to the several chief inspectors on the morning of election-day. These books are somewhat like the check-books used by the banks, inasmuch as each ballot is connected with a stub (called in England a "counter-foil"), which remains in the book after the ballot is torn out. The following is the form of the ballot:

Counterfoil. No.	1	BROWN. (John Brown, of 52 George St., Bristol, Mer- chant.)
	2	JONES. (William David Jones, of High Alma, Wills, Esq.)
	3	MERTON. (Hon. George Travia, commonly called Vis- count Merton, of Swans- worth, Berks.)
	4	SMITH. (Henry Sydney Smith, of 72 High St., Bath, Attorney.)

Note.—The counterfoil is to have a number to correspond with that on the back of the ballot paper.

Form of Back of Ballot Paper.

No.
Election for.
18 ..

NOTE.—The number on the ballot paper is to correspond with that in the counterfoil.

Each of these tickets or ballots, when it is handed to the voter, is marked by the chief inspector, either by a stamp specially prepared, or by his initials. Having received his paper, the voter goes into a ballot-room, where a pencil is provided, and marks a cross opposite the name of the candidate he votes for. He then folds the ballot so that none can see his mark, returns to the chief inspector, shows him the initial or stamp, and deposits the folded paper in the box. He then leaves by another door, so that he does not come into contact with voters entering to vote. Each polling-place is provided with six or more ballot-rooms. These ballot-rooms are against the wall, at the side of the inspector. They are mere temporary structures, built of boards, about thirty inches wide, and a curtain hangs in the front. A board about a foot wide is attached to the wall throughout the ballot-room, to serve the voter while marking the names. Each pencil is secured by a strong tape. Red lead is preferred, as it is seen better on black printing-ink, and prevents blotting, which would otherwise be inevitable if ink were used to mark the name. A policeman is placed near the ballot-room to show the voters in, and to take care that one voter only enters the ballot-room at a time, and to show the voter the way out. When the voter can not read or write, he informs the inspector of the fact and for whom

he intends voting. The inspector then goes to the ballot-room with him, and marks the names as directed. The voter then folds the paper and puts it into the ballot-box and retires. If the voter inadvertently spoils a ballot-paper, he can return it to the officer, who will, if satisfied of the inadvertence, give him another paper. Any one who fraudulently forges, defaces, or destroys a ballot-paper, is guilty of a misdemeanor, and the punishment for such misdemeanor is fixed at from six months to two years' imprisonment. The same punishment is meted out to any person who, without due authority, supplies any one with a ballot-paper, or puts into any ballot-box any other thing than his ballot, or takes any ballot away from the polling-station, or otherwise interferes with the ballot-box. Every officer, clerk, or agent in attendance at the polling-place must take an oath of secrecy. Immediately after the close of the polls, each presiding officer must return the unused and the spoiled ballot-papers, with a statement showing the number of ballot-papers given him, and the number placed in the ballot-box, unused, spoiled, or illegally tendered. Each candidate may appoint one agent to attend at each polling-place. The State or city or county, according to the election, pays all the expense of the ballots, salaries of inspectors, etc. It will be observed that the ballot given above has a number on the stub and on the ballot-paper; this same number is placed on the registration-list opposite the name of the voter, and this is called the open system of voting. The secret system consists in merely leaving off, from both stub and ballot-paper, such numbering, thus preventing the identification of any ballot. When the polls are closed, the votes are counted as under the existing system.

The Crawford County Plan.—This is a system of conducting primary elections which originated and is still in use in Crawford County, Pa. The plan was suggested and adopted at a county convention of Republicans by C. D. Ashley in 1861. This plan nominates candidates directly at the primaries. It compels them to come before the people and have their merits discussed before the nominating machinery is started. Cleveland, Ohio, is the first large city to adopt the plan (1887). The rules in Crawford County are as follow:

1. The candidates for the several offices shall have their names announced in one or more of the county papers at least three weeks previous to the primary meetings, stating the office, and subject to the action of said primary meetings.

2. The voters belonging to the Republican party in each ward, town, or borough, shall meet on the day designated by the Republican party committee at the usual place of holding elections, at 2 o'clock P. M., and proceed to elect one person for judge and two persons for clerks, who shall form a board of election to receive votes and determine who are proper persons to vote, and shall hold open the polls until 7 o'clock P. M. After the polls are opened, the candidates announced as aforesaid shall be balloted for. The name of each person voting shall be written on a list at the time of voting, and no person shall be allowed to vote more

than once for each office. The ballots shall be numbered and the corresponding number written on the poll-list opposite the names of the voters, and said poll-lists and ballots shall be preserved and returned with the return of each district. Every person claiming to be a Republican who voted for the Republican candidate at the last preceding election at which he voted, and declares his intention to support candidates nominated at such primary election, shall be entitled to vote, and every person challenged, or whose vote is doubted by any election officer, shall be sworn as to the qualifications aforesaid and his oath shall be returned with the return of said district. Any person entitled to cast his first vote at the succeeding general election shall be entitled to vote on pledging himself to support the ticket nominated at such primary election.

3. After the polls are closed, the board shall proceed to count the votes that each candidate has received and make out the returns accordingly, to be certified to by the judge and attested by the clerks. It shall be the duty of the persons holding the primary election, as soon as the count is completed in each district, to make a public announcement of the result, and also to post upon the door of the election-house a statement signed by the election officers, showing the votes received by each candidate voted for at said election.

4. The judge, or one of the clerks appointed by the judge of each district, shall meet at the court-house at Meadville, on the same day following the primary meetings, at 1 o'clock P. M., having the certified returns and lists of voters, and the person having the highest number of votes for any office shall be declared the regular nominee of the Republican party. Whenever any return from any district shall show any more votes, exclusive of the number of persons casting their first vote at such election, than were cast by the district for the last preceding Republican candidate for Governor or President, such excess shall be deducted from such return, said deductions to be taken *pro rata* from the vote returned from the district for the respective candidates for each office at said primary election.

5. Any two or more persons having an equal number of votes for the same office, the return judges shall proceed to ballot for a choice, the person having the highest number of votes to be the nominee.

6. The convention of return judges shall have the power to reject all fraudulent votes from the returns of any district, and where frauds have been committed or allowed by the board of election of such a nature and extent that it is impossible to determine the true vote of a district, the convention may reject altogether the return from such district.

7. The return judges shall have power to appoint conferees, senatorial and congressional, or either, as the case may be, who shall be recommended to support the person who shall have received the highest number of votes cast for that office in the county.

8. The return judges may, at any time, change this mode of selecting candidates as they may be instructed by the people at the primary meetings, due notice of such proposed change having been given by the county committee.

9. It shall be the duty of the chairman of the county committee to issue a call for the primary meetings in pursuance of the action of the county committee, to print and distribute blanks for returns, poll-lists, and oaths, as required by the foregoing rules. It shall be the duty of the chairman of the county committee to call a meeting on the request in writing of ten members.

Under the rules printed above, the names of all the candidates for each office who have given due notice of their candidacy are printed on the ticket to be used at the primaries. The blanks include one for a statement of the vote for each candidate at each primary, a tally-

sheet for the use of judges and clerks of election, a return-sheet to be sworn to and be forwarded to the return judges, a blank for recording the names of every voter, a blank affidavit to be subscribed by voters whose politics are in doubt, and another for the judges and clerks, and envelopes for forwarding the returns.

The Clarion County Plan.—This is named from Clarion County, Pa. It allows each ward and township represented in a Republican primary one vote for each 50 votes cast at the last election for the Republican candidate for Governor. At the primary elections the voters cast their votes directly for candidates not only for first choice, but for second and third choice also. They elect a delegate to the county convention, who is also the representative of the ward or town on the county central committee. The delegate is required to cast the vote of his constituency as already expressed for the several candidates. For instance, if the ward cast 500 votes for Governor it would be entitled to 10 votes for each office to be filled without regard to the aggregate number of votes or the number of votes for each candidate cast at the primary election. If the convention is to nominate a candidate for Congress, the delegate will cast the 10 votes of his ward or township for the candidate who had the highest number of votes as first choice so long as he remains a candidate. If this candidate is retired, the 10 votes must be cast for the candidate who has the highest number of votes for second choice at the primary election so long as he remains a candidate, etc. At the convention the candidate having the smallest number of votes on the first ballot is dropped and the votes cast for him go to some other candidate, and so on until one has a majority. In this way a nomination is certain to be made on the second or third ballot.

EMERY-WHEELS. A generation ago the uses of emery were confined to the polishing and grinding processes possible with powders of various degrees of fineness. Every woman had in her work-basket a little cushion or bag of powdered emery, to remove particles of rust from her needles. Mechanics used the same powder in various forms, such as emery-paper and emery-cloth, the powder being fixed to the cloth or paper by means of glue. Wheels were made with the periphery covered with emery-powder, and polishing sticks and rods, similarly covered, are still in common use. The new industries and mechanical processes, so universal to-day, are of comparatively recent origin, and have grown out of the obvious advantages resulting from the introduction of solid emery-wheels. Twenty years ago these wheels were few, and were viewed with distrust by most workmen, owing to real or fancied imperfections of manufacture, and consequent danger to the workman. A long series of experiments was tried before even approximate perfection was attained. To se-

cure the best mechanical results, a very high rate of speed was necessary, and immense difficulties lay in the way of securing adequate cohesion of the particles. Rubber, glue, shellac, oxidized linseed-oil, and various metallic and mineral cements were tried, with varying degrees of success. Among the earlier devices was a composition of emery with melted brimstone; but the friable character of this was so effectually demonstrated by frequent accidents, that its use was speedily discontinued, and years passed before the record of precedence was forgotten. The soluble silicates were tried at an early date, and with promising, but not wholly satisfactory, results. Some of the earlier experiments hinged upon the chemical affinities and interchanges of the oxides and chlorides of zinc, magnesium, and other bases, and many failures resulted, owing to the unknown and unexpected changes that went on silently beneath the exterior surface of the wheel, and only made themselves manifest after a lapse of time altogether uncertain in duration.

An instance is mentioned, on good authority, where a manufacturer kept samples of all the wheels sent out from his establishment, and found after a time that they had fallen to pieces on the shelf where they were stored. Another difficulty encountered by the early manufacturers was the warping of wheels, particularly those that were thin. It was found that this was due to turning the sides first and the face last. A reversal of the process corrected the tendency. The main difficulty, however, lay in the composition. Vitrification, it was found, was inseparable from a degree of brittleness incompatible with sufficient cohesion, and it appears that upon the whole tanite and vulcanite wheels give the best results. The secret of the details of manufacture of all the best makers is closely guarded to this day; but it is known that success was reached only through a long series of careful experiments. The terrific force of an exploding wheel is little appreciated save by the workmen who are obliged to stand over them, and by the employers who are, or ought to be, responsible for their safety. The testing-room of one of the largest manufactories of emery-wheels is similar to a bomb-proof for strength. Its walls are of stone, $8\frac{1}{2}$ to 4 feet thick, and the roof is made of heavy oaken logs covered with loose stones. The testing-machine is run by a belt, which passes through a narrow slit in the rear wall, and can be thrown into and out of gear by a person outside of the building. The test-speed applied to the wheels is largely in excess of any to which they are likely to be subjected in practice, and when they break in the testing-room they strike the walls and roof with the force of artillery, splintering the stone and penetrating the solid timbers. There is, in fact, no safe-guard except the intrinsic cohesiveness of the wheel. Hoods, cowls, and screens can not be made heavy enough to

withstand the shock, and side-flanges can not be so tightly adjusted as to restrain the fragments of a broken wheel, responding to a centrifugal force of 1,500 or 1,600 revolutions a minute.

All this elaboration of experiment and precaution presupposes an enormous demand for a trustworthy manufactured article. In point of fact, the solid emery-wheel has already superseded the file, and all other methods of grinding and polishing on a large scale. An elaborate series of experiments have been instituted to establish the comparative merits of the old and new methods. Perhaps the most striking of the results is found in a table comparing the cost of wearing away one pound of brass, cast-iron, wrought-iron, and steel, respectively, with a file and with an emery-wheel. Skilled workmen were employed accustomed to the use of the file, and they worked as rapidly as possible to wear away the required pound of filings and chippings in the shortest possible time, without regard to the shape in which the metal was left.

COST PER POUND OF REMOVING OR WEARING AWAY METALS.

TOOLS.	Brass.	Cast-iron.	Wrought-iron.	Steel.
	Cents.	Cents.	Cents.	Cents.
Emery wheel	1.9	5.8	21.9	28.9
File	25.8	85.9	75.	206.4
Hammer and cold-chisel	10.1	5.5	19.6	187.6

A careful comparison of these results shows very largely in favor of the wheels. While every stroke of the file or chisel diminished the cutting power of the instrument, the wheel remained as good as new at the end of the trial. The wheel is in fact a circular file, costing $2\frac{1}{4}$ cents a pound, while files cost about 16 cents apiece. The speed of the wheel during the test-trials was 1,660 revolutions, or about one mile a minute measured at the cutting-edge.

Emery-wheels are made of all sizes, from the size of a shirt-button up to 36 inches in diameter, and of various thicknesses, according to the work required of them, which may be simple saw-gumming, or grinding the treads of car-wheels, evening plate-surfaces, or other heavy work. The mounting of the wheels to secure the utmost durability and immunity from fracture is of the highest importance, and has called for the exercise of much ingenuity in bringing them to their present state of perfection. Vibration has been reduced to a minimum, and the breaking of a good wheel when properly mounted is now a rare occurrence. Wheels when fresh from the factory are, or should be, absolutely true, but the wear of usage is apt to make them somewhat uneven. This is easily corrected by the use of a diamond tool, which is the only instrument that can remove the inequalities and reduce the cutting-face to its normal condition. Wheels are made with edges of various shapes,

and they can be cut to all sorts of re-entrant and irregular angles and curves by any mechanic with a diamond tool. So easy is it, indeed, for the workman to shape the wheel according to his needs, that by far the greater proportion of wheels are made with a plain, square face like an ordinary grindstone.

EMIN PASHA. The expedition of Henry M. Stanley for the relief of Emin Pasha, undertaken in the spring of 1887 awakened general public interest. The fact that an able and active explorer, well known to all the geographical societies of Europe, was, so to speak, cast away in Central Africa and unable to return to civilization, was most romantic. Little had been publicly known of the personality of the explorer prior to the general discussion awakened by the organization of this expedition, and even now but few persons are thoroughly informed regarding his career. Emin Pasha is an Austrian, his real name being Schnitzer, and was born in 1840, at Oppeln. After studying medicine for a time at Breslau, Berlin, and Königsberg, he was appointed in 1868 a surgeon in the Turkish army. It has been said that upon receiving this appointment he embraced Mohammedanism, but there is no positive evidence of it. He was sent to Egypt and was appointed by Gen. Gordon surgeon-general of his army. In 1878 he was made Governor-General of the Equatorial Provinces, with the title of Bey (being afterward promoted to Pasha), and immediately set out for the provinces over which he was to rule. Here his remarkable energy and quick grasp of the situation became evident at once. These provinces were at the time of his assumption of authority in a terrible condition. A vast territory, containing six million inhabitants, had been for years overrun by the slave-traders, who did an enormous business in kidnapping or buying the natives and taking them to the nearest slave-market. Within three years Emin had driven the slave-traders out of his dominions, while the provinces, which up to his acquisition of power had cost for their government nearly \$200,000 annually, were able to send in 1882 and thereafter a yearly surplus of \$40,000 to the Cairo Government after paying all expenses, besides the cost of large public works which had been completed. This change in the financial condition of the territory was brought about, not by increased taxation, but by the exercise of economy and the suppression of abuses, by training the natives to become industrious producers, and by the general exercise of good government. The new Bey devoted himself to the study of the language and customs of the races over whom he ruled, while with wise judgment and a kindly nature he taught the natives to have full confidence in him. Training-stations were established all over his provinces, agriculture was developed, and murder, war, and slavery became things of the past, so that at last, as is said, "the whole country was made so safe that but for

the wild beasts in the thickets a man could have gone from one end to the other armed with no more than a walking-stick." Emin's idea of government was to civilize the negroes in as short a time as possible and by the exercise of methods of kindness and consideration. To this end he appointed the most efficient men he could get as officers, and these enforced a strict discipline, treating the natives as children, but yet gently. Hospitals were built, roads were constructed through the country, the natives were taught how to make wagons, and cotton, coffee, rice, indigo, and wheat were cultivated with success.

In the mean time the country surrounding the territory of Emin remained in its original condition of barbarity, and there the Arab slave-traders carried on their infamous traffic unmolested. These slave-traders had been the bitter enemies of Gordon and were now the most active supporters of the Mahdi, and it was these that created for Emin his greatest difficulties. On first reaching Wadelai he succeeded in forming friendly relations with the kings of Uganda and Unjoro, and the latter continued faithful to him up to the last that was heard of him; but in Uganda a new king came on the throne who was under the influence of the Arab slave-traders and hostile to the missionaries, and he was able, with the assistance of native tribes in various directions, to imprison Emin in his own territory, so that from 1882 he was entirely cut off from communication with the outside world. To the north of him the Egyptian rule had been destroyed, while the hostile King of Uganda prevented assistance reaching him from the south. It was not until October, 1886, that such news came from him in letters which he succeeded in getting through in the hands of negro runners as to set forth clearly the nature of his situation. At that time he had ten fortified stations along the Nile, while his command consisted of 1,500 soldiers, 10 Egyptian and 15 negro officers, and 20 Coptic officials. He expected that his ammunition would last until the end of 1886, and that he would be able to maintain himself still longer if not attacked by the wild tribes; but this latter event he feared as well as that he would be assaulted by the tribes of the Mahdi as soon as it was discovered that he had no more ammunition. Meanwhile, Emin could have escaped on his own account by taking picked men and cutting his way through had he been willing to leave the women and children to their fate and the natives to the mercy of the slave-traders; but this idea seems never to have occurred to him, and in the last letters received from him he made no appeal for assistance, but simply said that if a relief force should be sent to him it would save his life and prevent his provinces from lapsing into barbarism. He kept his men busy in the cultivation of cotton, taught them how to make boots, and established a soap-factory and tobacco plantations, placing his

forces toward the Upper Nile, his natural line of retreat, and thus succeeded in retaining his sway over the southern and eastern districts of the ancient province of the equator.

Dr. Junker, the Russian explorer, left Emin Bey on Jan. 1, 1886, and after encountering many dangers reached Europe. It was his account that called the attention of the world to the perilous position of Emin. It was known that in the spring of 1882 Emin went down the Nile to Khartoum to consult in regard to the Mahdi, but was instructed to return to his provinces and defend himself as best he could. This he did, but he was gradually forced to relinquish outlying stations, though losing ground only on compulsion, and at last accounts he was at Wadelai, near Lake Albert Nyanza. His last letter contained the following: "I am glad to be able to tell you that the province is in complete safety and order. It is true that the Bari gave us some little trouble, but I was soon able to restore order in their district. Since I last wrote you all the stations have been busily employed in agricultural work, and at each one considerable cotton has been planted and is doing well. This is all the more important for us, as it enables us to a certain extent to cover our nakedness. I have also introduced the shoemaker's art, and you would be surprised to see the progress we have made. We now make our own soap, and we have at least enough meat and grain, so we have sufficient to keep life going. Such luxuries, however, as sugar, etc., of course we have not seen for many a long day. I forgot to say that we are growing most splendid tobacco. . . . Our relations with Kabraga, King of Unjoro, have still continued friendly. He has also had the goodness to send my letters to Mr. Mackay in Uganda, and has permitted me to buy several necessary articles from the Zanzibar Arabs who live in his country."

Since that period Emin's position has not become any worse, as Dr. Junker succeeded in sending him from Uganda \$2,000 worth of cotton goods, and afterward goods were bought by Emin's agents in Uganda, while, under date of Dec. 18, 1886, he wrote to Dr. Junker that King Mwanga allowed him to buy goods from Zanzibar merchants, and that he obtained permission to have ammunition and provisions sent to him from Zanzibar.

This part of the continent forms one of the large plateaus that give Africa its peculiar character. An immense highland occupies the continent south of a line drawn from Abyssinia to the Niger. Its rim is formed by mountain-ranges that fall off in terraces toward the sea. A depression, indicated by the valleys of the Kunene and Zambezi, separates the plateau of South Africa from that of Central Africa. The eastern side of the latter consists of high mountain-ranges and plateaus. This mountainous district contains the sources of all the rivers of Central Africa except the

southern tributaries of the Congo, which come from the water-shed between the Congo and the Zambezi. Emin has explored the greater part of his territory. He made his first excursion in 1876, with Gordon. In 1877 he went from his station of Lado to Lake Mwanan, passing by Dufleh, and returning by way of Unjoro and Rubaga. In 1880 he explored the Makraka country, in 1881 the Lattuka territory east of the Nile, and in 1882 the Uelle. He is a hard worker, passing long hours in his office, gives receptions, makes inspections, and when his official occupations allow him leisure he writes his memoirs and the results of the geographical, physical, ethnographical, and metallurgical observations made during his frequent tours of inspection, transmitting them, whenever some trader passes, to the German scientific reviews. His present stations include Lado, Redjaf, Bedden, Keri, Labos, Dufleh, Fatkio, and Wadelai.

On receiving Dr. Junker's account of the situation of Emin, a great deal of feeling was aroused in England and Germany and in Egypt, and the necessity of fitting out a relief expedition was universally conceded. Different plans were proposed; but, while King Leopold of Belgium and the Khedive of Egypt were both willing to assist, nothing positive was done until a Mr. Mackinnon, of Glasgow, and some other Scotchmen subscribed a fund of \$100,000, and called for Henry M. Stanley to take charge of it, and undertake the expedition. Stanley was engaged at that time in a lecturing-tour in the United States, but immediately canceled all his engagements and sailed for England, and in ten days left for Zanzibar by way of the Suez Canal. This was on Feb. 3, 1887. Twenty days after arriving in Zanzibar, the relief expedition sailed in the steamer "Madeira," by way of the Cape of Good Hope, to the mouth of the Congo. The expedition included 61 Soudanese, 18 Somalae, 620 natives of Zanzibar, 8 interpreters, and 40 of Tippoo Tib's followers. With Tippoo Tib, the great Arab slave-trader, Stanley succeeded in making an agreement by which he was to accompany him as second in command, an arrangement that was pronounced by the London "Times" "a master stroke." Tippoo Tib, an ivory- and slave-hunter, is a most powerful factor in Central Africa. In men and means his resources are said to be practically unlimited. His agents are found in all directions throughout the country, while he has factors in Muscat and India, to whom every year he sends vast stores of material for trade. The Stanley expedition arrived at Cape Town on March 9, and proceeded on the following day to the Congo river. In the mean time news had been received at Zanzibar from Emin Pasha, to the effect that in the preceding November he went to Uganda, and that King Mwanga refused to permit him to go through his country. Then Emin tried to effect a passage at Karagwa, on the western shore of Lake Victoria Nyanza; but in this also he failed. He then returned to Wadelai, leaving a

detachment of soldiers at Unjoro under the command of Oasati, his sole European companion.

There were four routes, any one of which Stanley could take for his expedition: one straight through the hostile Uganda country, the second through the Masai country, a third more southerly by the shores of Lake Alexandra, and the fourth by the Congo. He chose the fourth. The steamer "Navarino" carried his merchandise and ammunition from Gravesend to the starting-point of the expedition, and thence to the mouth of the Congo, where the Belgian steamers, loaned by King Leopold, were to transport everything and everybody to within 250 miles of Wadelai, thus reducing by about three quarters of its distance the march to be made overland—an immense advantage, considering that every article has to be carried on the backs of porters from the sea to the objective point. Stanley took with him a transportable steel boat, about 80 feet long and 6 feet broad, which could be separated and easily carried by two men, and when in use could carry 22 men and 1,000 pounds of baggage. He was also provided with a modern automatic Maxim gun, which can discharge 666 bullets every minute, with a range of about 2,000 yards, and which is provided with an armor-plate as protection against assault by arrows and spears. Altogether the expedition embraced about 1,000 people. Arriving on the Congo, Stanley dispatched couriers overland to the King of Uganda, informing him of the object of the expedition, and to Tippoo Tib at Stanley Pool. He found the latter at Stanley Pool, virtually in command of the whole country, and at once completed the arrangement already mentioned. This was rather forced upon Stanley, as he found that since his absence from the country the power of the Congo Free State had been crippled at most of the outposts. The Belgians, who had everywhere been left in charge, seemed to have proved quite inefficient for the work left in their hands. Stanley Falls Station had been destroyed, and all around that neighborhood the savages were in hostile humor.

The expedition left Bolombo on May 11, and it was expected that it would arrive at the mouth of the Aruwimi the first week in June. At this point Stanley proposed leaving the Congo and pushing on overland through the unexplored territory 350 miles to Wadelai, where Emin Bey was supposed to be encamped. On Dec. 30, 1887, Dr. Schweinfurth, the explorer, wrote from Cairo to Berlin that news of the junction of Stanley with Emin had reached Cairo on Dec. 22, but without further particulars. It should be mentioned that the Egyptian Government gave £10,000 toward the purpose of the expedition, not for the rescue of Emin, but for carrying dispatches and ammunition to him.

The general feeling among experts in Central Africa exploration was that in choosing the Congo route, which has 350 miles of dan-

gerous and difficult unexplored country, Stanley would find that he ran great risks. Sir John Kirk, British Consul-General to Zanzibar, said: "The Congo route by Mobangi or Biyerre is impossible. No one is able to say how many months such an expedition would take. Besides, it would be necessary to bring porters from Zanzibar, for the Congo negroes are not used to that sort of work. The Congo Free State depends even now upon Zanzibar negroes for labor." Gen. Charles P. Stone, formerly chief-of-staff of the Egyptian war establishment, expressed the opinion that "a well-organized expedition, thoroughly prepared with such full information of the route, the obstacles, and the dangers as can be given by Dr. Junker, commanded by such a man as Stanley, who is thoroughly acquainted with these countries and their population, starting in a favorable season, could effect the rescue, provided Emin Pasha could hold out for the necessary time, which Dr. Junker feels he can do." If this expedition should fail, the result would be to hand over to the slave-traders a population of 6,000,000 and a province nearly as large as Europe.

ENGINEERING. *Bridge at Poughkeepsie, N. Y.*—Ever since the first settlement of North America the Hudson river has been one of the chief arteries of commerce. Forming with its main tributary, the Mohawk, the most direct route from the sea to the Great Lakes and through them to the West, it has for upward of two centuries been the main highway of emigration. The canoe and bateau have been successively superseded by the canal-boat, the steamer, and the railroad. It must ever remain a natural highway for traffic, but with the development of artificial as distinguished from natural highways, it has assumed a new character as an obstacle. A glance at the map will show that it divides New England from the West in a way that does not at all harmonize with the demands of modern economic engineering. For many years it has been bridged at Albany, but there remained a long stretch of 150 miles involving either an indirect course by rail, or the transshipment of freight and passengers at New York.

Several schemes for bridging the river at Peekskill, Fishkill, and Hudson have been proposed, but that at Poughkeepsie is the first that has been pushed to a successful issue. The bridge was designed about 1870. It has four piers of masonry resting upon timber caissons which are dredged to a depth of about 125 feet below high water. The dimensions of these caissons are 60 feet by 100. Twelve pockets were left open for convenience of workmen, and were filled with concrete after the caissons were sunk to their final level. The tops of the caissons proper are 20 feet below high water, and are surmounted by grillage-work 10 feet deep and closely corresponding in area with the caissons themselves. The solid masonry piers are 24 feet thick and 86

feet long, and rise 80 feet above high water, affording support for steel towers 16 feet by 60 at the base, 16 feet by 80 at the top, and 100 feet high to the lower part of the superstructure. The

tower construction is shown in the illustration, consisting, in effect, of two pyramidal structures securely braced in every direction. The cantilevers are three in number, of 548 feet each, and two connection spans of 525 feet each. It will be noticed that the two end spans and the central span give a greater clear height above the water—namely, 180 feet—while the connected spans give 180 feet, a plan which facilitated the placing of the cantilevers without staging, and therefore with less obstruction to commerce. The wind-pressures are estimated on the basis of 80 pounds per square foot of surface, including towers, spans, and area of trains. The pressure on the caisson bases is about 8 tons per square foot, and the material upon which they rest is hard gravel.

From end to end, including approaches, the structure is about $1\frac{1}{4}$ mile long, and it is an excellent example of the latest ideas in bridge construction.

The Tay Bridge.—Some of the ingenious devices for laying the foundations of this grand bridge were described and illustrated in the article on engineering for 1885. The year 1887 saw the completion of the whole structure, and trains were passed over it early in June. Throughout the whole course of construction the ruins of the old bridge, which fell in 1879, were utilized, and the engineers were thus enabled to dispense with

BRIDGE AT FOUCHERETPUE.

scaffolding more easily than their brethren who are engaged in a similar task on the Firth of Forth. Mr. William Arrol was the supervising engineer of the whole work, and he has discharged his duties so satisfactorily that his place as a bridge engineer is assured. As regards the possible recurrence of such a disaster as startled the civilized world in 1879, all confidence may be felt. A wind-pressure of 55 pounds per

bridge can be opened in five minutes. Capstans are provided for operating the mechanism by hand-power in case of necessity, the time required being seventeen minutes. The structure was opened for public use on May 22, with imposing ceremonies. The distance between the axes of rotation is 220 feet (nearly). The total weight of the iron-work is 526 tons, with a counterbalance of 58½ tons. The clear

LIFTING BRIDGE AT TARANTO, ITALY.

square foot has been provided for, and every part of the foundation has been tested to one third more than the greatest possible load that can be placed upon it.

Bridge at Taranto, Italy.—A strait separates the old and new towns of Taranto, and connects what is known as the Little Sea (Mare Piccolo) with the Gulf of Taranto, both of classic fame and of considerable maritime importance. The bridge recently finished was constructed with a view to the ready passage of large vessels. It consists of two half-arcs meeting above the middle of the strait. Each half is moved by machinery driven by two turbines of 14-horse power. The halves are raised and rotated, the lifting motion being given by four nuts worked by an endless screw, and the rotation effected through large wheels at the end of the abutment. The turbines are driven by water from a reservoir, and the

distance between abutments is 188 feet. A test-load of 280 tons was left for 24 hours upon the bridge, and caused a deflection of less than 8½ inches, or about half what was allowed in the specifications. On the removal of the load, the deflection disappeared altogether.

Stiffened Suspension Bridges.—A peculiar type of suspension bridge, known as Garson's patent, has been adopted by the British authorities in India, which is believed to secure greater stability with less weight of metal, for small bridges, than any previously adopted plan. The usual plan has been to adopt side girders for small suspension bridges, but this involved too much weight and too great cost. The distribution of stress is stated as follows: *Upper chain.*—Stress at center equal to zero, increases toward piers until it reaches a maximum. *Lower horizontal member.*—Stress at abutments equal to zero, increases toward center, where it

STIFFENED SUSPENSION BRIDGE.—SIDE VIEW.

reaches a maximum. *Diagonal braces.*—Stress horizontal, almost equalized, and of small amount. The bridge is hinged at the center, so that it can rise and fall with changes of temperature. The pins are of wrought-iron or steel, and are hinged at the base and connected at the summit, so that the stress on them is always axial. The stress on the foundations is purely in the nature of a vertical load.

The bridges are built in Glasgow in 70-foot spans complete, and are delivered in Calcutta for \$625 each, the weight being 137 cwt.

STIFFENED SUSPENSION BRIDGE.—CROSS SECTION.

Other notable bridges are finished or in course of construction, namely, across the Harlem river at 181st Street, New York city, across the Missouri river, near Kansas City, and the Rulo Bridge over the same river. The Hawkesbury river bridge in New South Wales is well under way in charge of American contractors, and it may be said, in conclusion, that American systems of bridge construction are commanding the respectful attention of engineers the world over.

Suspension Foot-Bridge at Oak Park, Ill.—Among the feats of noteworthy amateur engineering is a bridge described by the "Scientific American" as the work of amateurs, young men "just in their twenties." It crosses the Desplaines river with a central span of 125 feet. One bank of the river is a bluff, upon which a concrete tower was erected. On the other bank an elm-tree, having double trunks nearly side by side, was used, the bridge passing between them to a concrete anchorage 75 feet distant. The anchorage on the bluff side is afforded by an oak-tree, to which the cables are made fast near its base. The cables are five eighths of an inch in diameter and are four in number, two of them being merely auxiliary. The footway is about four feet wide, and the whole structure weighs only 2,750 pounds. It has borne a test-strain of fifteen men standing together upon it, and is constantly used by foot-passengers as means of transit.

Dams.—The near completion of the Vyrnwy dam in Wales, for the water-supply of Liverpool, England, and the beginning of work on the great dam at Quaker Bridge, N. Y., for the supply of New York city, are among the largest engineering works of the day. In connection with them it may be well to consider the other great dams of the world, ancient and modern, for the construction of reservoirs dates back to prehistoric times, and bore a conspicuous part in the oldest civilizations. Herodotus describes the lake of Moeris as formed by the Egyptians for husbanding the surplus of the Nile floods, and within a year or

two there has been some talk of reconstructing the ancient canals and restoring the lake to its former usefulness. The same writer mentions the reservoir of Nebuchadnezzar at Sippara, which is said to have been 140 miles in circumference—a statement that must be taken with some grains of allowance. Certain it is that in Egypt, Asia, India, Ceylon, and China, vast works were executed for the retention of the surplus rain-fall of the winter months. Some of these ancient earthworks and masonry have wholly disappeared, but traces of others still remain. Conspicuous among them are the reservoirs of Cummum, Kala-Weva, and Horra Bera, in Hindostan. Most of the dams are in ruins now, but have been surveyed, and evince a very creditable degree of engineering skill. The first named, though perhaps the oldest, is still serviceable. The embankment is 102 feet high, with a breadth on top of 76 feet, and a base of about 300 feet. The lake that it created, when perfect, was about 15 square miles in area. The ruins of the dam of Kala-Weva are 12 miles long, and the lake, when full, must have been 40 miles in circumference. That of Horra-Bera is from 50 to 70 feet high, between 8 and 4 miles long, and controlled a lake 8 or 10 miles long and 3 or 4 miles wide.

The advance from earthwork to masonry marks a long step toward theoretical perfection. Most of the great masonry dams have been constructed within the present century. Sections of several of them are shown on the next page in outline, resting upon a common base for ease of comparison, and having a scale in feet at the left.

The Puentes Dam, No. 5, is in Spain, and is almost identical in its elements with the Alicante dam in the same country. Its height is 164 feet, and its width 65 feet at crest. It was built about three centuries ago. The sides of the valley at Puentes were rock, but the bottom was untrustworthy, and a heavy arch of masonry was thrown across, springing from solid rock, and upon this the dam was built, the under space being filled in with walling. The locality was liable to sudden and violent floods, and probably the great width at top was provided in view of unavoidable overflows, covering the entire extent of the dam and calling for great weight, the elements of pressures not being fully understood at that time. It was not practicable to construct side overflows. A very large amount of sand and silt is brought down these streams, and to get rid of it a somewhat primitive method was adopted. Two openings were provided at the base of the dam, the upper end being stopped with loose timber, while the lower end was closed by iron doors. When the accumulation of silt necessitated flushing the dam the iron gates were opened, and workmen sent in to break out the timber screen. If they had good luck it was hoped that the silt would keep back the rush of water long enough for them

to escape, but, if not, they must take their chances.

Of modern dams, that at Furens is the most famous of those actually finished. It was built from designs by Messrs. Graiff and Grand-

SECTIONS OF GREAT DAMS.

Champs between the years 1859 and 1866, and was intended partly to protect the town from freshets, and partly to afford a perennial water-supply. Its cross section is shown in the engraving. Its plan is a curve on a radius of 828 feet from a center on the down-stream side. It is founded on compact granite, a trench 8 feet deep having been quarried out to prevent slipping. The material is rubble masonry, laid in courses of 5 feet, and carried up to a height of 184 feet. At the base it is 110 feet thick, and 9 feet 8 inches at the crest. The calculations aimed for a pressure of about 95 pounds to the square inch. The dam contains about 52,000 cubic yards of masonry, and the cost of erection was \$180,400. The capacity of the reservoir is 352,000,000 gallons. The reservoir discharges its surplus water through two tunnels, leading through a hill into an adjacent valley, where such power as is constant is usefully employed.

Another famous structure is the Gileppe Dam at Verviers, Belgium, No. 3. It was finished in 1875, under the supervision of M. Bodson. It differs largely from the Furens section, and, indeed, from the best theories of dam-construction. This was rendered necessary by the anxiety of down-stream residents, who strongly opposed the construction of the dam, on the ground of danger. It is laid on an arc, described by a radius of 1,640 feet, with a length of 771 feet. The reservoir contains 2,701,687,000 gallons, nearly eight times as much as the reservoir at Furens. The founda-

tions are carried down into solid rock. Its total height is 154 feet, and the width of the crest, which carries a roadway, is 49 feet. The base is 216 feet thick. The outlet pipes, always a source of danger, are carried through a hill at some distance from the end of the dam.

Another great Spanish dam is on the river Lozoya, and supplies water to the city of Madrid. It is known as the Villar Dam. The capacity of its reservoir is 4,400,000,000 gallons, nearly thirteen times that of Furens. It is built on a sharp curve, the radius being 440 feet, and the length of the dam, on the crest, 546 feet. A curve like this probably adds considerably to the strength of a short dam. The material is rubble masonry in hydraulic mortar, costing \$402,780.

The Vyrnwy Dam, shown in section in No. 4, crosses the Vyrnwy river in North Wales. The area that will be flooded is, or was, a charming region, largely occupied by villas and country-seats, and, of course, involving a large amount of outlay in property rights. The dam will impound an area of 1,115 acres. It is 1,255 feet long, built of Cyclopean rubble set in mortar, and with the interspaces filled with cement-concrete. The individual masses weigh from 2 to 8 tons each, and it is calculated that this method of construction will give exceptional solidity to the wall. The upper face of the dam is coated with cement. The height is 146 feet, and the breadth at base 117 feet 9 inches.

A large dam is building at San Mateo, Cal.,

CROTON WATER-SHED.

designed for the water-supply of San Francisco. It is 170 feet high, 176 feet thick at the base, and 20 feet wide, being in shape very much like a truncated pyramid.

No. 6 represents another variety of what may be termed the square-block type of dam, which appears to have been a favorite with Moorish engineers. It is known as the Val d'Inferno, and is in the province of Sarco, Spain.

The dam at Quaker Bridge, N. Y., shown in the diagram, towers above all other structures of the kind, actual or prospective. The lake that will be created will include the present reservoirs, covering the existing dams to a depth of many feet. It will contain something like 40,000,000,000 gallons of water, more or less—a matter of a few million gallons is of small moment where such amounts are concerned. It is estimated that the dam will impound the whole rainfall of the Croton watershed, and will afford an ample supply for the city, even if no rain at all falls for a period of several months. The plans and calculations for this vast structure were drawn by Benjamin S. Church, chief engineer. The estimated strength of the wall is about double what it will ever be called upon to bear. The Croton water-shed, as may be seen from the map, is an irregular valley about 25 miles long by 12 or 15 miles wide.

The dam proper will be 1,350 feet long on the crest, rather more than $\frac{1}{4}$ of a mile. It will rest in a ditch, quarried out of the solid rock, 216 feet wide at the widest part, and will have an extreme height of 277 feet, decreasing to nothing at the wings. The dam will not be laid on the arc of a circle, that plan being regarded as obsolete for a structure of this size, however it may add to the stability of a short span like that at Furens. The dam is planned to resist by sheer weight any possible pressure that can result from the accumulation of water. The idea that the extent of area increases pressure is wholly erroneous. The pressure of water is due to its depth, not to its extent, as may be readily seen by reference to any authority on hydrostatics. The danger from a large impounded body of water arises, not from the increased pressure upon the restraining dam, but from the cumulative rush of water after a break has occurred. In an earthwork dam, a trifling leak may spread with disastrous rapidity and carry away the whole structure; but a masonry dam, if properly constructed, might be split from crest to base, and would remain in position while the water trickled through the crack.

While the dam is in process of construction, the natural overflow of the Croton river will be confined to an artificial channel running along the side of the valley. An unavoidable danger from freshets must exist while the work is going on, but the habits of the river have long been under close scientific scrutiny, and with existing re-

sources it is unlikely that serious interruptions will occur.

The system of construction is simple. The first work is to lay bare the bed-rock of syenitic gneiss that underlies the whole valley, at a depth of about 90 feet below the river-bed, the width of the trench corresponding with the base of the dam. Two smaller trenches will be made, each 10 feet wide and as many deep, running lengthwise of the dam, and, after all natural fissures in the bed-rock have been filled with hydraulic cement, the trenches will be built in with Cyclopean rubble, as it is termed—namely, large, rough, irregular blocks of stone, laid so as to break joints and filled in with cement, so that the mass becomes as solid as natural rock. All unevenness will be used to anchor the dam beyond the possibility of slipping. Gates and weirs of the best construction will be provided to carry off any overflow during exceptionally wet seasons, and the whole mass of water can be drawn off in case of necessity.

The estimates for the actual cost of construction are \$3,000,000, and the contracts contemplate its completion in 1891.

Floating Dock.—An off-shore floating dock for Cardiff, Wales, was constructed at Gray's, near Tilbury, and towed to Cardiff in June. In end elevation the structure resembles the letter L, the horizontal limb, which is in fact the pontoon, being wider than the vertical limb is high. The upright part of the dock is attached to vertical columns on shore by means of booms arranged in pairs, so as to insure parallel motion with the rising or sinking of the dock.

The pontoon, being filled with water, sinks to the desired depth, and the vessel is floated over it with obvious ease, since it can be warped into position broadside on. The keel-blocks and bilge-blocks are all worked by machinery from the top deck, as in all the best modern docks. The pontoon can be held at a level or given an inclination, if a vessel with a considerable list has to be taken up.

Maritime Engineering.—Among the great feats of launching should be noted that of an enormous lumber-raft at Joggins, Nova Scotia. The construction was begun in 1885, the design being to tow the completed raft to New York, and thereby save expense, and at the same time bring to market larger logs than can be handled on ordinary coasting-vessels. The

Side.

Cross Section on the Struts.

THE GREAT RAFT.

first attempt failed, the ways breaking down under the enormous weight; but the designer,

H. R. Robinson, of Nova Scotia, made a second attempt, which proved successful, in November, 1887. The raft was 560 feet long, 50 feet wide, 85 feet deep, and cigar-shaped, as shown in the engraving. A heavy chain-cable ran longitudinally from end to end at the center of the mass, and to this flexible backbone were attached other chains at intervals of ten feet, binding the whole together in a solid, yet more or less elastic mass. Other chains were tightened around the outside, and the swelling of the logs when immersed was counted upon still further to stiffen the whole. No fewer than 25,000 logs were thus lashed together upon launching-ways constructed with the greatest possible strength. In weight the raft largely exceeded any vessel that has ever been launched, and in size nearly equaled the Great Eastern. Its successful management on the ways is certainly a very creditable feat of engineering. The subsequent fate of the raft was not encouraging for a repetition of the experiment. The voyage was undertaken in December, and in tow of an ocean-steamer the raft was towed through several gales and reached a point near Nantucket shoals, when a gale of such violence was encountered that the cables parted and the steamer abandoned her charge. The United States Government at once dispatched vessels to remove such a danger to navigation, and in a few days it was ascertained that the raft had broken up, covering the sea for miles with its fragments.

Under this heading should be mentioned the launching of the *Trafalgar* (12,000 tons displacement), the largest iron-clad afloat, and the successful raising of the steamers *Welles City* and *Locksley Hall*, the first of which was sunk in the Hudson river opposite New York city, and the other in the river Mersey at Liverpool. In both cases wire cables were passed under the sunken vessels, and the rise and fall of the tide utilized in raising them to the surface, so that they could be towed into shoal water for repairs.

Railways.—A few years ago conservative travelers denounced the railway to the summit of Mount Washington as a desecration of nature, and were fond of saying that such outrages would not be permitted in Europe. Since then similar railways have been constructed on Mount Rigi and Mount Pilatus in Switzerland, the last named having been completed within the year. It overcomes steeper grades than any other road of its kind, and such is the rugged character of the mountain that excessive precautions had to be taken to guard against the creeping downward of the rails. The steepest grade of this road is 480 in 1,000. Among the difficulties to be overcome was the provision against expansion and contraction from changes of temperature, which are often abrupt, and in the course of twenty-four hours may cover many degrees.

In Russia some of the great government lines are laying double tracks, and the rails are

steadily pushing on toward the Asiatic frontier and across Siberia. German contractors have secured a large proportion of the Japanese railways now in course of construction.

In South America the daring schemes of engineers continue to receive encouragement, and the already elaborate system of railways through different regions is being farther extended. It is singular to find at this day that a tramway 200 miles long, with animals for motive power, is under construction in Buenos Ayres. The explanation is, of course, the expensiveness of machinery and the local cheapness of draught-animals.

Transportation by Rail.—The French Government, having recently met with some disasters in sending torpedo-boats from Toulon to Cherbourg by sea, decided to make the attempt to send them by rail. Trucks were constructed for the service. Each had three axles seven feet apart, the end axles having *Recour* bearings, which enable it to turn readily on a curve of 375 feet radius. The main platform consists of a frame secured to the truck by a main bolt and supported by spherical bearings which rest in guides. On each of the trucks is a large cradle or skid, shaped to correspond with the contour of the boat, and pivoted upon its bed. The two trucks are coupled closely together, forming as it were a single car, with the cradle-pivots about 27 feet apart. To lower the cradles as much as possible the supports are sunk between the wheels, the height of the vessel being, of course, limited by that of the bridges under which it is obliged to pass. The boat selected for the trial was 111 feet long, 11 feet wide, and 9 feet deep, and weighed, when stripped for the journey, 38 tons. Of course all the removable parts were detached before shipment. The line of the keel corresponded always with a line passing through the cradle-pivots, and considerable deflection had to be provided for, since the bow and stern projected, respectively, 44 feet and 38 feet in front and rear of the cradles. There was some danger that this overhang would cause too great a strain, as the iron plates were only three millimetres thick, but the journey of 847 miles was performed with no apparent injury.

The boat occupied the space of about five ordinary cars. The train was moved at a rate of about sixteen miles an hour, except for an experimental test, when the speed was increased to twenty-four miles an hour. It was demonstrated to the satisfaction of the engineers that a boat even larger than the one used could be transported from Toulon to Cherbourg in four days and three nights, and could be ready for service in twenty-four hours after its arrival. This exploit is, beyond doubt, the most considerable feat of ship-transportation by rail ever undertaken, and it goes far to demonstrate the practicability of such transportation, under more favorable conditions, of ships of far greater size.

In this connection may be noticed the shipment from the Krupp gun-foundry at Essen in Westphalia, to Antwerp, of an enormous gun destined for the Italian navy. In this case the inflexibility of the article to be transported simplified the problem, as weight alone had to be considered. This one item, however, was formidable enough. The gun is 45 feet long, 16 inches caliber, and weighs 118 tons. The special truck constructed for the trip weighed 98 tons. It was 75 feet long, and rested on 82 wheels. The trucks were adjusted so that at six different points deflections could take place for passing curves, without disturbing the adjustment-level of the main platform. The transit was effected without accident and the gun transferred to shipboard at Antwerp. It has since reached its destination at Spezzia. It is worth mentioning that this gun has been two years in making, and two others still larger are at present in the works at Essen.

Wells, Artesian.—The great artesian belt, as it is called, in Kern and Tulare counties, California, contains hundreds of flowing wells, and the importance of economizing the water for purposes of irrigation has led to the adoption of various devices, of which storage reservoirs are the simplest and, when all the circumstances favor, are perhaps cheapest and best. Some of the wells deliver 2,500,000 gallons of water every day, and, taking the whole artesian belt, it is probable that 100,000,000 gallons of water run daily to waste. If it found its way promptly into natural water-courses this would not be particularly objectionable, but the conformation of the country is such that it often stays where it is not wanted and rarely goes of its own accord where it is wanted. There is a State law requiring such wells to be capped when not in actual use, but it has heretofore been a dead letter. The nuisance of waste water threatens now to become so serious that the best systems of capping are of prime importance. The illustration shows the cap that controls a large well recently sunk for the Miramonte Colony in Kern County. A is an 8-inch elbow of cast-iron; B is a water-cap or gate of the same diameter; C is the gate-flange; D is a 10-inch casing; E is the small connection and pipe; F is the anchor of concrete; G, the cast-iron flange; H, the 8-inch casing, and I, the sand and cement between the casings. In beginning the work, the 10-inch water-tight casing of galvanized iron was put down forty feet. To the outside of the casing, nine feet below the surface of the ground, was riveted a cast-iron collar and flange, on top of which cement was poured, forming a roughly-circular block, four feet in diameter and a foot thick. When this "set," the earth was filled in above it, and it formed a very secure bar against upward movement. At the upper end of the 10-inch casing is a flange and collar with a water-valve gate, and above it a cast-iron elbow to divert the water. Everything being in place, the well proper was started in-

side the 10-inch casing, well-pieces, 8 inches in diameter, being sunk in the usual manner, and the space between the 8-inch and 10-inch

CAP FOR ARTESIAN WELL.

casings filled with sand and cement. The small opening in the side of the casings is intended to connect with a 8-inch pipe to lead the water to houses, barns, etc. When the cap is closed there is, of course, a heavy pressure in the well and all its connections, but it has thus far shown no signs of weakness. The multiplication of artesian wells renders their successful management a matter of considerable moment. Another remarkable well of this character is that recently bored for the new Ponce de Leon Hotel at St. Augustine, Fla. It is 12 inches in diameter, 1,400 feet deep, and flows with a constant volume estimated at 10,000,000 gallons of excellent water daily. It issues from the pipe with sufficient force to rise about 20 feet perpendicularly. The mouth of the well is ten feet above tide-water. The geological formations pierced were sand, small shells, and blue-clay rock, while at a depth of 450 feet a good supply of water was struck. At a depth of 520 feet a large accession of water occurred, and again after, at a depth of 1,100 feet, passing through coral and limestone. The drilling was continued through sandstone and limestone to 1,400 feet, but no advantage was gained thereby. The temperature steadily rose as the depth increased, and reached 86° at the bottom of the boring. Only two months were occupied in the work, the strata being generally easy to penetrate. American engineers have been very successful in sinking artesian wells, but much time and money are annually wasted in ill-advised attempts to sink wells where there is no reason for suspecting the existence of a water

supply. The Athletic Club of New York city recently sunk a well under their house and obtained a fine yield of water, but, hoping for still better results, the drill was pushed still farther, when the "bottom dropped out," and the water all went down instead of upward. Such failures must occasionally happen, since at best the location of a well is a matter of uncertainty.

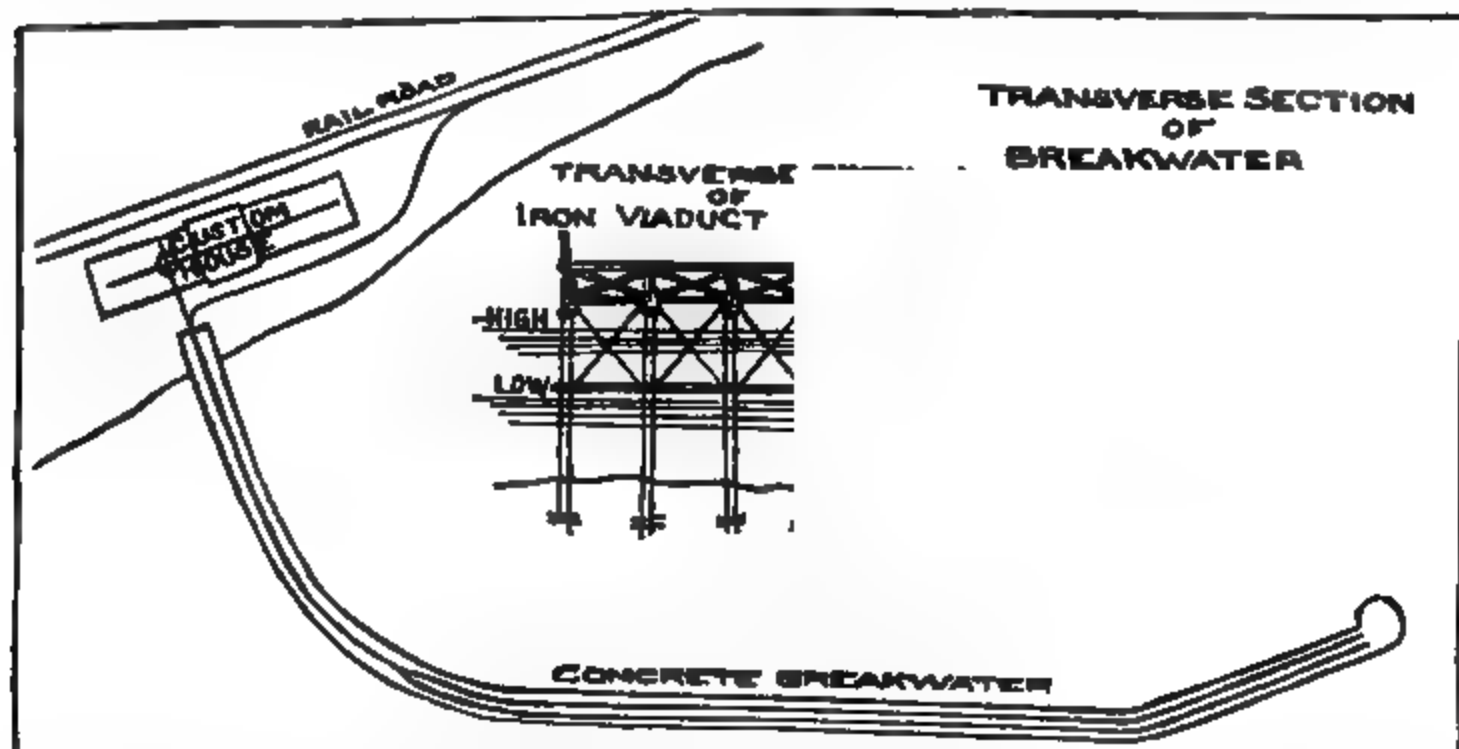

Harbor Improvement.—The port of Ceará, capital of the Brazilian province of the same name,

dragging their anchors and going ashore. The breakwater is placed so as to afford shelter from the prevailing winds, and is of simple construction. The principal quay is of solid concrete, and is connected with the shore by a viaduct of iron and steel 750 feet long. A railway runs the entire length of the structure, alongside of which vessels drawing 19 feet of water can lie even at low tide, the rise and fall being 6 feet. The works are constructed under an imperial concession from the emperor

HARBOR OF CEARÁ, BRAZIL.

has long been one of the principal South American ports at which foreign steamers call, and with which a considerable commerce has sprung up within the last generation. Prior to the erection of the works illustrated herewith, the port hardly deserved the name, since

of Brazil, and it is estimated that the income from port-dues will amount to at least \$100,000 per annum. The fine granite used in the construction of the work and of the adjoining custom-house buildings is quarried about sixteen miles from the port, and brought by rail

PLAN OF THE CEARÁ BREAKWATER.

the only anchorage was an open roadstead, and all goods and passengers had to pass between ship and shore by means of small boats or lighters. The situation was very dangerous for vessels receiving or discharging cargo, and it was often necessary for large vessels to run out to sea in order to escape the danger of

direct to the works. Railroads already existing afford communication with an inland region rich in all the staples of South American commerce. The engineers in charge are Messrs. R. E. Wilson and R. T. H. Saunders, both of England, and the work is done by a firm of English contractors.

EVANGELICAL ALLIANCE. The American branch of the Evangelical Alliance in March issued an appeal to the public in behalf of a closer and more intelligent co-operation on the part of Christians for defense against the many and great perils with which American institutions and Christian civilization seem to be threatened. Such co-operation, it was believed, would strengthen every denomination and greatly increase the effectiveness of each. Many prominent men of different denominations had expressed the belief that the Evangelical Alliance of the United States was a medium through which the desired co-operation could be naturally sought and easily effected. The alliance therefore would labor to promote this object, by the organization of branch alliances, which, being formed so far as practicable in every community, would afford opportunities for meeting and discussing the situation, and devising plans for the co-operation of the churches; by holding annually great conventions, the discussions of which would be put in print for general distribution; and by making the National Alliance a bureau of information touching religious and reformatory work, in pursuance of which aim carefully prepared tracts, bearing upon different departments of the subject, would be issued at short intervals. In accordance with the motives of this appeal, a National Christian Conference was called by the Alliance, and was held in the city of Washington, December 7, 8 and 9, for the discussion of the following questions: "What are the present perils and opportunities of the Christian Church and of the country?" "Can any of them be met best by a hearty co-operation of all Evangelical Christians, which, without detriment to any denominational interests, will serve the welfare of the whole Church?" "What are the best means to secure such co-operation and to awaken the whole Church to its responsibility?" Mr. William E. Dodge, President of the Evangelical Alliance, made an opening address, in which he dwelt upon the necessity of bringing the truths of Christianity to bear upon the social and economical questions of the day, and insisted upon their power, with the forces which they had in reserve, to meet the perils of the time, and find a solution for its perplexing problems. The several meetings on successive days were presided over in turn by the Hon. John Jay, Mr. Justice Strong, of the United States Supreme Court; Senator Colquitt, of Georgia; Mr. Justice Harlan; President Angell, of the University of Michigan; and Senator Hawley, of Connecticut. Subjects pertaining to the objects of the Conference were discussed in stated papers and addresses, as follows: "The City as a Peril," Rev. Daniel Dorchester, D. D., Rev. S. J. McPherson, D. D., and Rev. Mr. Loomis, of Brooklyn, N. Y.; "Immigration," Professor Hjalmar H. Boyesen, Rev. S. L. Baldwin, and Rev. J. M. Foster; "The Misuse of

Wealth," President Gates, of Rutgers College, and Rev. Robert O. Matlack; "Estrangement from the Church," Bishop J. M. Hurst and Rev. Arthur T. Pierson; "Ultramontaniam," Bishop A. C. Ooxe; "Jesuitism," Rev. J. M. King, D. D.; "The Saloon," Rev. R. S. McArthur, D. D., Rev. A. G. Haygood, D. D.; "Perils to the Family," Rev. S. W. Dike; "The Social Vice," Col. J. L. Greene, Rev. J. O. Thomas, D. D., Prof. S. E. Baldwin; "Illiteracy," Gen. John Eaton and Mr. N. M. Butler; "The Relation of the Church to Capital and Labor," Rev. James McCosh, D. D., Hon. Seth Low, and others; "The Christian Resources of our Country," Rev. J. M. King, D. D.; "Influence of the Universities on the Religious Character of the Nation," President Gilman, of Johns Hopkins University; "The Christian Resources of the South," Rev. N. E. Hatcher, D. D.; "Co-operation of Churches in Christian Work," Bishop Samuel Harris, Rev. Washington Gladden, D. D., and Prof. George E. Post, of Beyrout, Syria; "Methods of Co-operation among Christian Denominations," Rev. Josiah Strong, D. D.; "Methods of Co-operation in Large Cities," Rev. A. F. Schauffler, D. D., with discussion of the general subject of "Christian Co-operation," by other speakers; and "Individual Duty, growing out of Perils and Opportunities," Rev. A. J. Gordon, D. D.

EVANGELICAL ASSOCIATION. The following is a summary of the statistical report of the Evangelical Association, which was made to the General Conference at its meeting in September: Number of itinerant preachers, 1,123; of local preachers, 684; of members, 188,668; of Sunday-schools, 2,348, with 27,210 officers and teachers, and 162,887 pupils; number of churches, 1,886, the value of which was estimated at \$4,286,948; number of parsonages, 572, having a probable value of \$635,589. The returns show an increase in four years of 18,487 members, or 15½ per cent., while the increase during the preceding four years (1879 to 1883) amounted to 9½ per cent. The value of church property had increased during the past four years 18½ per cent., and the Sunday-schools showed an increase of 20 per cent.

The Charitable Society had a capital fund of \$24,822, had received an income during the past four years of \$5,948, and had expended, during the same time, \$5,852. Its capital had increased \$1,048 since 1883. The Ebenezer Orphan Home returned a realized endowment fund of \$153,375. Its receipts and expenditures for the year were balanced at \$11,920. The Publication House returned the value of its assets at \$498,483, and reported a gross profit in four years of \$181,749; the net increase in the value of its assets during the same time was \$51,681.

The total receipts of the Missionary Society for the year had been \$189,448. Of the expenditures, \$12,144 had been on account of the "European," and \$9,883 of the "heathen," treasury. The total receipts for the past four

years had been \$496,613, and the total expenditures \$520,851. The indebtedness of the society had increased in four years \$19,710, and was now \$40,819. The society possessed funds and real estate to the value of \$112,846. It sustained 542 missions, which were served by 552 missionaries, and returned 45,581 members, with 9,904 officers and teachers, and 63,783 pupils in Sunday-schools. The conferences in Germany and Switzerland reported a joint net increase of 400 members. The mission in Japan returned 8 itinerant preachers, 2 local preachers, 4 churches with 150 members, 7 Sunday-schools with 88 officers and teachers, and an average attendance of 280 pupils, and 18 baptisms during the year. The Woman's Missionary Society was sustained by 77 auxiliaries, with 2,012 members, and had received during the year \$1,825.

The General Conference met in Buffalo, N. Y., September 1. The bishops in their quadrennial address reviewed the condition and growth of the church during the past four years, showing increase in every department, particularly in the building of churches, which, with a few local exceptions, had involved no additional debts, and progress in the cause of higher education. The business transacted related chiefly to the special interests of the funds and benevolent enterprises of the church, and to cases of discipline. A motion to permit an extension of the time during which a preacher may remain on a single charge was disapproved. Resolutions passed by the preceding General Conference respecting changes in certain of the articles of faith were rescinded. Regulations were adopted for procuring more exact statistical returns of the denomination. They include provisions for the appointment of a statistical secretary by each annual conference, and a general statistical secretary by the General Conference, and directions to the ministers, regularly and properly to fill out the statistical blanks, and deliver them to the statistical secretary of their conference. The blanks include tables of membership, property, collections, Sunday-schools, and periodicals, and of financial returns. The sense of the Conference was expressed as in favor of more stringent sanctions of marriage, and ministers were advised "not to marry persons who, in consequence of the existing laxity of the divorce laws of the different States, have been divorced." The formation of a stock company in the Germany Conference for improving the security of the church property was approved.

EVENTS OF 1887. A glance at the following list of the events of the year presents in strong contrast the divided interests of Europe and the comparative harmony of the Western Continent. Riot and bloodshed have marked the history of the "Jubilee" year for Great Britain, and she, perhaps, has less to fear from violence than any of the Continental nations. Repeated attempts to assassinate the Emperor of Russia, almost ceaseless mutterings of war,

and political complications that threaten revolution, have been the lot of nearly all the great powers. In this country our only serious foreign complication has been with Canada, whose interests are after all practically identical with ours. Our elections have been free from undue excitement, and anarchy has received a severe though somewhat tardy lesson. The year's disasters will be found under the appropriate head, and details, as of elections and other important local occurrences, will in general be found in the special articles on the different States and countries.

January 1. The Emperor of Germany celebrated the eightieth anniversary of his entrance into the German army.

8. Stephen H. Mayham appointed Judge of the Supreme Court.

4. The Fitchburg Railroad bought the Hoosac Tunnel for \$10,000,000.

6. Pension bill appropriating \$76,247,500 passed by the House of Representatives; P. C. Lounsbury (Republican) elected Governor of Connecticut by the Legislature, there having been no choice by popular vote.

10. A new British Ministry appointed. (For details, see article on Great Britain.)

11. Congress passed a bill creating a Department of Agriculture and Labor.

12. William M. Stewart elected United States Senator from Nevada.

14. German Reichstag dissolved on the passage of an amendment to Prince Bismarck's army bill, limiting its duration to three years.

17. Dependent pension bill passed by house (179 to 76); pension bill, appropriating \$75,000,000, passed by the Senate.

20. Electoral count bill passed by Senate, having already passed the House.

21. Passage by Congress of the interstate commerce bill.

24. Bill authorizing the President to protect the rights of American fishermen passed by Senate (46 to 1).

27. Dependent pension bill passed by Senate; House rejects resolution to have United States Senators elected by popular vote; the harbor appropriation bill passed the Senate. British Parliament opened by the Queen.

28. Bill appropriating \$400,000 for State militia passed the Senate.

29. Post-Office appropriation bill passed the House.

31. Agricultural appropriation bill passed the Senate.

February 4. Congress reassembled after the holiday recess, but adjourned at once out of respect to the memory of General John A. Logan; the President signed the interstate commerce bill.

6. Stanley, the African explorer, set out from Zanzibar in command of an expedition for the rescue of Emin Bey.

7. Appropriation for armament and coast defenses (\$21,000,000) passed the Senate; Chinese Indemnity bill (\$147,750) passed the House.

8. Italian Ministry resigned because of their doubtful position in the Parliament.

10. Chinese indemnity bill passed the Senate.

11. Mr. Parnell's amendment to the reply to the Queen's speech rejected (352 to 246). Dependent pensions bill vetoed by the President.

12. Post-Office appropriation bill passed the Senate; bill to redeem and recoin the trade-dollar passed the Senate.

14. Daniel Manning resigned the secretaryship of the Treasury.

15. In honor of Queen Victoria's Jubilee, 25,000

prisoners were released in India. Municipal election in Philadelphia results in a Republican victory by 23,000 plurality.

16. Bill to increase the naval establishment (\$22,000,000) passed the Senate. Woman suffrage in municipal elections, went into effect in Kansas.

21. Election for German Reichstag resulting as follows: Conservative, 81; Imperialist, 89; National Liberal, 100; Center, 97; New German Liberal, 34; Polish, 15; Protester, 15; Socialist, 11; Guelph, 4.

22. Election in Canada resulting in the choice of 113 Ministerialists, 95 Opposition, 8 doubtful. Senator Ingalls elected (*pro tem.*) to the presidency of the Senate, *vice* Sherman resigned.

23. Retaliation bill regarding the fisheries dispute passed the House (252 to 1). Private pensions bill passed over the President's veto.

24. Veto of the dependent pensions bill sustained in the House (175 to 123).

25 and 26. Prolonged engagement between the Italians and Abyssinians near Massowah; Italians defeated.

26. Consular, diplomatic, and agricultural appropriation bills passed the Senate (\$1,429,942.14).

March 1. Fisheries retaliatory bill as proposed in the Senate agreed to by the House; legislative and deficiency appropriation bills passed the House. Mr. Farnell twice defeated in the British House of Commons on motions relative to the *clôture*.

2. Naval appropriation passed by Senate (\$25,753,165.44).

3. Opening of the new German Reichstag (see February 21). Legislative appropriation bill passed by the Senate (\$20,701,221.67); Mexican pensions bill passed by the Senate (\$6,000,000.96).

4. Sunday civil appropriation bill passed by the Senate (\$22,862,490); end of the Forty-ninth Congress; both Houses adjourned.

11. The seven years' army bill passed the Reichstag (237 to 31).

12. Schooner yachts Coronet and Dauntless sailed from New York for an ocean race to Queenstown.

13. An unsuccessful attempt made to assassinate the Czar of Russia; many arrests.

19. Bill for the redemption of trade-dollars passed both Houses.

21. River and harbor appropriation bill passed the Senate.

22. Interstate Commerce Commission appointed by the President. Ninetieth birthday anniversary of the Emperor of Germany.

24. Oscar S. Straus, of New York, appointed Minister to Austria.

27. Schooner yacht Coronet reached Queenstown.

28. Mr. Balfour moved the Irish crimes bill in the House of Commons.

31. The President made an allotment of land to the Warm Spring Indians under the new law; Charles S. Fairchild appointed Secretary of the Treasury *vice* Manning, resigned.

April 1. The Irish Crimes bill passed its first reading by application of *clôture* (361 to 253).

4. In Michigan a Constitutional amendment prohibiting the sale of liquor was defeated by about 5,000 majority.

6. John W. Davis, Democrat, elected Governor of Rhode Island.

12. The Governor of New York vetoed the Crosby high license bill.

13. Opening of the Dominion Parliament.

14. The body of Abraham Lincoln removed to its final resting-place at Springfield, Ill.

16. Gen. Alexander E. Lawton appointed Minister to Austria-Hungary.

18. The Irish crimes bill passed its second reading in Parliament of Great Britain.

20. The Queen of Hawaii and suite arrived in San Francisco.

21. A French official, Schnaebeles by name, was arrested as a spy by German police near Pagny-sur-

Moselle, and much excitement followed, but a peaceful solution was at last reached.

26. Resolutions against the Irish coercion bill were passed in the Canadian Parliament. Monument to John C. Calhoun unveiled at Charleston, S. C.

27. The ecclesiastical bill passed the Prussian House (243 to 100).

29. The British House of Commons declined to substitute the word "crime" for "offense" in the coercion bill.

30. Commissary Schnaebeles released by the Germans.

May 1. Convention announced between England and Turkey looking to the evacuation of Egypt in 1890. Turkey cedes to England the island of Cyprus.

11. James W. Hyatt, of Connecticut, appointed Treasurer of the United States *vice* Conrad N. Jordan, resigned.

12. Monument to James A. Garfield unveiled in Washington. Annexation of Zululand by Great Britain. French crown-jewels sold.

17. The French ministry resigned on the rejection of its financial scheme by the Chamber of Deputies.

19. Samuel Pasco chosen United States Senator from Florida.

June 14. A bill granting a temporary extension of the franchise on a property qualification passed by the Dutch Parliament.

21. Jubilee celebration in honor of the fiftieth anniversary of Victoria's accession to the throne of Great Britain.

27. British House of Commons passed the Irish crimes bill (349 to 282). The French Chamber of Deputies rejects a measure providing for the election of Senators by universal vote. Cutter-yacht Genesta won the Jubilee yacht-race around Great Britain.

29. Jacob Sharp convicted of bribing the Board of Aldermen of New York city.

30. Bloodless revolution in Hawaii. The King forced to grant concessions demanded by citizens of Honolulu.

July 1. Yale won the University boat-race.

3. Meeting of veterans on the battle-field of Gettysburg.

4. Equestrian statue of Gen. Ambrose E. Burnside dedicated at Providence, R. I.

7. Mormon convention at Utah adopted a constitution for a proposed new State, separating Church and State, and forbidding polygamy. Prince Ferdinand, of Saxe-Coburg-Gotha, elected Prince of Bulgaria by the Sobranje. British House of Lords abolished primogeniture in cases of intestacy.

9. Rev. Dr. Edward McGlynn excommunicated by Archbishop Corrigan.

14. Jacob Sharp found guilty of bribing New York Board of Aldermen; sentenced to four years' imprisonment and \$5,000 fine.

19. Queen Victoria assented to the Irish crimes bill.

23. Review of the British Navy off Spithead in honor of Queen Victoria's Jubilee.

During the month elections in Hungary resulted in the choice of 224 Liberals, 59 Independents, and 88 Moderate Oppositionists; Otto, King of Bavaria, was officially declared insane; and a bill was passed by the Belgian Chamber of Deputies exempting, with limitations, the pay of clerks and laborers from legal process.

August 1. Election in Kentucky; Gen. S. B. Buckner (Democrat) chosen Governor by 17,000 plurality.

2. An unsuccessful attempt was made to assassinate the Czar of Russia.

4. Election in Texas: vote on Prohibitionist constitutional amendment, 127,273 for, and 221,627 against.

5. Land bill passed to a third reading in the British House of Commons. Conviction in Chicago of eleven city officials for receiving bribes.

9. Fight in Colorado between Ute Indians and State troops; 4 Indians killed. Celebration at Monmouth, England, of the five hundredth anniversary of the birth of Henry V.

14. Prince Ferdinand, of Saxe-Coburg-Gotha, installed ruler of Bulgaria; the ministry resigned at once, and the Sobranje was dissolved.

15. Contracts for new United States cruisers and gun-boats awarded by the Secretary of the Navy.

19. Proclamation of the Irish National League announced in the British House of Lords.

25. Mr. Gladstone, in the British House of Commons, moved an address to the Queen, asking the withdrawal of the proclamation; motion lost by 272 to 194.

September 1. Annual meeting of the American Library Association at Round Island, N. Y.

2. New Bulgarian Cabinet announced, with M. Stambuloff as Prime Minister.

2-6. Annual encampment of the Grand Army of the Republic at St. Louis, Mo.

4. Meeting of the Irish National League at Ennis, Ireland, in defiance of the Queen's proclamation.

5. Labor Day, a holiday legalized by the State of New York, and now observed for the first time. The 9th International Medical Congress met in Washington; more than 4,000 physicians in attendance.

15-17. Celebration in Philadelphia of the framing of the United States Constitution.

16. British Parliament prorogued. Mexican Congress opened by President Diaz.

19. Parliament of Holland opened by King William.

21. Launch of the Trafalgar at Portsmouth, England. She is the largest iron-clad ever constructed.

24. William O'Brien, the Irish agitator, found guilty of seditious language and sentenced to three months' imprisonment. A party of French sportsmen fired upon by German guards near the frontier at Raon-sur-Plaine, 1 killed, 1 wounded; much international excitement followed but an amicable arrangement was finally reached.

25. Encounter between the police and the people at Mitchelstown, Ireland.

27-30. International yacht-race between British cutter *Thistle* and American sloop *Volunteer*; won by *Volunteer*.

28. The Jubilee receptions of the Pope began at Rome, Italy.

29. The Hungarian Parliament opened. Election in Tennessee; constitutional amendment in favor of prohibition defeated by 27,693 majority.

October 1. Official scandal in French army circles concerning the alleged sale of decorations; Generals Boulanger and Caffarel involved and placed under arrest.

3. General convention of Knights of Labor at Minneapolis.

9. Elections in Bulgaria; 258 supporters of the Government were elected against 27 Oppositionists.

14-17. Riotous demonstrations in London on the part of the homeless poor.

18. Bronze statue of Gen. George Gordon Meade un-

veiled in Fairmount Park, Philadelphia. Shakespeare Memorial, presented by George W. Childs of Philadelphia, dedicated at Stratford-upon-Avon, England.

27. Corner-stone of the monument to Gen. R. E. Lee laid at Richmond, Va.

29. Statue of Lief Erikson, the Norse explorer, unveiled at Boston, Mass.

November 8. Elections were held in eleven of the United States (details will be found in the special articles on those States).

12. Four convicted anarchists and rioters hanged in Chicago (the sentences of two others were commuted to imprisonment and another committed suicide in his cell).

16. Bronze statue unveiled at Lexington, Ky., in memory of John C. Breckenridge.

17. John Most, anarchist, arrested for uttering incendiary language.

18. Centennial Anniversary of the Methodist Episcopal Church, held in Brooklyn, N. Y. The Czar and Czarina of Russia made a state visit to Berlin.

24. Yale won the college championship at football, defeating Harvard by a score of 17 to 8.

27. Riotous demonstrations at Limerick, Ireland, on the occasion of a mass meeting to honor the memory of Irish patriots.

29. The Court of Appeals of the State of New York reversed judgment of the lower court in the conviction of Jacob Sharp for bribing the Board of Aldermen of New York city.

December 1. Jacob Sharp released on bail to the amount of \$40,000.

2. President Grévy, of France, resigned his office amid great excitement.

3. Marie François Sadi-Carnot chosen President of the French Republic.

5. The Fiftieth Congress of the United States met and organized.

6. The President's message was read to Congress.

7-10. General Conferences of Evangelical Christians in Washington.

8. John Most, the anarchist, sentenced to one year's confinement at hard labor in the penitentiary.

11. Attempted assassination of Jules Ferry in the hall of the Chamber of Deputies by a lunatic.

12. E. L. Harper, lately President of the Fidelity Bank of Cincinnati, sentenced to ten years in the penitentiary for misappropriation of bank funds.

15. National convention of Republican clubs in New York city.

20. Large lumber-raft abandoned at sea while towing from Nova Scotia to New York; raft subsequently broken up by the sea.

21. Steamship *Great Eastern* sold, to be broken up. Independence of Corea recognized by China.

31. The Pope celebrated the 50th anniversary of his ordination into the priesthood.

F

FINANCIAL REVIEW OF 1887. This year was one of peace and prosperity. Although at intervals political affairs in Europe were in a state of extreme tension, no serious results followed, and the preparations which some of the Continental nations made during the year for offensive or defensive operations may, unless some accident should occur, prevent the collision which has so long been expected. In France the change in the Presidency from M. Grévy to M. Sadi-Carnot was attended with even less friction than sometimes results from a municipal election or a senatorial contest in this country. In Germany the efforts of the

nonagenarian Emperor and of his Prime Minister were devoted to the maintenance of peaceful relations with neighboring nations, while at the same time the military and financial strength of the Empire was materially augmented. Russia was restless and apparently continually on the alert for a pretext for war, but at the same time she carefully avoided entanglements with any of the great powers. England enjoyed a season of political repose, broken only by occasional disturbances among some of her Irish subjects.

The trade of European nations appears to have been prosperous, and the financial con-

dition of all, with the exception of Russia, shows an improvement.

In this country nothing of a disturbing character occurred; the laws were enforced, anarchical demonstrations were suppressed, and the growth of socialism was materially checked. The organization of the Knights of Labor was, at the close of the year, less formidable than it was at the beginning. Apparently, members of the association found that their leaders had, in too many instances, been governed more by a desire for personal gain than for the good of the order, and gradually the power of the executive officers lessened, and disintegration of the organization commenced. The most serious blow which the order received was in February, when members of a district association refused to quit work for the purpose of assisting in the strike of the longshoremen and coal-handlers. The rebellion quickly spread to other districts of the Knights, and then those who had by blind obedience to the demands of their leaders suffered privation, sought to return to their former employment only to find their places filled. The signal failure of this strike encouraged employers to resist unjust demands when made by their workmen, and the result was more peaceful if not harmonious relations between capital and labor. Manufacturing interests revived, and in almost all branches they were active and attended with profitable results. The workmen had steady employment at fair wages in place of the irregular labor from which they suffered during the greater part of the previous year, and, in view of this experience, doubtless the large majority of intelligent laborers decided at the first opportunity to abandon the organization which, while promising so much, resulted in so little real benefit.

That the year was a prosperous one for agriculturists is shown by the fact that our crop of wheat is valued at \$419,520,000; that of corn at \$917,280,000, and that of cotton at \$334,620,000, making a total of \$1,671,420,000. The production of anthracite coal is valued at not far from \$140,000,000. The construction of nearly 18,000 miles of railroad called for the distribution of about \$254,000,000 among the iron and steel manufacturers, land-owners, and men who were employed upon the work. The speculation in lands and town sites West and South brought fortunes to those who were in a position to benefit by the rise in values. The industrial development of the South was in some instances marvelous. Earnings of railroads in almost every section of the country were unprecedentedly great. Capitalists obtained satisfactory returns for the money they had to loan or had invested in banking or other enterprises. Commerce was generally in a flourishing condition, and, although mercantile failures were in excess of those for 1886, doubtless many resulted from the unprofitable operations of previous years.

The silver question, which was a source of

anxiety in 1886, had less of a disturbing influence, mainly because of the utilization of the coinage through the issue of silver certificates of small denominations, which, to a considerable extent, satisfied the want for currency, and therefore proved of great public convenience. The report of the Treasurer of the United States shows that during the fiscal year ending June 30, 1887, 27.3 per cent. of the receipts for customs at the port of New York consisted of United States notes, 59½ of gold certificates, and 12 of silver certificates. During the previous fiscal year the percentage of the latter was 18.1, and for the year ending June 30, 1885, it was 35.6 per cent. This is an indication that the withdrawal of small United States notes and the substitution of silver certificates of low denomination was a wise measure, resulting in keeping the latter in active circulation. With a view to prevent the embarrassment which may some time occur from the continued coinage of the standard dollar, the Secretary of the Treasury, in his report to Congress, suggested that the 214,000,000 silver dollars in the Treasury at the date of his report will more than suffice to redeem all the silver certificates that can be issued against all the dollars which will be coined for years to come under the present act, and he therefore advised that the law be so amended as to authorize the Secretary to issue certificates against the coining value of the bullion bought, and to coin only such number of dollars as he might deem expedient.

The constantly accumulating surplus in the Treasury was a source of great anxiety during the last half of the year, and the conviction that the Secretary was unable, without further authority of law, to distribute this surplus, induced bank-officers to pursue a very conservative course, fearing trouble should an emergency arise. The President and the Secretary promptly called the attention of Congress to the subject, and asked for early legislation, at the same time suggesting a remedy for the evil. Toward the close of the year some bankers feared that the action taken by Congress might compel the Secretary to withdraw from the depository banks a large proportion of the funds he had placed therein for the purpose of assisting in relieving the money market; but these fears were partially allayed when it was seen that the withdrawal could be gradually made, and that if the money should be taken for government disbursements it would pass from one bank to another like any other deposit, and thus remain in the channels of trade.

While legitimate business in almost all branches was good and generally profitable during the year, speculation was not attended with satisfactory results. The attempt to corner coffee and wheat in June met with a disastrous failure, and the subsequent manipulation of wheat at San Francisco seriously involved all the parties connected with it. Toward the close of the year there was a very decided rise in copper, caused by the operations

of a foreign syndicate who had obtained control of the product. Few, outside the cliques, made money in stocks, and the majority of the non-professional speculators were unfortunate in their ventures.

The following tabular survey of the economical conditions and results of 1887 contrasted with those of the preceding year, is from official returns, and also from the "Commercial and Financial Chronicle":

ECONOMICAL CONDITIONS AND RESULTS.	1886.	1887.
Coin and currency in the United States, November 1	\$1,586,271,000	\$1,678,009,950
Mercantile failures	114,644,119	167,560,944
Imports of merchandise	668,429,189	708,807,811
Exports of merchandise	718,404,021	715,820,956
Imports of gold and silver	58,592,046	61,661,918
Exports of gold and silver	68,889,198	86,789,414
Railroads constructed, miles	8,648	12,794
Gross earnings, 110 railroads	816,046,287	860,259,567
Wheat raised, bushels	457,000,000	454,000,000
Corn raised, bushels	1,663,000,000	1,456,000,000
Cotton raised, bales	6,412,000	6,650,000
Pig-iron produced, net tons	6,865,325	7,187,206
Anthracite coal produced, tons	82,186,862	84,641,017
Petroleum, barrels	26,048,645	21,570,000
Immigration	886,681	509,281

The prices of leading staples on or about Jan. 1, 1888, compared with prices at the same date in 1887 and 1886, were as follow:

	1886.	1887.	1888.
Cotton, middling uplands, per pound	91 87	84 88	10 1/2 82 1/2
Wool, American XX, per pound	\$18 00 @ \$18 50	\$20 00 @ \$21 00	\$21 00 @ \$21 50
Iron, American pig No. 1, per ton	\$24 00 @ \$25 00	\$27 00	\$28 00 @ \$28 00
Steel rails at mills	92 1/2 90 1/2	98 1/2 48 1/2	92 65
Wheat, No. 2 red winter, per bushel	50 1/2		
Corn, Western mixed No. 2, per bushel	\$10 00 @ \$10 25	\$12 50 @ \$12 75	\$15 50 @ \$16 00
Pork, mess, per barrel			

The Money Market.—The range for the year for money on call, represented by bankers' balances, was from 67 per cent., June 30, to 1 per cent., August 18. The highest rate was in part due to manipulation, but mainly to the disturbance resulting from the collapse of the wheat-corner at Chicago and the subsequent failure of the Fidelity National Bank at Cincinnati. The lowest rate simply reflected a temporary absence of demand toward the close of the day's business. During the first quarter of the year the range for bankers' balances was from 8 to 1 1/2 per cent., averaging about 4. For the next quarter the range was from 20 to 2 1/2 per cent., averaging 6. During the third quarter there was a range of from 67 to 1 per cent., the average falling from 10 to 5. Thereafter, for the remainder of the year, bankers' balances ranged from 10 to 2 per cent., averaging 4 1/2. Commercial paper of 60 to 90 days' date, and first class, was comparatively easy during the first quarter at from 4 1/2 to 6 per cent., and at this period time-loans on stock collateral, running from four to five months, gradually became in good request, borrowers anticipating active money and desiring to make early provision. This inquiry for time-loans was so urgent during the next six months that rates advanced from 4 to

6 per cent., and very little could be done in commercial paper; and late in September merchants were unable to obtain discounts except at high rates, and in some cases 9 and even 15 per cent. were paid for the accommodation. For the last quarter of the year the tendency was toward ease for commercial paper, and time-loans were renewed at 5 @ 6 per cent. for 80 days to four and five months, but chiefly by out-of-town institutions, our city banks, during the month of December, preferring to loan on call, thus keeping bankers' balances unusually low for the season. The Comptroller of the Currency, under the act of March 30, 1887, on the application of banks at Chicago and St. Louis, early in the year made those cities central reserve centers, requiring the banks to keep 25 per cent. of their reserve at home. This, to some extent, assisted in the withdrawal of balances held in New York to the credit of institutions in these new reserve cities, and the money thus sent to Chicago and St. Louis was retained. Speculation in farm-lands and real-estate mortgages, extensions of railroads in the Western country, and active business throughout that section and in the South, altogether contributed to drain the banks of New York of the balances owing to interior institutions, and fears that

the wild speculation in wheat and in other staples and in mortgages upon farms of uncertain value would some day suddenly collapse, induced our bankers to pursue a very conservative course, which, in many cases, resulted in injury to mercantile interests, especially in the city. The break in the wheat and coffee corners, June 14 and 15, and the disastrous results which followed seemed to justify bank-managers in continuing their conservative course, and appeals were made to the Secretary of the Treasury to relieve, by purchases of bonds, the monetary stringency which threatened all commercial interests. The Secretary had, up to and including May 20, called in \$63,612,250 3-per-cent. bonds for redemption, the last call on the above-named date being for \$19,717,500 on all the outstanding bonds of this issue, and this call matured July 1. After consideration of the urgent needs of the country, the Secretary, on August 4, directed that the interest due at various dates, to and including January 1, be paid with a rebate of 2 per cent. per annum, and also that 4 1/2-per-cent. bonds be purchased for the sinking-fund each week. After \$11,565,800 had been so bought up to September 21, the supply became so limited that further purchases could not be made with profit to the

Government. The money market had been only temporarily relieved by this policy of the Secretary, and therefore he decided, on September 22, to buy 4- as well as 4½-per-cent bonds to the extent of \$14,000,000, also for the sinking-fund, and to pay, without rebate, \$6,500,000 interest due October 1. Purchases of about \$18,000,000 of these bonds were made, thus completing the sinking-fund requirements for the current fiscal year. This resulted in a little easier feeling, and the market was further relieved by the increase, commencing in October, of the number of the depository banks throughout the country and the augmentation of the amount of public money which each bank was entitled to hold. As this increase in the deposits naturally called for United States bonds as security, no further purchases of them could be profitably made, even if the Secretary had authority of law therefor. Both the President and the Secretary of the Treasury called the attention of Congress, at the opening of the session in December, to the fact that the power of the department further to distribute the almost constantly-increasing surplus was exhausted, and prompt legislation asked for. Summing up the operations of the Treasury for the relief of the money market, we have \$63,612,250 3-percents. called in for redemption, of which \$62,877,150 were redeemed; \$11,565,300 4½-percents., and \$18,000,000 4-percents. bought for the sinking fund, and \$25,714,417 public money placed in the designated depositories since July 1. This makes \$112,656,867 distributed from the Treasury independent of interest payments. The net gold imports for the year to November 30th were \$84,806,111, which, added to the above, makes a total supply of \$146,962,978. Notwithstanding this, however,

the demand for customs and the drain to the interior kept the reserves of the banks comparatively low. The highest amount of surplus reported was \$22,298,450 on January 29, when the banks held an average of \$118,088,900 reserve, consisting of \$92,851,600 gold and \$25,187,800 legal tenders. The surplus gradually fell to \$3,845,900 by June 25, but the gold dropped to \$68,120,400 September 10, then recovered to \$78,816,600 by October 29, and again fell to \$68,146,800 December 8. The demand from the interior for legal tenders reduced the amount to \$18,989,500 by April 9. Then came an increase to \$24,889,200 by May 28, followed by a fall to \$20,328,800, October 1, and then there was a recovery to \$27,259,800 by the end of the year. The surplus then stood at \$8,559,150, against \$11,962,175, October 29. Discounts were \$370,917,500, April 9, the highest point of the year. Then came a fall to \$344,388,900 by September 3, and a recovery to \$356,540,000 by the close of December. Deposits were at the maximum \$392,771,200, February 12. The fall was gradual to \$341,935,900, September 24, and then came a recovery to \$358,768,400, November 4. Bank-clearings showed the highest daily average, \$134,794,859, January 9. The lowest average was \$84,251,288, August 20, and the highest after that date, \$129,654,229, November 19.

The Comptroller of the Currency reports the failure, during the year, of eight national banks, with an aggregate capital of \$1,550,000, and six of these failures resulted from mismanagement or embezzlements. The condition of the New York Clearing-House banks, the rates for money, exchange, and silver, and prices for United States bonds on or about Jan. 1, 1886-8, are shown in the following summary:

BANK RETURNS, ETC.	1886.	1887.	1888.
NEW YORK CITY BANKS:			
Loans and discounts.....	\$389,909,900	\$348,687,500	\$356,540,000
Specie.....	89,721,100	62,718,100	71,189,800
Circulation.....	9,979,500	7,911,500	8,077,800
Net deposits.....	376,950,900	359,295,000	359,859,800
Legal tenders.....	29,809,300	19,870,400	27,259,500
Required reserve.....	94,289,925	89,817,150	89,589,950
Reserve held.....	118,529,800	102,085,500	98,899,100
Surplus reserve.....	\$24,299,475	\$12,271,850	\$8,559,150

4s of 1907, coupon.....	123½	127½	126½

Appended is the New York Clearing-House statement of totals at the beginning of each quarter of 1887 and at the end of the year:

DATE.	Loans.	Specie.	Circulation.	Deposits.	Legal tenders.
January 8.....	\$349,473,900	\$25,808,300	\$7,496,400	\$370,188,900	\$21,812,900
March 26.....	365,408,000	79,602,700	7,647,900	374,702,200	20,259,700
June 25.....	363,484,400	72,380,700	8,294,100	369,154,400	22,108,800
September 24.....	346,429,400	70,621,900	8,297,900	341,935,900	20,778,400
December 31.....	356,540,000	71,189,800	8,077,800	359,859,800	27,259,800

Foreign Exchange.—Imports of merchandise for the year ending Dec. 31, 1887, were \$45,878,122 above those for the corresponding period in 1886, and the exports of domestic and foreign goods for the same time were \$1,916,985 more. The excess of merchandise exports over imports for the calendar year was \$6,513,645 against \$49,974,832 for the same time in 1886. There was an excess of imports over exports of specie and bullion amounting to \$24,872,499 for the year ending Dec. 31, 1887, against an excess of exports over imports of \$9,806,552 for the same time in 1886. The excess of imports over exports of merchandise and specie for the period mentioned was \$18,858,854, against an excess of exports over imports of \$59,781,884 for the corresponding twelve months of 1886. But, notwithstanding this adverse apparent trade balance, foreign exchange only at infrequent intervals during the year ruled at or near the gold-exporting point.

The banks of England and of France, whenever a drain of gold to America was either threatened or in actual progress, sought to avert or to limit such drain, either by manipulation of the discount market or by an advance in the premium upon gold bars or full-weight coins. At the beginning of the year the bullion in the Bank of England amounted to £19,307,281, and the proportion of reserve to liabilities was 30½ per cent. The largest amount of bullion held by the bank during the year was £24,770,532 on March 30, and with this sum the bank governors decided a fortnight later to reduce the minimum rate of discount to 2½ per cent., and by the close of April a further reduction was made to 2 per cent., the proportion of reserve to liabilities then being 50½ per cent. It was not until August 3 that the bank rate was raised, and then it was placed at 3, remaining at that point until the close of the month, when it was further advanced to 4 per cent., at which it stood at the end of the year. But at no time was the open market rate close to the bank minimum, with perhaps the exception of a few days early in the fall, and on two occasions the bank governors sought to sustain the street rate by borrowing for the bank upon consols. The Bank of France opened the year with the equivalent of £49,100,166 gold. This was reduced to £47,494,079 by April 14, and after this the amount fluctuated between this sum and £48,400,182. The gold in the Bank of Germany can not be accurately stated, but the closest estimate places it at about £18,000,000 January 1, advancing to £21,800,000 by June 28, then falling to £19,300,000 October 7, and rising to about £20,159,000 by the end of the year. London and Paris doubtless supplied a large part of Germany's requirements during 1887, and it is known that, while this movement to Germany was in progress, the centers above named were meeting demands for America and the Argentine Republic.

That condition of our foreign exchange

market, which enabled importations of gold to be made, was manifestly due neither to trade conditions nor to any plethora of gold in England or France, but mainly to the fact that the rates for money ruled in this country so much higher than they did in London as to induce bankers to employ their foreign balances in our market. These borrowings of foreign capital for temporary use were extended from time to time, as the loan bills matured, and it is estimated that they amounted to at least £5,000,000 sterling. In addition to this there were negotiations of loans upon bonds of new or reorganized roads, or borrowings of capital upon lines in process of reorganization, amounting to as much more; and there were also purchases at intervals of stocks or bonds or both for speculative purposes, which were more or less promptly drawn against. All these transactions furnished a supply of exchange which, while it was plentiful, stimulated imports of gold. Early in January there was a good demand for sterling to remit for stocks sold for European account, and there was also an inquiry for long bills for investment and for speculation. This strong tone carried exchange above the gold-importing point, and the limit at which imports could be made was increased by the Bank of England putting a premium upon bars, and the Bank of France holding full-weight Napoleons at an advance of one franc per 1,000. Toward the close of January the interruption to exports, caused by the strike of longshoremen in New York and vicinity, made commercial bills so scarce as to force rates of bankers' sterling to within a fraction of the gold-exporting point, and by the middle of February gold was shipped to England in moderate amounts. By the end of February the supply of bills increased, in consequence of the free movement of breadstuffs, the partial embargo on the commerce of the port having been raised by the collapse of the longshoremen's strike. Early in the following month liberal sales of short sterling, mainly maturing long bills, bought in January, started selling of commercial sterling, and the market was somewhat affected by activity in money. By the middle of March sales of loan bills had a depressing effect upon the rates of sterling, and then commenced the borrowings of foreign capital, which thereafter had such an important influence upon the market. At the beginning of April the discount rate for sixty-day to three-months' bills in London was 1½ per cent., and at Paris the open market rate was 2, and at Berlin 2½ per cent., while the call-loan rate in New York averaged about 6. This condition of the money markets induced buying of long bills and further borrowings of foreign capital were made later in the month. In May the tone was steadier, although money continued cheap in London and on the Continent, and comparatively dear here, but early in June sterling declined under the influence of offerings of bills against outgoing securities and ne-

gotiations of railroad loans, and by the middle of the month the fall in the price of wheat resulted in such free sales of commercial drafts that the market became very weak. Later, active money, due to the feverish condition of the stock market, the break in wheat and coffee, and the failure of the Fidelity Bank at Cincinnati, assisted in unsettling exchange, and in the last few days of the month sterling fell to points which justified gold imports, and about \$1,850,000 of the metal was ordered out from London. At the same time Germany drew gold from the British metropolis to assist in floating her new loan of 100,000,000 marks. In July the tone of exchange was heavy, but rates were fractionally above the gold-importing point. Early in August the Bank of England minimum rate of discount was advanced to 8 per cent., partly in consequence of a drain of gold to the Argentine Republic, but this only temporarily affected exchange, and by the middle of the month rates fell so as to justify a renewal of gold imports, the decline being assisted by the negotiation of a railroad loan, and the metal moved hither from London and the Continent in comparatively liberal amounts during the remainder of this month until the middle of September when a rise in sterling checked imports from London, but the movement from Paris was only partially interrupted, although the Bank of France advanced the premium on gold to 8 francs per 1,000, the highest point recorded in many years. Toward the close of the month a fall in sterling again started gold from London, but it was checked in October, and exchange was strong during this month in response to a demand to remit for stocks sold for European account and in settlement of borrowed capital which was then being returned. Thereafter during the remainder of the year commercial bills were scarce, bankers' sterling in limited supply, and the market gradually advanced so that at the end of December it stood midway between the gold importing and the exporting points.

Manufacturing Industries.—The labor troubles had less influence upon manufacturing enterprises in 1887 than they did in the previous year. The employers seemed to feel more confidence in their ability to resist unjust demands, and the various organizations of the Knights of Labor, probably profiting by the ill-success which attended their efforts in 1886, were less exacting in their requirements. The strike of the coal-handlers in January temporarily unsettled the market for coal, but it only partially checked the operations of the iron-works in Pennsylvania, and after the failure of the strike manufacturing of iron and steel increased, and, under the stimulus of a demand for railroad and structural purposes, the mills were kept at their full capacity for the greater part of the year. The production of these articles was the largest on record, exceeding that of 1886, and the output of pig-iron is estimated at 6,250,000 gross tons against 5,683,829 in the previous

year. The Bessemer steel-rail production was 1,950,000 tons against 1,574,703 in 1886. Iron-ore was produced to the extent of 11,000,000 gross tons. Prices for rails were maintained until after the middle of the year, when they yielded, partly in consequence of the competition of imported rails, but mainly because of the conviction that the phenomenal demand for new railroads could not continue. New iron-mines were developed, principally in the Gogebic region and in Alabama. The industrial growth of the South during the year was most remarkable, covering almost the entire range of manufacturing. Of the fourteen Southern States there were only four in which the capital invested in new enterprises was not double the amount of the previous year. Woolen-goods manufacturers, particularly at the North, probably made less money than they did in 1886, but they worked principally on orders, and, therefore, did not accumulate large stocks to be slaughtered in the auction-rooms. Producers of worsted goods, such as cloths and coatings, turned their attention to casimeres, chiefly because they could not compete with the foreign fabrics of the same class of material, and, in consequence of the change, they had a prosperous year. The manufacturers of knit-goods were full of orders during the whole of the twelvemonth, the consumption was marvelous, sales were prompt, and prices fair. In cotton and print goods the business of the mills was profitable, with some notable exceptions. New railroad mileage was about 12,724 miles, principally in Kansas, Texas, Nebraska, Michigan, Alabama, Colorado, Montana, Dakota, Georgia, and California. Coal production was vigorously pushed, the demand was good, and prices generally uniform. The total output for the year was 34,641,017 tons against 32,136,362 in 1886.

Railroads.—The most important event of the year affecting the railroad interests of the country was the passage by Congress of the interstate commerce act, which went into operation April 5. While the bill was under discussion, opinions were expressed by prominent railroad-managers that its rigid enforcement would prove injurious, if not disastrous to the transportation interests of the country, and the most objectionable feature of the law, in their estimation, was the fourth section declaring it to be unlawful for any common carrier, subject to the provisions of the act, to charge or receive any greater compensation, in the aggregate, for the transportation of passengers or of like kind of property, under substantially similar conditions, for a shorter than for a longer distance over the same line, in the same direction, the shorter being included within the longer distance. Immediately upon the measure taking effect the commissioners appointed under it, acting by authority of the law giving them the power, suspended, for ninety days, the operation of this section on the application of Southern and other roads

having competing water-routes or other competitive lines, and before the expiration of the ninety days the commissioners rendered a decision, in substance declaring that the carrier must for himself, and at his own risk, decide the question of his liability under the section. The only judicial decision on this point is the one rendered by Judge Deady, of the United States Circuit Court, sitting at Portland, Oregon, in which the rule was laid down that "freight carried to or from a competitive point is always carried under substantially dissimilar circumstances and conditions from that carried to or from non-competitive points. In the latter case the railway makes its own rates. In the former case the circumstances are altogether different. The power of a corporation to make its own rates is limited to the necessities of the situation. Competition controls the charge. It must take what it can get, or abandon the field and let its trade go to rust." This decision was regarded as practically nullifying the fourth section of the interstate law, and soon after its announcement the

Trunk. At the close of the year amendments to the interstate law were suggested, one of which was the imposition of a duty upon goods transported on Canadian roads from points in the United States to other points in this country, the object being to prevent competition by these lines. By the change in the management of the Baltimore and Ohio, through the retirement of its president, Mr. Garrett, the road was brought into harmony with the other main trunk-lines, thus insuring uniformity of rates. The successful reorganization of the Reading had an important influence upon the anthracite-coal trade, and the reorganization of the Central New Jersey, together with its alliance with the Lehigh Valley, tended to harmonize transportation interests between Philadelphia and New York, which had long been in conflict.

The following table shows gross and net earnings of the principal trunk-roads, the reports, except for the Pennsylvania, being made for fiscal years, and the returns of the New York Central including the operation of the West Shore leased line:

ROADS.	1881-'82.	1882-'83.	1883-'84.	1884-'85.	1885-'86.	1886-'87.
PENNSYLVANIA:						
Gross earnings	\$49,079,584	\$51,038,252	\$48,566,911	\$45,615,927	\$50,879,068	\$55,671,208
Net earnings	18,482,429	19,836,102	18,089,902	16,135,260	17,756,451	18,564,738
NEW YORK CENTRAL:						
Gross earnings	30,623,781	28,770,722	28,143,667	24,429,441	30,504,361	35,297,056
Net earnings	11,332,807	13,090,128	10,299,856	8,110,069	11,595,934	12,908,493
ERIE:						
Gross earnings	19,975,774	22,802,246	21,687,435	18,984,578	22,500,046	24,210,358
Net earnings	6,887,681	7,867,668	5,279,353	4,537,056	6,111,409	6,512,685
BALTIMORE AND OHIO:						
Gross earnings	18,883,875	19,789,587	19,484,607	16,616,642	18,422,488	20,659,086
Net earnings	7,454,682	8,705,823	7,760,300	5,642,057	6,896,695	6,588,905

transcontinental lines of road proceeded to take advantage of it, claiming that they were in competition with the Pacific Mail as a water-route. A few suits were brought during the year by shippers in various sections of the country, who claimed that this and other provisions of the law had been evaded or disregarded, but no judicial decision was reached, the cases not having been brought to trial. The main trunk-lines of the country were not unfavorably affected by the operation of the law, and only a comparatively few local roads suffered. Rates for freight and passengers were advanced by nearly all the lines on or after the passage of the law; the pooling-system was abandoned, this being prohibited by the act; free passes were generally abolished, and other reforms, permitted or required by the act, were instituted, and the result was shown in substantially increased earnings of nearly all the railroads of the country. After the winter-wheat crop was moved, the Granger roads began to cut rates, and this cutting was more or less vigorous at intervals during the latter part of the summer and in the fall. Early in the winter the Grand Trunk, of Canada, commenced a cut upon dressed-beef rates, which was met by the American trunk-lines, and the war was carried on so vigorously that it soon after ended by the abandonment of the contest by the Grand

The Crops.—The yield of wheat for the season of 1887 is reported by the Department of Agriculture as only about 1,000,000 bushels less than that for the previous year, while that of corn is nearly 210,000,000 bushels less. The estimates of cotton vary, but good authorities claim a crop of 6,650,000 bales against 6,513,620 for 1886. The spring-wheat area was enlarged west of the Mississippi and in the extreme Northwest and particularly in Dakota, where there was a gain in acreage of 24 per cent. The injury to winter wheat by thawing and freezing and the absence of snow was severe in Kansas, and moderate in Missouri, Illinois, Indiana, and in other sections of this belt. The harvest exhibited the results of insect ravages and want of uniformity in the weight of the grain. Drought and insects threatened serious deterioration of spring wheat early in the season, but more favorable conditions followed, and, on the whole, the result of the harvest was better than was expected, owing to the increase of acreage. The Department of Agriculture reports the yield about 456,000,000 bushels. After corn was planted there was an extraordinary development which gave promise of an abundant yield. A high condition was maintained through July, but in the following month and in September the drought was so severe that wide-spread ruin

seemed inevitable. Rain came, but too late to repair the damage. The severity of the reduction fell upon Kansas, Illinois, Indiana, and Ohio, and in other of the surplus-producing States. Large quantities of the green corn were cut for fodder in consequence of the destruction by drought of pastures, and therefore a close estimate of the yield of this cereal can not be made, but the Department of Agriculture calculates that the crop will not vary much from 1,456,000,000 bushels. The quality of oats is below the average, but the enlarged area planted will probably bring the crop up to about 659,000,000 bushels. The crop of barley is estimated at 55,000,000, that of rye at 24,000,000, potatoes at 184,000,000 bushels, and cotton at about 6,650,000 bales. At the International Seed and Grain Convention, held in Vienna early in December, the reports received indicated average crops of wheat in the principal exporting countries of the Continent, and a slight deficiency in India. The requirements of Great Britain and France would, it was estimated, be less than those of last year. The corner in wheat, which was the feature of our market in June, carried the price so high that it drew large supplies of the new crop of winter wheat from farmers' hands, and it is probable that all the available surplus was then thrown upon the market. After the collapse of the corner, about the middle of June, the export movement was stimulated, and spring wheat came from the producers rapidly immediately after the harvest. The visible supply of this cereal at the end of the year was about 44,000,000 bushels against a little over 62,000,000 at the close of 1886. Taking the prices in the New York market on or about the 1st of January in each year and the total yield for the previous season, we have the following approximate results in quantities and values:

THE CROPS.	Yield.	Price.	Value.
1886.			
Wheat, bushels	457,213,000	\$0 98½	\$428,641,875
Corn, bushels	1,665,441,000	48½	\$801,498,481
Cotton, bales	6,518,622	9½	\$600,738,974
1887.			
Wheat, bushels	456,000,000	92	419,520,000
Corn, bushels	1,456,000,000	68	917,280,000
Cotton, bales	6,650,000	10½	\$84,020,000

The Stock Market.—After an irregular movement in January the course of the stock market was generally upward until June, when a bear combination commenced operations, which were aided by the unsettled feeling resulting from the collapse of the corners in coffee and wheat, and the tendency was downward until early in the fall. Then came a recovery followed by another decline in October, after which the market reacted and gave promise of a decided improvement. Toward the close of the year, however, there was a feverish feeling due to various causes, and the tone was more or less unsettled to the end of the twelfth month. Comparing closing prices on the 30th of December with those at the opening on

January 8, thirty-three of the active stocks exhibited an average decline of 10 per cent. During the first few days of January, Central New Jersey, Reading, Western Union, and Richmond Terminal were pushed upward by the cliques, and this was the beginning of the movement for a control in the latter which resulted in the deal with the holders of East Tennessee, Virginia, and Georgia preferred stock. The rise in Central New Jersey was also due to purchases for control, as it subsequently appeared, by the Corbin party, who had in view the reorganization of the property on a dividend paying basis. Hocking Valley advanced in consequence of buying for the Vanderbilts, and Reading was favorably influenced by the advice of Mr. Gowen, to holders of junior securities, to accept the plan of reorganization. Raiding of Richmond Terminal followed the announcement of the intended issue of new stock, with which to pay for East Tennessee, Virginia, and Georgia preferred, and thereafter, for the remainder of the month, the bears succeeded in keeping the market in a more or less unsettled condition. The passage by the House of Representatives on the 20th of the interstate commerce bill, and its transmission to the President on the 25th, assisted the bearish demonstrations, and the partial embargo of the commerce of the port of New York through the strike of the longshoremen and coal-handlers also had an unfavorable influence on the market. Stocks were feverish and generally lower during the early part of February, but before the close there was a recovery, and sixty out of sixty-six more or less active properties exhibited a gain, comparing prices at the end with those at the beginning of the month. During the first week the London and Continental markets were unsettled in consequence of war rumors; the threatening attitude of the Knights of Labor on strike in this city excited some apprehensions, and reports that the President would sign the interstate bill were used by the bears to their advantage until the bill was signed on the 4th, and then there were indications that the event had been discounted. The strike of the longshoremen came to an end on the 11th through a refusal of other organizations to assist it by also quitting their employment; the European markets recovered on the subsidence of the war feeling; the Grangers advanced on favorable traffic reports; the coal-shares steadily improved on news that a strike on the Reading had been prevented, and the tendency of the whole market was upward, notwithstanding realizing sales and bearish pressure, for the remainder of the month. The tone was generally strong during March, and only five out of sixty-six stocks recorded declines. The favoring influences were the assurance of the success of the Reading reorganization scheme, as indicated by the prompt deposit of securities; the announcement that an extra session of Congress would be unneces-

sary, and the news that Mr. Robert Garrett had offered the sale of a controlling interest in the Baltimore and Ohio to a speculator who, it was supposed, would, if he were successful, use it to the advantage of the Richmond Terminal and the Western Union. During the second week the news that the publication of the Baltimore and Ohio scheme was premature started a free-selling movement in Richmond Terminal, Western Union, Central New Jersey, and Reading, which made the whole market unsettled until the last week in the month, when purchases of stocks for European account, manipulation by the bulls in the Grangers and Southwesterns, and a sharp advance in some of the so-called fancy stocks carried prices upward, and the market closed strong. On the 5th of April the interstate law went into effect, but the commissioners immediately suspended for ninety days the operation of the 4th section, relating to the long and short haul, so far as it affected Southern roads in competition with water-routes, and subsequently ordered a suspension on all roads of the country making application. As this section was regarded by the railroads as the most unjust feature of the measure, the action of the commissioners had a favorable effect on the market. One feature early in April was a rise in Central New Jersey on a report that the parties in control were negotiating for an alliance with the Lehigh Valley. The advance in this stock stimulated an improvement in Reading and subsequently in the other coal-shares. Later came good buying of the trunk-line properties, Manhattan Elevated, Richmond Terminal, Union Pacific, Western Union, and the Grangers, and the tendency of the market was generally upward to the close. In May only six of the sixty-six active stocks showed declines, comparing the opening with the close of the month, and some of the advances were important, especially those in the San Francisco's, Duluth, Manitoba, Pullman, and the Grangers. An attack upon New York and New England was one of the features early in the month, but the bulls seemed to combine to resist the assault and the market was advanced more or less rapidly during the next fortnight, the rise being assisted by favorable news, a manipulation of the short interest, and decided increases in railroad earnings, which were regarded as important in view of the fact that these, in some degree, reflected the operation of the interstate commerce law. Toward the close of the month raiding by the bears and realizing sales by many speculators, who had a profit on their holdings, made the market more or less unsettled, but the tone was generally better at the close. Early in June the indications pointed to a further rise in prices of leading stocks, but comparisons at the end of the month showed that, out of fifty-eight stocks, only four had advanced. Reading opened at a price representing the first installment of the assessment, and a few days thereafter the bears commenced to hammer it. The next stock at-

tacked was St. Paul on the news that the directors had decided upon an issue of 100,000 shares of additional stock. Then came on the 14th and the 16th the collapse of the bull movement in coffee and wheat, but after this there was a partial recovery. During the third week rumors of a disquieting character regarding the stability of banks in Chicago, Philadelphia, and Boston, resulting from the failure on the 20th of the Fidelity Bank at Cincinnati, assisted the bearish demonstrations, and then followed a fall of 41½ points in Manhattan Elevated on June 24, which made the market panicky. In the last week of the month Pacific Mail was broken down, money became active, and persistent attacks by the bears kept the market in a more or less feverish condition to near the close, when there was a sharp upward turn imparting a better feeling. One of the most important events in July was the decision of Judge Deady, sitting in United States Circuit at Portland, Oregon, in the case of the California and Oregon road, whose receiver asked for instructions as to what rates should be established in view of the competition of the water-routes between Portland and San Francisco. The court decided that the road might charge a greater price for a short than for a long haul because of this competition, and then laid down the broad principle that the interstate law was not intended to ruin railroad properties but to foster interstate communication. This was the first judicial decision under the law, and it was, to some extent, subsequently taken advantage of by the transcontinental roads in competition with the Pacific Mail. Another event was the failure of the so-called Baltimore and Ohio deal, the negotiations being declared by Mr. Garrett at an end, because of the inability of the parties proposing to purchase the property to meet their engagements. The course of the stock market was generally downward during July, it being subjected to frequent raids. Western Union was, in the early part of the month, feverishly strong in consequence of rumors of favorable progress toward a consummation of the Baltimore and Ohio deal, which it was expected would result in the transfer of the telegraph line to the Western Union, but on the 18th the announcement that the negotiations were off, and that Mr. Gould did not consider it advisable to buy the Baltimore and Ohio Telegraph property, had an unsettling effect, and one feature was a fall in Cincinnati, Hamilton, and Dayton stock, which was largely held as collateral for a loan to the parties negotiating with Mr. Garrett. The market was feverish during the last week in the month, when Western Union, New England, Richmond Terminal, Reading, St. Paul, and, indeed, nearly all the active stocks were, in turn, attacked, and comparisons of prices at the close with those at the opening of the month showed a fall in every stock on the list with the exception of Northern Pacific common, and the ad-

vance in this was only $\frac{1}{4}$ of 1 per cent. The market was unsettled during the greater part of August. The bear campaign temporarily culminated in the first week, the short contracts being partially covered, and an advance was encouraged on the 4th by the announcement that the Secretary of the Treasury would buy $4\frac{1}{2}$ -per-cent. bonds for the Sinking Fund, and would also anticipate interest for the purpose of relieving the stringency in the money market. During the next week the Northern Pacifics and the Grangers were freely sold, but there was a recovery toward the close on the news of gold imports from London. In the early part of the next week the tendency was slightly upward, but later New England, the other active stocks, and Manhattan were freely sold with an unsettling effect. The raiding was continued early in the last week, when Missouri Pacific fell heavily, and the circulation of reports of a disquieting character caused the market to close feverish. One feature was the failure of a house which had borrowed upon unsalable bond collaterals, and this induced lenders to discriminate against securities for which a ready market could not be found. There was a better feeling at the opening of September. The announcement was made that a syndicate of responsible bankers had undertaken to relieve the embarrassments of the Baltimore and Ohio Railroad Company by advancing money with which to pay off the floating debt on condition that the entire property should be managed in harmony with competing lines. One feature was the sale by the Oregon and Transcontinental of about \$5,000,000 of its treasury stock, thus giving that company financial relief. On the first day of the month the announcement was made that the Baltimore and Ohio express line had been sold, and, as this was regarded as preliminary to the sale of the telegraph lines, Western Union sharply advanced. The improvement was not sustained, however, and the market was unfavorably affected on the 7th by the refusal of the Acting Secretary of the Treasury to buy bonds at the price at which they were offered. Considering the strained condition of the money market this was regarded as unfortunate, and the bears took advantage of the fear that serious trouble would follow. The market was kept in a feverish state for the remainder of that week and in the next, and it was only temporarily strengthened on the 14th by the purchase of \$4,000,000 bonds by the Treasury. Toward the close of that week the discussion of a new policy of financial relief had somewhat of an assuring influence, but the failure of the Secretary to promptly act upon the suggestions made by leading bankers caused a panicky fall in stocks on the 20th, which was checked before the close of the day by supporting orders and by purchases for European account. On the following day the announcement was made that the Secretary had decided to purchase 4

and $4\frac{1}{2}$ per cents. to the extent of \$14,000,000, and also to pay the October interest, amounting to \$8,500,000, without rebate. This caused a recovery, and, although feverish, the market was generally strong for the remainder of the week and to the close of the month. Pacific Mail rose sharply on news that Mr. Gould had obtained control, and there was also a rapid rise in Central New Jersey on an intimation that the floating stock was very small. One feature early in October was the purchase on the 7th by Mr. Gould, for the Western Union, of the Baltimore and Ohio Telegraph line for 50,000 shares of the stock of the first-named company, and on the 28th it was announced that the Postal and United lines had agreed to an advance in rates to the Western Union tariff, thus settling the telegraph war. Another feature was easier money, the result of the Treasury bond purchases, gold imports, and liberal deposits of public funds in the designated depositories. The bear party devoted their attention early in the month to raids upon Richmond Terminal, New England, and the Grangers, and the fall in the latter was assisted by news of cutting of rates. During the second week Reading, Western Union, the Grangers, Erie, and Missouri Pacific were attacked in turn, and the passing of the quarterly dividend by the Baltimore and Ohio had a disturbing effect, as also did the report of an interview in a St. Louis paper with Mr. Chauncey M. Depew, in which that gentleman was represented as predicting serious disasters as the result of excessive construction of railroads and speculation in Western and Southern lands. This statement caused free selling of the Vanderbilt properties, and the fall in these had a demoralizing effect upon the whole list. During the third week the explanation given by Mr. Depew of his statements to the reporter, good support of the Vanderbilts, buying of stocks for European account, and covering of short contracts by the smaller bears, caused a more or less decided recovery, and the tone was generally stronger until toward the close when the bears renewed their demonstrations, forcing important declines in Missouri, Kansas, and Texas bonds, by the aid of a rumor, subsequently shown to be false, and the market was unsettled at the end of the month. Only ten of the active stocks showed an improvement compared with the opening, and Rock Island fell 11 points. Mr. Gould left for Europe on the 29th, intending to be absent for several months. The bears were apparently content with attacking Missouri Pacific after Mr. Gould's departure, but soon after the opening of November good buying of the coal-shares and of Western Union had a stimulating influence, and subsequently there was an important rise in the trunk-lines and in the Grangers. During the second week the Gould specialties took the lead, followed by Reading, the Vanderbilt properties, and Union Pacific, and the tone was strong for the next fortnight, the impression

that the bear campaign was at an end encouraging purchases by non-professional speculators. This resulted in such a wide distribution of stocks that the bears resumed their demonstrations with more or less success, but the market was generally strong to the close, although a little activity in money made the movement irregular in the last days of the month. One feature was the issue of decrees removing the receivers of the Reading and of the Central New Jersey, and another was the negotiation of a third mortgage on the Northern Pacific. Comparisons show a gain for the month in all but eleven of the active stocks, and the most important was 10½ per cent. in Union Pacific on news of more harmonious relations with the Northern Pacific and the Oregon lines. Stocks were comparatively strong during the first few days in December, the market being affected by the ending of the French political crisis, which imparted a more confident tone to the foreign markets. Then followed a temporary derangement due to the tariff recommendations contained in the President's message, the bears were encouraged to renew their demonstrations, and the decline was assisted by news of unsettled markets abroad caused by the movements of the Russians on the Austrian frontier. The raiding was confined to Richmond Terminal, New England, the coal-shares, and the Grangers, but toward the close of the second week the market was turned upward by news of the restoration of rates for dressed beef, which had been cut by the Grand Trunk, and the tone was generally strong until the last week in the month, although at intervals irregular and fractionally lower. The attempt of the Knights of Labor to force a strike on the Reading on the 25th proved abortive, and on the following day there was a decided advance in this property, the other coal-shares, and indeed in all the active stocks, the market having been oversold in expectation that the strike would succeed. Then came realizing sales and a renewal of bearish pressure based upon rumors regarding the intentions of the Knights, but there was a steadier feeling at the close of the month.

The following is a list of quotations of leading stocks at the beginning of January, 1886, 1887, and 1888:

LEADING STOCKS.	1886.	1887.	1888.
New York Central.....	106½	118½	107½
Erie.....	96½	84½	98½
Lake Shore.....	89	90½	94½
Michigan Central.....	77	98½	67½
Rock Island.....	128½	128½	112½
Illinois Central.....	140	138	118½
Northwestern, common.....	110½	115½	107½
St. Paul, common.....	96½	90½	75½
Dela., Lackawanna, and Western.....	12½	18½	129½
Central New Jersey.....	44	55½	75

Total sales of all stocks for the year 1887 were 85,291,028 shares against 100,802,050 in 1886; 93,184,478 in 1885; 95,416,868 in 1884; 93,037,905 in 1883; 113,720,665 in 1882; and

118,892,685 in 1881. The transactions in Government bonds during 1887 were \$7,110,400, and in railroad and miscellaneous bonds \$347,-127,830.

The following is a list of a few of the speculative stocks, the highest prices at which they sold in 1886, and the highest and lowest in 1887:

SPECULATIVE AND OTHER SHARES.	1886.	1887.	
	Highest.	Highest.	Lowest.
Canadian Pacific.....	78	66½	49½
Canada Southern.....	71½	64½	49
Central New Jersey.....	64	86½	55½
Central Pacific.....	51	43½	26½
Chattanooga.....	105½	88½	62½
Cleveland, Col., C., and Ind.....	75½	68	47½
Consolidated Gas.....	111	89	67
Delaware and Hudson.....	108½	106½	90½
Dela., Lackawanna, and Western.....	144	139½	122½
Erie.....	38½	35½	24½
Hocking Valley.....	42½	39½	15
Lake Shore.....	104½	95½	69
Louisville and Nashville.....	66	70½	56½
Manhattan Elevated Consol.....	175	161½	92½
Memphis and Charleston.....	69½	64½	45
Michigan Central.....	9½	95½	80
Minnesota and St. Louis.....	28½	20½	5½
Minnesota and St. Louis, pref'd.....	52½	45½	15
Missouri, Kansas, and Texas.....	36½	34½	16½
Missouri Pacific.....	119	112	64½
New York Central.....	117½	114½	101½
New York and New England.....	66½	66	34½
Northwestern.....	124½	127½	104½

Pacific Mail.....	67	56½	32½
Reading.....	58½	71½	34
Richmond Terminal.....	77½	58	20½
St. Paul.....	99	95	68½
Texas and Pacific.....	28½	32½	20
Union Pacific.....	68½	67½	44
Western Union.....	80½	81½	67½

FINE ARTS IN 1887. Under this title are treated the principal art events of the past year, ending with December, 1887, including especially the great exhibitions in Europe and the United States, the sales and acquisitions of works of art, and the erection of public statues and monuments.

Paris: Sales.—The exhibition (May 1 to June 30) comprised 5,818 numbers, classified as follows: Paintings, 2,521; cartoons, water-colors, pastels, porcelain pictures, etc., 1,042; sculpture, 1,046; engraving in medals and precious stones, 46; architecture, 187; engraving, 476.

Section of painting: Medal of honor awarded to Fernand Cormon. No first-class medal awarded. Second-class medals: Henri Saintin, Eugène Buland, Lucien Doucet, Pierre Marie Beylo, Albert Fourié, Eugène Carrière, Maurice Francis Auguste Courant, Armand Berton, Joseph Bail, Jean Desbrosses, Arturo Michelena, Félix Lucas, Alexandre Thiollet, Gaston Guignard, Antoine Paul Émile Morlon. Third-class medals: Jules Alexis Muenier, Gabriel Thurner, Léon Tanzi, Louis Auguste Georges Loustaunau, Eugène Henri Alexandre Ohigot, Eugène Claude, Anton Mauve, Prosper Galerne, Maurice Eliot, Mlle. Jeanne Rougier, M^lle. Elizabeth Jane Gardner, Jules Charles

Aviat, Eugène Chaperon, Luis Jimenez, Pierre Louis Léger Vauthier, Julius de Payer, Edmond Picard, Emile Cagniard, Victor Henri Lesur, Jean Jacques Scherrer, Louis Auguste Girardot, Jean André Marty, Stephen Jacob, Mlle. Anna Bilinska, Raoul Arus, Camille Dufour, Georges Russon, Théophile Deyrolle.

Among the "mentions honorables" are the following American artists: O. S. Reinhart, J. Carroll Beckwith, George Hitchcock, and Francis B. Chadwick. Elizabeth Jane Gardner is the only American that received a medal.

Section of sculpture: Medal of honor awarded to Emmanuel Fréniot. First-class medal: Jules Desbois, for his marble statue of "Acis changed into a Flower" (owned by William Schaus, New York). Second-class medals: Jean Sul-Abadie, Félix Charpentier, Henri Peinte, François Roger, Raoul Charles Verlet, Michel Léonard Béguine, Jeanne Marie Mengue. Third-class medals: Edouard Charles Houssin, Émile Louis Truffot, Alphonse Voisin-Dela-croix, Virginus Arias, Georges Gardet, ——— Cadoux, ——— Lequeult, Guillaume Charlier, Charles Joseph Roufosse, Paul Berthet.

Section of engraving: Medal of honor awarded to Charles Courty. No first-class medal awarded. Second-class medals: Messrs. Bontelier (line engraving), Kœpping, Gaujean, & Mathy (etching), Lepère (wood engraving), Lunois, Vergnes (lithography). Third-class medals: Messrs. Abot (line engraving), Ardail, Kratké (etching), Hnyot, Florian (wood engraving), Bahuet (lithography).

Section of architecture: No medal of honor awarded. First-class medal: Charles Wable. Second-class medals: Messrs. Devienne, Deglanne, Bonnier, Esquié, and Monnier. Third-class medals: Messrs. Louzier, Joannis, Debrie, Gontier, Touzet, and Balleyguier.

The *Salon* receipts for the season were 828,190 francs.

Among the noteworthy pictures was Fernand Cormon's "Victors of Salamis," a large work, commissioned by the state, and to which was awarded the medal of honor. On the sea-shore, with sea and ships in the distance, is a throng of Greek victors, with citizens, women, and children in festal attire, dancing for joy or moving around in a circle, shouting and singing in triumph as they wave aloft weapons and palms of victory. Some hold sistrums, cymbals, and timbrels, many are wounded, and a few are laden with spoil. This, one of the most striking pictures of the season, was always surrounded by admiring crowds.

Another historical picture of large size (80 feet long), by Francis Tattegrain, illustrates a passage in the chronicle of Jean Le Fèvre, "The Surrender of the Casselois to Philippe le Bon, of Burgundy, in the Marsh of Saint-Omer." In the mid-distance the duke, in armor, with his visor up, and mounted on a handsomely caparisoned horse, is halted with his attendants on a low ridge of land, while in the foreground are the people of Cassel, all

kneeling and bareheaded, with their weapons and shields cast down. A group of soldiers, civic dignitaries, and priests prostrate themselves before the duke's horse, while the pitiless storm, hail and snow mingled with rain, beats on their heads, and nearly blows away their crape-dressed banners.

Alexandre Paul Protais's "Convoy of Wounded" is a fine landscape, with a long line of men and vehicles passing at evening along the edge of a meadow in the shadow of trees, and descending into a valley, where twilight mists are mingled with the rays of the setting sun. Lancers, dragoons, artillerymen, and infantry move slowly along, with here and there an ambulance-wagon or a group of officers directing the march.

Puis de Chavannes exhibited the cartoon of an immense composition (85 feet x 20 feet), intended for the decoration of the hemicycle of the grand amphitheatre of the Sorbonne, symbolizing the ancient Sorbonne, and Eloquence recounting the struggles and triumphs of the human intellect. The left of the three panels is devoted to Philosophy and History, and the right to Science.

François Flameng's "History of Literature," intended for the decoration of the staircase of the same building, is also a triptych. The first panel represents Saint Louis delivering the charter of the institution to Robert de Sorbon, the second, Abélard and his school, and the third, Jean Heynlin setting up in the cellars of the Sorbonne the first printing-press established in France.

Opposite Puis de Chavannes's huge work hung another large decorative canvas, "The Evening of Life," by Paul Albert Besnard, intended for the mairie of the first arrondissement. On the threshold of a house are seated an old couple, the wife resting her head on the shoulder of her husband, who, leaning on his staff, looks upward at the stars. Behind them a mother and child represent the earlier stages of life. It is a poetical work, nobly designed and technically fine.

Bouguereau's "L'Amour Vainqueur" shows a Cupid bearing triumphantly through the air a beautiful female child, who clings submissively to her conqueror.

Alexandre Cabanel's "Cleopatra," illustrating a passage in Plutarch's "Life of Antony," represents the Egyptian queen in a vast hall reclining languidly on a lion-skin, with a leopard at her feet and a female slave behind her, watching the effect of poisons on unfortunate wretches selected for experiment. One of her victims rolls in agony on the floor, while two slaves bear away the body of another.

Georges Clairin's "Funeral of Victor Hugo—Evening," is another huge canvas. A long line of cuirassiers, sitting motionless on their horses, hold torches which light up a catafalque covered with flowers, while above, a winged spirit, apparently representing Poetry, shrouds herself in a black veil and holds a golden crown.

Georges Rochegrosse contributed two pictures, "La Curée," a large work illustrating Plutarch's account of the death of Julius Cæsar in the Senate House, and a smaller one, "Salome dancing before Herod." In the former, Cæsar, wounded, lies at the base of Pompey's statue, the center of a knot of assassins, among whom Brutus is prominent, all striving to stab him. In the background, which is all white marble, are many figures in confusion, some flying between the columns of the portico, some hiding their faces, and some rushing forward with drawn daggers. In the smaller picture, the daughter of Herodias dances to the music of a band of negroes and Egyptians seated on the floor in a ring, of which she is the center, before Herod and his companions seated on a dais.

Benjamin-Constant is represented by two pictures, "Orpheus" and "Theodora," the latter a vigorous piece of melodramatic art, magnificent in details. The Empress Theodora, seated on a throne of white marble, rests both her jeweled wrists on its arms. Her robe of dark silk is set with jewels and loaded with gold ornaments, and on her head is a Byzantine crown studded with precious stones, contrasting strongly with the pale bronze of her face and her cruel, snake-like eyes. "Orpheus" represents the singer, entirely nude, advancing through a rocky, dimly lighted gorge into the depths of a mysterious night.

Henry Rachou's "How the Dauphin of France entered Paris" is an illustration of Henri Martin's description of the scene after the revolt of Étienne Marcel. The dead bodies of Marcel and his partisans are stretched upon the steps of the Church of St. Catherine as a long line of knights armed *cap-à-pie*, riding on splendidly caparisoned horses, pick their way among corpses.

Henner was represented by "A Creole" and "Herodias," the latter a young girl with disheveled auburn hair, clad in bright scarlet, standing against a brown wall, holding the charger and head. Carolus Duran's "Andromeda" is a masterly nude figure, with a profusion of blonde hair, against a background of grayish-green rocks. Jules Lefebvre's "Morning-Glory" is an idealized female figure with pale-yellow locks twined with the flowers which give the picture its name.

Among the best of the *genre* pictures was Gaston Mélingue's "Molière and his Company," representing the dramatist reading one of his plays to a small audience.

Of the noteworthy religious pictures, Herr von Uhde's "Last Supper" is as characteristic as his "Christ with the Little Children" of the Salon of 1885. Deschamps's "Sleep of Jesus" and Dinet's "Adoration of the Shepherds" are somewhat similar attempts to excite pathos and religious fervor through eccentricity of treatment.

Julian Story's "Episode of the Massacres of September, 1792," is from Lamartine's "His-

toire des Girondins." It represents Mlle. de Sombreuil drinking a goblet of human blood at the dictation of the mob to save her father from the guillotine. It is a powerful picture, and was awarded honorable mention, but its subject is too hideous for art.

American art was also represented in the Salon by Elizabeth Jane Gardner's "Farmer's Daughter" (2d class medal) and "Innocence," James Carroll Beckwith's "Portrait of William Walton" (honorable mention), Charles Sprague Pearce's "St. Geneviève," Frederick A. Bridgman's "On the Terraces, Algiers," Daniel Ridgeway Knight's "In October," Alexander Harrison's "Twilight," Walter Gay's "Petition to Richelieu," and by many others.

The Académie des Beaux-Arts awarded the biennial prize of 20,000 francs, given to the author of the work most creditable to the country, to the sculptor Antonin Mercié for his tomb of Louis Philippe and Queen Amélie, exhibited at the Salon of 1886. The 10,000-franc prize was awarded to Émile Paladilhe, music composer.

London: Royal Academy.—The eighteenth winter exhibition was devoted, like the preceding one, to works of the old masters and deceased British artists, gathered from the collections of Buckingham Palace, the Duke of Wellington, the Earl of Normanton, Lord Leconfield, Lord Carnarvon, Mr. Charles Butler, Mr. R. S. Holford, and many others. Among the old masters represented were Velasquez, Murillo, Raphael, Titian, Tintoretto, Rembrandt, Rubens, Vandyke, Frans Hals, Hobbema, Ruysdael, Cuyp, and, of the more modern schools, Greuze, Sir Joshua Reynolds, Gainsborough, Hogarth, Prout, William Collins, and Turner, the last by a collection of more than a hundred water-color drawings.

The one hundred and nineteenth annual exhibition opened in May, with 1,946 numbers, selected from nearly 5,000 contributions, including oil-paintings, water-colors, works in black and white, architectural drawings, and sculptures.

Among the prominent contributions were "Mariamne," by J. W. Waterhouse, representing the wife of Herod the Great going to execution after her trial for the false charges brought against her by Salome and others. By the side of the king, who is seated on his throne at the right, stands Salome, while Mariamne stands on a marble staircase in the foreground. In the background are seated the judges.

"The Last Watch of Hero," by Sir Frederick Leighton, exhibits her, in a dark-blue mantle over a rose-colored robe, gazing anxiously forth from between marble columns, just tinted with the sunrise. In a predella below is a smaller picture in brown monochrome, showing the fate of Leander. The picture goes to the Manchester Gallery.

"The Women of Amphissa," by L. Alma-Tadema, represents the market-place of that

city with sleeping Bacchantes, with white robes, ivy wreaths, tambourines, and leopard-skins, watched over by the women of the city. Dawn is breaking over the marble pavement and columns of the buildings.

"Mercy," by Sir J. E. Millais, is a scene on St. Bartholomew's Day, 1572, and a companion piece to "A Huguenot." A priest, standing in an open door, is beckoning a soldier, bearing the badge of the cross, to join in the massacre, while a kneeling nun is attempting to restrain him.

"Samson," by S. J. Solomon, is a large canvas (8 feet high x 12 feet), representing the struggle of the strong man with the Philistines after his locks are shorn.

Briton Riviere's "Old World Wanderer" represents a Greek explorer who has landed on the shore of a rocky bay from a galley seen in the distance. He is walking along, spear in hand, his presence unnoticed by the gulls, which have never had cause to fear a human being.

"Misery and Mercy," by Frederick Goodall, is the oft-told story of Christ and the adulteress. "The Institution of the Franciscan Order," by Edward Armitage, is a large picture (11 feet, 6 inches x 17 feet) painted for St. John's Catholic church, Islington. "The First Cloud" is one of W. Q. Orchardson's best and most characteristic pictures, representing a handsome drawing-room interior, with a husband standing with his back to the fire, while his wife walks out in graceful anger. It goes to Australia. John S. Sargent's "Carnation, Lily, Lily, Rose," two little girls in a garden, with a foreground of lilies and rose-carnations, has been purchased by the Royal Academy under the Chantry bequest.

Marcus Stone and Luke Fildes were elected full members of the Royal Academy, and Alfred Gilbert, sculptor, an associate member. W. F. Calderon was elected Keeper of the Royal Academy in place of Frederick R. Pickersgill, resigned.

London: Grosvenor Gallery.—The winter exhibition consisted of a collection of 166 works of Sir Anton Van Dyck, principally portraits, including many of the best examples from Windsor and other noble collections throughout England. Among them were the well-known portraits of Charles I, of Henrietta Maria, and of their children, of Van Dyck himself, and of many of the lords and ladies of the time whom he depicted. Other pictures were "Armida and Rinaldo," "The Betrayal of Christ," "Dædalus," "Virgin and St. Catherine," "Christ giving the Keys to Peter," and a "Pieta."

The eleventh summer exhibition of the Grosvenor Gallery contained 420 numbers, including oil-paintings, water-colors, and sculpture. Among the noteworthy pictures were the contributions of Edward Burne-Jones, "The Garden of Pan," representing the youthful god playing to a nude youth and maiden, seated. "The Boleyn Head," one of a series illustrative

of the story of Perseus and Andromeda, exhibits the former showing the latter the reflection in water of the head of Medusa. By him also were a portrait of a damsel in lapis-lazuli blue seated before a circular mirror; "Katie," a girl lying on a sofa reading; and a memorial tablet. George F. Watts's "Judgment of Paris" represents the three goddesses standing facing the spectator in a golden haze on a floor of clouds. Holman Hunt sent two works, "Amaryllis" (an illustration of Herrick's "Pastoral Song to the King"), and "Master Hilary the Tracer," a boy tracing a picture at a window. E. J. Poynter's "Corner in the Market-Place" represents a young mother seated on a marble bench watching an infant playing on the floor, with a girl seated beside it binding a wreath. W. B. Richmond's "Icarus" depicts him at the moment of starting on his flight from a high rock above the sea. C. E. Halle's "Buondelmonte and the Donati" is an illustration of an incident which led to the war of the Guelphs and the Ghibellines, as related in Machiavelli's "History of Florence." Sir John E. Millais and Hubert Herkomer contributed portraits.

An exhibition of a collection of the works of Basil Vereschagin, the Russian painter, was held in the Grosvenor Gallery in October. Among the pictures were: "After the Battle," "Blowing from Guns in British India," "The Spy," "Skobelev at Shipka," "The Road of the War Prisoners," "Before the Attack," "The Future Emperor of India" (entrance of Prince of Wales into Jeypore), and "Crucifixion by the Romans."

London: Miscellaneous.—The art sales in 1887 were not as noteworthy as those of the preceding year. One of the most interesting was the famous collection of engravings made by the late Duke of Buccleugh, begun March 8, and lasting twelve days, including the works of Landseer, Sir Joshua Reynolds, Adrian van Ostade, and others, and a nearly full set of Rembrandt's etchings. High prices were obtained for some of the rarer states of fine examples by Rembrandt: The Hundred-Guilder Piece, "Jesus Healing the Sick," first state, £1,800; "Coppenol," large plate, second state, £1,190; "Coppenol," small plate, first state, £320; "Jesus before Pilate," first state, £1,150; "Portrait of Van Tolling," second state, £800; "Abraham Frasz," second state, £510.

On April 2 the collection of Charles H. Rickards, of Manchester, was sold, including 57 pictures and designs by George F. Watts, which realized £15,686. Of these, many of which were replicas, "Love and Death" went at £1,155; "Love and Life," £1,207; "Return of the Dove," £908; "Angel of Death," £577; "Time, Death, and Judgment," £525. The portrait of Herr Joachim was bought for the Chicago Gallery at £441. At the same sale Alma-Tadema's "Emperor Hadrian visiting a Romano-British Pottery" (R. A., 1884) was sold for 750 guineas; Vicat Cole's "Heart of

Surrey" (1874) for 680 guineas; and George H. Boughton's "Music Lesson" (1880) for 800 guineas.

The J. Graham collection, sold April 30, realized a total of £61,347. Among the notable canvases disposed of were: Paul Delaroche, "Christian Martyr," 550 guineas; "Mary Magdalene," 620 guineas; "St. John in Patmos," 580 guineas. Henri Leys, "Antwerp during the Spanish Occupation," 1,400 guineas. J. L. Gérôme, "The Nile Boat," 1,500 guineas. Rosa Bonheur, "Early Morning in Forest of Fontainebleau," 810 guineas; "Highland Raid," 3,900 guineas. Sir Edwin Landseer, "The Shepherd's Bible," 1,020 guineas. Holman Hunt, "Finding of Jesus in the Temple," 1,200 guineas. John Linnell, "Edge of the Wood," 550 guineas; "Christ and the Woman of Samaria," 570 guineas; "Under the Hawthorn-Tree," 1,020 guineas; "The Sheep Drove," 1,850 guineas; "Return of Ulysses," 1,400 guineas; "The Peat-Gatherers" (with Cox), 215 guineas. Sir John E. Millais, "Dream of the Past," 1,300 guineas. D. G. Rossetti, "Venus Verticordia," 450 guineas; "Pandora," 550 guineas. Sir David Wilkie, "The School" (his last work), 1,650 guineas. Edward Burne-Jones, "Fides" (tempera), 440 guineas; "Sperantia" (tempera), 640 guineas. Turner, "Italian Landscape," 1,100 guineas; "The Wreck Buoy," 1,000 guineas; "Van Goyen going about to choose a Subject," 6,500 guineas; "Mercury and Argus," 3,600 guineas. Sir Joshua Reynolds, "The School-boys" (Masters Gawler), 2,310 guineas. Gainsborough, "The Sisters" (Lady Day and Baroness de Noailles), 9,500 guineas.

In May Edwin Long's "Christmas at Seville" (1868) sold at Chrystie's for 1,030 guineas; John Linnell's "Storm in Harvest," 1,450 guineas; Holman Hunt's "Scene from 'Two Gentlemen of Verona,'" 1,000 guineas (Birmingham Museum); "The Scapegoat," 1,850 guineas; David Cox's "Going to the Hay-field," 1,805 guineas.

In Mr. Kaye Knowles's collection, sold May 14, which brought £18,343, were: Meissonier, "The Smoker" (water-color), 500 guineas; Alma-Tadema, "A Bacchante—There he is" (1875), 550 guineas; Millais, "Over the Hills and Far Away," 5,000 guineas (G. Glayton).

The collection of the Earl of Lonsdale, sold in June, realized £62,702, of which the pictures brought £28,713. Among the noteworthy canvases were: Reynolds, "Laughing Girl," 240 guineas. J. B. Pater, "The Toilet," 345 guineas. F. Drouais, "Madame du Barri," 950 guineas; "Flower-Gatherers," 1,000 guineas. Gainsborough, "Horses Drinking," 1,620 guineas. Pannini, "Exterior of St. Peter's," 800 guineas; "Interior of St. Peter's," 1,100 guineas. J. B. Santerre, "Mlle. Charlotte Desmoures," 2,000 guineas. Boucher, "Madame de Pompadour," 9,900 guineas.

In July, Gainsborough's portrait of the "Hon. Mrs. Henry Fane" (1777), from Fulbeck Hall, Frantham, sold for 4,586 guineas.

Manchester.—In the exhibition in honor of the Queen's Jubilee the fine-art section was an epitome of the history of British art within the Victorian era. The thirteen picture-galleries were painted and decorated under the supervision of Mr. Burne-Jones, who was himself represented by twelve pictures, including the "Wheel of Fortune," the "Chant d'Amour," and the series illustrating the "Story of Pygmalion." Ten works by Dante Rossetti hung in one gallery, among them "Dante's Dream," "Beata Beatrix," "The Blessed Damosel," and "The Blue Bower." Holman Hunt was represented by five examples, including "Claudio and Isabella," "The Scapegoat," and "The Shadow of the Cross"; and Ford Madox Brown by his "Work," "Romeo and Juliet," and "Cromwell on his Farm." Sir John E. Millais had fifteen works, among them "The Vale of Rest," "The Boyhood of Raleigh," "Asleep," "Awake," and the wonderful portrait of "Cardinal Newman." Alma-Tadema's "Painter's Studio," "Sculptor's Studio," "Parting Kiss," "Vintage Festival," "The Apodyterium," and others, nearly filled one room; and George Frederick Watts's twenty-three pictures, including "Love and Death" and many of his portraits, dominated another. Edwin Long's "Diana or Christ" and "Babylonian Marriage-Market," Sir Frederick Leighton's "Daphnephoria," and characteristic works by Sir James Linton and Messrs. Poynter, Fildes, Orchardson, Gow, Vicat Cole, Hook, Miss Montalba, and numerous others, made up a large and most interesting collection.

St. Petersburg.—The Hermitage has been enriched by the collection of Prince Galitzin, acquired by the Government for 800,000 rubles, comprising, besides painting and statuary, porcelain, tapestries, and valuable illuminated books and manuscripts of the fourteenth and fifteenth centuries. The most important picture is a triptych by Raphael, representing Christ on Calvary, surrounded by the Virgin, St. John, and two other persons, formerly presented by the confessor of Pope Alexander VI to the Dominicans of San Gimignano, and acquired by Prince Galitzin in 1840.

United States: Exhibitions, etc.—The National Academy of Design, New York, held its sixty-second annual exhibition (April 4 to May 14), with 503 works. The sales at the close amounted to \$33,000. J. Francis Murphy was elected an academician, and Alfred Kappes, Frederick W. Freer, Walter L. Palmer, Thomas W. Dewing, and Walter Shirlaw, associates. The Clarke prize for the best figure-composition was awarded to Thomas W. Dewing for his decorative picture entitled "Days." The first Hallgarten prize, \$300, was given to Alfred Kappes for his *genre* picture, "Buckwheat Oakes"; the second, \$200, to Walter L. Palmer for landscape, "January"; the third, \$100, to D. W. Tryon, for a landscape. Messrs. Palmer and Tryon being ineligible as to age,

their prizes could not be given to them, and they will probably be added to those of next year. The Norman W. Dodge prize of \$800, for the best picture painted in the United States by a woman, was awarded to Mrs. Mary Curtis Richardson for her portrait-piece entitled "Lenten Lilies."

At the third annual Prize Fund Exhibition of the American Art Association, held in New York in May, the catalogue contained 242 numbers, including pictures and sculpture. Two prizes of \$2,000 each were awarded as follows: Charles H. Davis for his landscape entitled "Late Afternoon"; Edward Gay for a landscape, "Broad Acres." The former belongs to the Union League Club and the latter to the Metropolitan Museum. Ten gold medals of \$100 each were distributed as follows: Robert Blum for "Venetian Lacemakers"; W. L. Dodge, "Death of Minnehaha"; Horatio Walker, "Milkmaid"; George W. Maynard, "Sappho"; Carlton Wiggins, "Early Morning"; J. F. Murphy, "September Afternoon"; F. D. Millet, "Difficult Duet"; J. Scott Hartley, "Satan Vanquished" (sculpture); George Hitchcock, "Toilers of the Sea"; D. W. Tryon, "Night."

The Society of American Artists held its ninth annual exhibition at the Yandell Gallery, New York, April 25 to May 14, with 148 entries. A prize of \$800, offered to the society by Dr. W. Seward Webb for the best landscape by an American artist under forty years of age, was awarded to J. Francis Murphy for his "Brook and Field."

The American Water-Color Society's twentieth annual exhibition, held in New York (January 31 to February 26), contained 656 works. An exhibition of works by the New York Etching Club was held in one of the rooms of the Academy at the same time.

An exhibition of 223 pictures by French artists was held at the Academy, New York (May 25 to June 30), under the management of M. Durand-Ruel, of Paris. The place of honor was occupied by Eugène Delacroix's great picture, "The Death of Sardanapalus" (Salon, 1827), which marked the transition of the French school from classicism to romanticism. Other noted pictures were ten studies by Puvis de Chavannes, from which were painted the mural decorations of the Pantheon in Paris and the museum at Amiens; Manet's "Death of Maximilian," and examples by Henner, Renoir, Monet, Jules Dupré, and other famed artists.

The Metropolitan Museum has received, by bequest of Miss Catherine L. Wolfe, late of New York, a magnificent collection of about 200 works in oil and water-color, valued at from \$400,000 to \$500,000. It includes chiefly fine examples of the modern French and German schools. Another noteworthy gift, by George I. Seney, of Brooklyn, consists of about twenty pictures, including Lerolle's "Organ Rehearsal," Julian Dupré's "The

Balloon," and Josef Israel's "Expectation" and "Bashful Suitor." Other works acquired by the museum during the past year are "Christopher Columbus at the Court of Ferdinand and Isabella," by Václav Brožík, presented by Morris K. Jesup, who purchased it for \$30,000; "The Horse Fair," by Rosa Bonheur, presented by Cornelius Vanderbilt; "1807," by Meissonier, and "The Defense of Champigny," by Detaille, presented by Henry Hilton; "Thusnelda at the Triumph of Germanicus," presented by Horace Russell; "The Vintage," by L'Hermite, presented by William Schaus; "Trustees of the Earl of Westmoreland," by Sir Joshua Reynolds, presented by Junius S. Morgan, London.

Among the important pictures exhibited in New York during the past year were "The Gilder" (Le Doreur), one of Rembrandt's best works, purchased by William Schaus from the heirs of the De Morny estate; "Christ before Pilate," "Christ on Calvary," and "The Death of Mozart," by Mihail Munkacsy; "Madonna and Child," by Franz Defregger; "Tel-el-Kebir," by Alphonse de Neuville; "Une Bergère—Souvenir de la Picardie," by Charles Sprague Pearce, which won the great medal of honor at Ghent, 1886; "Russian Wedding Feast," and "Choosing the Bride," by Konstantin Makoffsky; "The Wise and Foolish Virgins," by Carl von Piloty; "Diana's Hunting Party," and "The Five Senses," by Hans Makart; "Elaine," by Toby Rosenthal; "The Two Sisters," by Charles Giron. Munkacsy's "Christ before Pilate" has been purchased by John Wannamaker, Philadelphia, for more than \$100,000, and his "Last Days of Mozart," for \$50,000, by R. A. Alger, Detroit, who has presented it to the Detroit Museum. Benjamin-Constant's "Justinian" (Salon, 1886) has been bought by Robert Mannheimer, St. Paul, Minn.; De Neuville's "Tel-el-Kebir" has been purchased by James Hill, also of St. Paul.

The most important art sale of the year was that of the A. T. Stewart collection, which was exhibited at the American Art Galleries, New York, from February 21 until the sale, March 28, and the following days. An illustrated edition of the catalogue, limited to 500 copies, with etchings of the pictures by prominent artists, was issued. The total amount of the sale, including pictures, sculptures, bronzes, ceramics, books, etc., was \$581,933. Among the best prices obtained were: Meissonier, "1807," \$66,000, "At the Barracks," \$16,000, "Charity," \$10,500; Rosa Bonheur, "Horse Fair," \$58,000; Auguste Bonheur, "Environs of Fontainebleau," \$17,800; Gérôme, "Chariot Race," \$7,100, "The Gladiators," \$11,000, "Une Collaboration," \$3,100; Erskine Nicoll, "The Disputed Boundary," \$15,250; Mariano Fortuny, "The Serpent Charmer," \$13,100, "Beach at Portici," \$10,100; Ludwig Knaus, "The Children's Party," \$21,800; Constant Troyon, "Landscape and Cattle," \$11,000, "Cattle," \$7,150; Bouguereau, "Homer and

his Guide," \$5,200, "Return from the Harvest," \$8,100; Zamacois, "The Begging Monk," \$4,400; Piloty, "Triumph of Germanicus," \$3,900; F. E. Church, "Niagara Falls from American Side," \$7,050 (Edinburgh Gallery); Daniel Huntington, "Lady Washington's Reception," \$3,800; Daubigny, "End of Month of May," \$7,900; Munkacsy, "Visit to the Baby," \$8,700; Benjamin-Constant, "Evening on the Terrace," \$4,000. The price paid for Meissonier's "1807" was the highest, and that for Rosa Bonheur's "Horse Fair" the second highest, ever given for a picture at an auction sale in this country.

The collection of Henry Probasco, of Cincinnati, sold in New York, April 18, realized more than \$170,000 for 102 works. Among the highest prices obtained were: Rousseau, "Summer Landscape," \$21,000, "Forest at Fontainebleau," \$7,400; J. F. Millet, "Peasants bringing home a New-born Calf," \$18,500; Jules Breton, "Colza Gatherers," \$16,600; Troyon, "Landscape with Cattle," \$10,000; Schreyer, "Russian Landscape," \$6,900; Eugène Delacroix, "Clorinda delivering the Martyrs," \$6,000.

A collection of pictures, engravings, art books, etc., belonging to the estate of Asher B. Durand, sold also in New York in April, brought \$10,656, of which \$9,200 was for eighty studies by the artist.

The Richard H. Halstead collection, sold in New York, January 10, brought \$84,320. Works by Bouguereau and by Vibert brought respectively \$7,600 and \$7,300, and William Bliss Baker's "Woodland Brook," \$2,800. At the Robert Graves sale, New York, February 9 to 11, Corot's "Landscape with Figures" brought \$10,100; Bouguereau's "Cupid Disarmed," \$7,700; "Le Jour," \$5,500; "Little Sufferer," \$2,525; Rousseau's "Oak Tree in Autumn," \$2,000; David Johnson's "On the Unadilla," \$1,575.

The Charles F. Haseltine collection of modern French works was sold in New York, February 15 to 17, and realized \$107,177.

The fifty-seventh annual exhibition of the Pennsylvania Academy of Fine Arts, Philadelphia (March 10 to April 21), comprised 690 numbers, including oil and water-color pictures, black and whites, and sculptures. Among the black and whites were E. A. Abbey's drawings for "She Stoops to Conquer," first exhibited at the Grolier Club, New York. The endowment fund of \$100,000, asked for by the Academy, has been more than filled by the subscriptions of about seventy persons.

A statue of John O. Calhoun, by Harnisch, a Philadelphia sculptor resident in Rome, was unveiled in Charleston, S. C., in April. He is represented seated in a chair, and the work is to be supplemented by accessory statues of Truth, Justice, the Constitution, and History, to be finished next year.

A statue of Gen. Garfield, standing, with arm extended, was unveiled in May in Washington.

Figures on the pedestal represent a studious youth, a warrior, and a statesman, emblematic of periods in his career.

A bronze statue of Nathan Hale, by Carl Gerhardt, was unveiled at Hartford, Conn., in June. The figure, which is of heroic size, represents him standing with his palms open as if addressing the crowd about his place of execution.

A soldiers' and sailors' monument, dedicated to those who fell in the civil war, was also unveiled at Hartford. It is a shaft seventy-five feet high and ten feet in diameter, surmounted by a statue of Peace. The pedestal has five steps, with statues of History, Victory, Prosperity, and Patriotism, at the four corners.

An equestrian bronze statue of Gen. Burnside, by Launt Thompson, was unveiled at Providence, R. I., July 4.

An equestrian bronze statue of Gen. George G. Meade, by Alexander Milne-Calder, was unveiled in Fairmount Park, Philadelphia, October 18.

A bronze statue of Solomon Juneau, the first white settler, mayor, and postmaster of Milwaukee, Wis., was unveiled in Juneau Park, in that city, July 6.

The bronze statue of Lincoln, by Augustus St. Gaudens, was inaugurated in Chicago. The figure, which is eleven and a half feet high, stands on a pedestal of pink granite, forming a long, curved seat approached by steps. The work cost \$40,000, and the money was bequeathed for the purpose by Eli Bates, of Chicago.

A bronze statue of Gen. Moses Cleveland, the founder of Cleveland, Ohio, by J. G. C. Hamilton, was unveiled in that city in November.

Montreal.—At an exhibition in April of pictures by native and foreign artists, some noteworthy works were shown, among them Jules Bréton's "Communicants," Benjamin-Constant's "After the Victory," Gabriel Max's "Raising of Jairus's Daughter," Henner's "La Source," Bouguereau's "Crown of Flowers," and choice examples by Millet, Corot, Diaz, Dupré, Berne-Bellecour, Leys, Pettie, Boughton, Jacquin, Van Marcke, Kowalski, and other representative artists.

FISHERY QUESTIONS. One of the minor points at issue in the Revolutionary War was the preservation of the ancient fishery franchises. By the terms of the treaty of peace the Americans were accorded the liberty of fishing both on the banks and within the territorial waters of the maritime provinces, the same as was possessed by British subjects; and also of drying and curing their catch on the unoccupied coasts of Nova Scotia, the Magdalen Islands, and Labrador. The Loyalists who settled Nova Scotia, and whom the States refused to compensate for their confiscated property, raised difficulties in regard to the fishery privileges granted to the Americans. In the war of 1812-'15 Great Britain declared the treaty rights to be abro-

gated, and when the treaty of peace was concluded refused to accept the restoration of her former right to navigate the Mississippi in return for the fishery. Thus the United States lost the inshore fishing rights, and the use of the uninhabited coasts for drying and curing fish, and were restricted to the limit of three nautical miles from the nearest shore, which has been accepted in international law.

The Fishery Treaty of 1818.—American vessels were seized, and a diplomatic correspondence was opened by John Quincy Adams, who claimed that the treaty of 1788 had recognized an imprescriptible right. The New Englanders had developed and defended the fisheries, and the acknowledgment of their rights was of the same nature as the partition of the territories in North America by the same treaty. The question was settled by the Convention of 1818, whereby the United States gave up the right claimed of fishing and of curing and drying fish within the maritime boundaries except on the southern shore of Newfoundland, from the Rameau Islands westward to Cape Ray, and thence along the whole western and northern shore to Quirpon Island, on the opposite coast of Labrador from Mount Joly northward through the straits of Belle Isle, and on all the shores of the continent and islands farther north; also on the shores of the Magdalen Islands. The right to dry or cure fish on the coasts of Newfoundland and Labrador described was granted for so long a period as those coasts should remain unsettled, and afterward on agreement with the inhabitants or proprietors of the ground. The rights defined in this treaty were to be permanent and not liable to be denounced or to lapse in case of war. The United States renounced the liberty to take, cure, or dry fish on or within three marine miles of the other coasts, bays, or harbors of the British dominions, "provided, however, that the American fishermen shall be permitted to enter such bays or harbors for the purpose of shelter and of repairing damages therein, of purchasing wood, and of obtaining water, and for no other purpose whatever; but they shall be under such restrictions as may be necessary to prevent their taking, drying, or curing fish therein or in any manner abusing the privileges hereby reserved for them." The American commissioners originally inserted bait among the supplies that might be procured, and then suffered it to be stricken out as being a concession of slight value, as was the fact before the mackerel fishery was developed. The inshore mackerel fishery tempted American fishermen to transgress the three-mile limit, while the provincial authorities began to impose novel penalties for infractions of the treaty, and to interpret its provisions in new ways. In 1841 the British legal authorities broached the headlands question, laying down the doctrine that in all bays the three-mile limit should be taken from a line drawn from headland to headland, and that Ameri-

cans therefore possessed no fishery rights in the bays of Fundy and Chaleur; also that they had not the right to land on the shores of the Magdalen Islands or to navigate the Strait of Canso. The Nova Scotian authorities applied the principles thus enunciated, closing to Americans the herring fishery of the Magdalen Islands, and in 1848 seizing a fishing-schooner in the Bay of Fundy. When Edward Everett, the minister at London, demanded an explanation of this act, the British Government offered to admit Americans to the fisheries of the Bay of Fundy; but, on receiving a protest from Nova Scotia, retracted the concession. The question was discussed by a joint commission in 1853, and on the disagreement of the commissioners was decided by an umpire, who held that bays are not territorial waters when the distance from headland to headland exceeds ten marine miles.

The Reciprocity Treaty of 1854.—The fishery question had become involved with negotiations for reciprocity of trade between Canada and the United States, and was used by the politicians of the British provinces as a means of obtaining commercial concessions. In 1854 the Elgin treaty of reciprocity was concluded. Canadian natural products were admitted free of duty into the United States, and the inshore fishing privileges were granted to Americans, as under the treaty of 1783. The maritime provinces objected to this, but the British Government, anxious to obtain for the produce of Canada an outlet to repair the loss of the exclusive market the colonies had enjoyed in Great Britain before the adoption of free trade, paid no attention to them. The provincials had no reason to complain of the operation of the treaty, for the trade that sprang up between them and the neighboring parts of the United States led to the development of neglected resources, and was followed by prosperity such as they had never before known. Even the fisheries partook of the general improvement, and were hardly injured by American competition. By the treaty of 1854 the bounty system came to an end in the United States. The bounties, which had been granted to fishermen by the general Government since 1789, had been one of the chief causes of the jealous and hostile feelings entertained on the fishery question in the maritime provinces. Their removal was the special compensation to the colonial fishing-industry for the admission of Americans to the territorial fishing-grounds. In consequence of unfriendly acts of the British and Canadians during the civil war, the relations between the Government at Washington and the British Government were so strained that neither party was disposed to renew the treaty, which terminated in 1866. The citizens of the maritime provinces now felt aggrieved because the British ministers had not seen a way to perpetuate the commercial relations that had been to them a source of wealth and prosperity,

The President notified the American fishermen by proclamation of the cessation of their fishery rights in Canadian waters, yet they continued to fish within the three-mile limit, as before. Then a license fee was exacted by the provincial authorities, and American fishermen paid it until it was raised from 50 cents to \$2 a ton. In 1868 and 1870 the Dominion Parliament passed special acts prohibiting foreign fishermen from poaching on the Canadian grounds, and imposing penalties for their infraction.

The Washington Treaty of 1872.—When the provinces of Nova Scotia and New Brunswick were united to Canada, and the fisheries were placed in charge of a Cabinet minister, that official took measures, not only to protect the Canadian fisheries, but to secure for the fishermen of the Dominion advantages over their American competitors in the open-sea fisheries by reviving the illiberal interpretation that, in periods of tension, had been given to the words of the treaty of 1818. The right of buying bait and other supplies in Canadian ports was called in question. The right of landing fish and shipping them in bond over the railroads to the United States was denied, but the suppression of the practice, as well as the exclusion of Americans from the bay fisheries under the old doctrine that the headlands mark the shore, was left in abeyance pending a satisfactory settlement of the whole question. The Canadian authorities had reason to complain of the New England fishermen, who continued to invade the territorial fishing-grounds without regard to the proclamations of their own Government, or the pains and penalties of the Dominion acts. During 1869-'70 the Canadian Government endeavored to police its fisheries with cruisers, which cost nearly \$1,000,000 to maintain. The United States protested at the English court against the exercise of technical rights, such as the prohibition of the purchase of bait. Negotiations were begun for the adjustment of disputes between Great Britain and the United States. The fishery question was complicated with the American claim for damages for the depredations of Confederate cruisers built and fitted out in England. The American Government made an offer of \$1,000,000 for the right of the inshore fisheries in perpetuity, but it was declined. The joint commission, which sat at Washington, agreed that the fisheries of Canada and of the United States, north of 39° north latitude, should be thrown open to the citizens of both countries, and that the United States, besides admitting Canadian fish and fish-oil free of duty, should pay in money the value of the rights granted to American fishermen in Canadian waters, with the deduction of the value of the American fishery rights to Canada. The amount was to be fixed by joint commissioners and an umpire. The treaty went into force in 1873. The fishery commission, composed of Messrs. Galt and Kellogg, represent-

ing Canada and the United States, and M. de la Fosse, the Belgian Minister at Washington, as umpire, met at Halifax in 1877. The Canadian counsel claimed that the actual and prospective value of the mackerel fisheries to the United States was \$1,000,000 per annum; the American case represented that the commission had nothing to do but to calculate their value from the trade returns, and that the remission of \$350,000 of duties, collected annually on fish and oil, was a full equivalent for the Canadian fishery privileges. By its decision, rendered Nov. 23, 1877, the commission fixed the sum due to Canada for the term of treaty at \$5,500,000. There was much surprise at the amount of the award, which was compared with the sum awarded to the United States by the "Alabama" commission. Congress authorized the payment only under the proviso that the President should consider that the good faith of the nation demanded it. Mr. Evarts, the Secretary of State, laid before the British Government statistical evidence, showing that the Canadian fisheries were worth to the United States only \$25,000 per annum, and that the highest computation would not place their value at more than \$125,000, while the duties remitted amounted to \$4,200,000 for the twelve years' period of the treaty. Lord Salisbury insisted that the decree of the commission was final, and the award was duly paid.

Some years after the treaty went into operation, the irritation of the Americans was increased by the Fortune Bay dispute. A mob of Newfoundlanders had attacked American fishermen, and driven them out of the bay, for the reason that they were fishing on Sunday, which was forbidden by the local statutes. Lord Salisbury claimed, when the case was presented to him, that the fishery rights were held subject to all local regulations. Lord Granville, who succeeded him, admitted that unreasonable local laws could not act as a restriction of rights granted by treaty. Damages were paid for the Fortune Bay disturbance, and rules for a close season were made the subject of further negotiations. The treaty of Washington was made for ten years, and either party had the right to abrogate it thereafter on two years' notice. The United States promptly renounced the treaty in 1883, and it expired on July 1, 1885.

Recent Fishery Disputes.—As the termination of the fishery rights occurred in the midst of the fishing season, the British Government agreed to prolong them for six months, while the President promised to recommend to Congress the appointment of a joint commission to consider an arrangement for the extension of trade between the United States and British North America. Congress, which even under the Washington Convention had taxed tinned metal cans, now imposed a duty of one cent a pound on preserved fish for the benefit of the Maine canning-establishments. The Canadian

authorities proceeded in the spring of 1886 to assert the most inconvenient literal construction of the Convention of 1818, to carry into effect the restrictions that in previous disputes had been only threatened, and to enforce the headlands doctrine in an exaggerated form. They were actuated partly by a desire to extort valuable commercial concessions from the United States and partly by resentment against American fishermen, who, in spite of warnings and penalties, continued to take fish within Canadian jurisdiction, driving the Government to the expense of sending cruisers to patrol the coast. There was an unusual temptation to poach on the Dominion fisheries, because in the season that followed the abrogation of the treaty the run of mackerel was good near the shore but very light outside and on the New England coast. The Canadians sometimes have asserted that the New Englanders, by not observing a close season, have exhausted their own fisheries.

The right to purchase bait, or to land and transship fish, or to enter Canadian ports for any purpose other than the ones specifically mentioned in the treaty of 1818, was strictly inhibited. The United States authorities granted licenses to touch and trade to fishing-vessels, and claimed that, for the purposes of purchasing supplies and transshipping cargoes, they were entitled to all the rights secured to trading-vessels under the treaties. But by a decision of the Canadian customs authorities, no vessel has liberty of commercial intercourse that is manned, equipped, or in any way prepared for taking fish.

During the season of 1886 thirty-two vessels were detained by the Canadian officials, some for buying bait, landing fish, or taking on crews, but in the majority of cases for simply breaking the customs rules by anchoring within the port boundaries or landing persons without regular entry at the custom-house. In no instance was a seizure made for fishing within the three-mile limit, and in only two cases for preparing to fish within the forbidden bounds. In evading the customs and fishery regulations, the fishermen of Gloucester and other New England coast towns were aided by their numerous relatives and business associates in the provincial ports. More than one hundred complaints of illegal interference, arrests, and seizures were made to the United States Government against the Canadian authorities. Some of the arrested fishermen were fined, some were released after being detained and sustaining considerable losses, two vessels were condemned to confiscation, and one of these was fitted out at St. Johns as a cruiser.

The American Case.—In providing fishing-vessels with trading-permits the United States authorities desired to bring cases of seizure and arrest before the British admiralty courts, in order that they be may decided according to international law, and not under acts of the Dominion Parliament that are believed to be in

contravention of principles of general application and acceptance between friendly nations. Minister Phelps held that the right to purchase bait and supplies belonged to American vessels by the ordinary usage of international intercourse. The United States Government does not desire to obtain the privilege of the inshore fisheries, which are considered of very little value, since the use of purse-nets has increased the catch of mackerel in the outside waters. The yield of the duty on Canadian fish imports is worth more, and the Americans would be unwilling to remit that duty to secure the inshore fisheries, while the Canadians would desire larger concessions.

Minister Phelps took the ground that the restrictive provisions of the treaty of 1818 were intended to prevent encroachments on the territorial fisheries, and should be interpreted according to their spirit and purpose. Formerly the British Government was guided by the same principle, and never before had American fishermen been denied the privilege of entering the ports and procuring bait or engaging crews. In a dispatch of Lord Kimberley it was formerly held that, while the exclusion of American fishermen, except for purposes of shelter, repairs, or obtaining wood or water, might be warranted by the letter of the treaty of 1818, it would be "an extreme measure, inconsistent with the general policy of the empire." In reference to the seizure of the "David J. Adams" for purchasing bait in the port of Digby and violating the customs act by not reporting to the authorities, Mr. Phelps, in a communication dated June 2, 1886, called attention to the fact that fishing-vessels had been accustomed for forty years to do as this vessel had done. The seizure and confiscation of vessels for such acts he considered a question apart from the interpretation of the treaty. At the time of the seizure of this and other vessels there was no British or colonial law prohibiting or providing any penalty for the purchase of bait. There had never before been a seizure of an American vessel for the purchase of bait or other supplies, but in every previous case vessels condemned were shown to have been guilty of fishing or preparing to fish within the prohibited limit. On the Canadian side the argument was advanced that the catching of bait is fishing, and that, since it is necessarily caught within the three-mile limit, to come within that limit and buy fish is to be responsible for the fishing. The infliction of severe penalties, amounting even to confiscation of vessels and their contents for technical violations of a treaty, even if the Canadian construction were admitted, was considered by the American minister to be a ground for the recovery of damages.

Retaliatory Legislation.—During the Congressional session of 1886, a bill was introduced in the House of Representatives to close American ports to Canadian vessels, and to forbid the entrance of Canadian fresh or salt fish or

other products into the United States by railroad, if the Dominion authorities continued to deny to American fishermen the rights secured to them under the treaty of 1818 and by international law. For this was substituted a bill, which originated in the Senate, giving the President discretionary authority to deny to the vessels of the British Dominions entrance into any or all the ports or waters of the United States, except in cases of distress, and to prohibit the entry of fish or other products from them into the United States.

Diplomatic Arrangements.—In December, 1886, the American minister in London presented to Lord Iddesleigh a proposal for an *ad interim* arrangement, the chief feature of which was to establish a mixed commission in order to "separate the exclusive from the common right of fishing on the coasts and in the adjacent waters of the British North American colonies." The vexed question of the headlands was to be considered as settled by the former decision of a British referee, viz., that bays can only be claimed as territorial waters when the entrance is ten miles wide or less, or from the point where the width does not exceed ten miles. American fishermen were to have the right of purchasing bait and other supplies, and British and American war-vessels were to act as police to prevent poaching on the inshore fisheries. The Canadian Government declined to accept the proposals either as to the headlands or as to provisionally granting commercial privileges to fishing-craft. On March 24, 1887, Lord Salisbury presented a counter-proposition, which was to return for a season to the condition of things as they existed under the Treaty of Washington. The American fishermen were to have the right of buying bait, hiring crews, and shipping fish by railroad, with the privilege of the inshore fisheries, and the Canadians the right of importing fish duty free into the United States. Mr. Bayard had already proposed a mixed commission. After considerable further correspondence, Joseph Chamberlain was sent to Washington in the autumn to endeavor to effect a settlement. The conference began in November, and was continued through December without accomplishing much toward reconciling American and Canadian views. A *résumé* of the diplomatic history of the North Atlantic fisheries from their first discovery is given in "The Fishery Question," by Charles Isham (New York, 1887).

French Fishery Rights.—The French treaty with England in 1783 secured to France fishery rights nearly identical with those accorded to the United States. A large part of the French rights exist at the present day. There has been as much or more hostility to French fishermen in the colonies as was ever felt toward Americans. The right, not only to fish in their waters but to land on their coasts for drying and curing fish, is felt to be a grievance by the Newfoundlanders—the more so be-

cause the French have the advantage of a bounty of over \$2 a quintal from their Government. The British Government has found it necessary to veto various acts of the colonial Legislature designed to hamper the French fishermen. There were certain open questions between the French and British Governments which, after an intermittent controversy extending over many years, were settled by a new convention on Nov. 14, 1885, which was agreed to notwithstanding its being unacceptable to the colonists. The English Government has not been guided by the same rules in dealing with the French as have governed its recent course toward the United States. In reference to an act passed by the Legislative Council and Assembly of Newfoundland, in regard to the sale of bait, the home Government declared that, in the negotiations that had taken place since 1857, a provision for the sale of bait had always been contemplated.

North Pacific Fishery Dispute.—In 1868, Congress placed Alaska under the jurisdiction of the Treasury Department, and in the same act forbade the killing, except by leave of the department, of any mink, marten, sable, or fur-seal, or other fur-bearing animal within the limits of Alaska Territory, or in the waters thereof, under penalty of fine or imprisonment or both, and the forfeiture of any vessel found in violation of the act. The Pribylov islands of St. Paul and St. George, which are the breeding-grounds of the seal, were leased to the Alaska Commercial Company, of San Francisco, at a rental of \$60,000 a year, with \$2 royalty for every sealskin shipped. The company is allowed to kill none but young male seals, and only during certain months, and is restricted to the number of 100,000 in any one year, while the use of firearms, or of any means tending to drive the seals away, is prohibited. These stringent regulations are designed for the preservation of the seals. They have hitherto been more strictly enforced than similar regulations were under the Russian rule, and, consequently, the seals, which had begun to diminish, have become more numerous since the monopoly of the Alaska Company began in 1870. The lack of protective laws has resulted in the disappearance of the fur-bearing seal, which once abounded in the Kerguelen group and other islands of the southern hemisphere, in the Falkland Islands, and on the coasts and islands of South America, from all their known habitats excepting these Alaskan isles. The Indians of the Pribylov Islands are allowed to kill and sell a certain number of seals for their own benefit. The Alaska Company has the monopoly of the fur-trade of Alaska, as well as of the seal-fishery of the islands, and, since other fur-animals besides seals vanish rapidly before the destructive agencies of white men, many obstacles are placed in the way of opening Alaska to traders, settlers, miners, and hunters. With the increase of population on the

western coast of North America, the difficulty of preserving the seal-fisheries from destruction becomes greater. Schooners and steamers from British Columbia hover around the seal islands, and find ways of obtaining a share in the profitable seal-trade that the American company can not prevent. American vessels also engage in the business, which may be the main object of the trip, or may be pursued in connection with fishing and walrus-hunting. The seal-hunters have been accustomed to shoot the seals in the waters adjacent to the breeding-places, but this method of obtaining them, though exceedingly destructive, would not be profitable by itself, for only a small proportion of the animals hit are killed instantly and secured while floating on the water. It was more advantageous to land on the islands and shoot the seals on the rocks. In 1876 the United States sent cruisers to put a stop to such depredations, and since then a more or less effective guard has been maintained against poachers on the islands. It has been much more difficult to prevent an illicit traffic in sealskins with the Indians, who stalk and harpoon the seals on the islands, and take the skins out to sea in their boats, exchanging them for money or whisky with the vessels engaged in the traffic. In order to prevent the destructive practices that threatened the extermination of the seals, the Treasury Department in 1886 attempted to enforce a doctrine that it had not previously asserted, viz., that Behring Sea was a *mare clausum*, and that the United States had jurisdiction over one half of it. This right was specifically granted in the treaty ceding Alaska to the United States, yet in 1822, when Russia attempted to claim sovereignty over the sea, the United States, as well as Great Britain, raised a strong protest against the doctrine that a nation could claim territorial jurisdiction over a sea having an entrance a thousand miles wide. The commander of the revenue cutter "Corwin" was instructed to seize all sealers found to the east of a line drawn from between the Diomed Islands in Behring strait in a south-westerly direction to a point equidistant from Copper and Otter islands in the Aleutian group. In 1886 the British schooners "Carolina," "Onward," and "Thornton" were captured and taken to Sitka. A trial was held, the vessels were condemned, the masters fined, and the seal-skins on board confiscated and sent to San Francisco. The vessels were not taken within the three-mile limit. Several American schooners were captured and confiscated. Judge Dawson told the captain of the "Thornton," in sentencing him to a fine of \$500 and imprisonment, that it was little better than piracy to go into the waters of another nation and interfere with its industries as he and the other prisoners were doing. The British Government made a demand for the release of the prisoners, and presented a claim of about \$160,000 for loss of property and

damages for loss of time and probable profits, and for illegal arrest and imprisonment. The first demand for information was made on September 21, and the claim for redress was presented on Oct. 21, 1886. On Jan. 26, 1887, by direction of the President, Attorney-General Garland sent a dispatch to the authorities in Alaska ordering the unconditional release of the imprisoned men, and the surrender of the vessels and other property. The order was not executed, and it was not till September 20 that a letter was received from the United States Marshal at Sitka, explaining that the telegram was supposed to be a fraudulent dispatch. On October 12 the Attorney-General sent another telegram, ordering the vessels to be released, which directions were repeated in a letter dated October 15. Meanwhile, the officials of the Treasury Department had not revoked their instructions, but had sent out the steamer "Rush" with the same orders, which during the summer of 1887 seized the British vessels "Dolphin," "Annie Beck," "W. P. Saywood," "Grace," "Alfred Adams," besides seven American sealers, at distances of from thirty to seventy miles from land.

FLORIDA. State Government.—The following were the State officers during the year: Governor, Edward A. Perry, Democrat; Lieutenant-Governor, Milton H. Mabry; Secretary of State, John L. Crawford; Comptroller, William D. Barnes; Treasurer, Edward S. Crill; Attorney-General, Charles M. Cooper; Superintendent of Public Instruction, Albert J. Russell; Commissioner of Lands and Immigration, Charles L. Mitchell; Chief-Justice of the Supreme Court, George G. McWhorter, succeeded by A. E. Maxwell; Associate Justices, George P. Raney and R. B. Van Valkenburgh.

Legislative Session.—The Legislature assembled on April 5, and continued in session sixty days. Being the first that had met since the adoption of the new Constitution in 1886, it had important work to perform in revising and enlarging the laws to harmonize with or give effect to that instrument. An unusually large amount of legislation was secured, in spite of the fact that much time was taken from the session by a prolonged contest in the Democratic caucus over the succession to United States Senator O. W. Jones. Ex-Gov. Bloxham and Gov. Perry were the leading candidates through nearly 100 ballots, when, upon their withdrawal, Samuel Pasco, Speaker of the House, was chosen as a compromise candidate. The Legislature in joint session elected him Senator by a vote of 84 to 17 for F. S. Goodrich, Republican. As the term of Senator Jones expired in March, before the meeting of the Legislature, the Governor had previously appointed Gen. J. J. Finley to hold the office in the interim.

The legislation adopted embraces a railroad commission act, an act revising the entire method of assessing and collecting State taxes, a new appointment of members of the Legislature according to the census of 1885, and a State militia

bill. The last measure provides for the organization of not more than 10 companies of volunteers, to be called the Florida State troops, establishes armories for them, and prescribes their equipment and discipline. Before the passage of this act the State militia was disorganized and almost defunct. New charters were granted to the cities of Jacksonville, Tampa, Fernandina, Palatka, and De Land. The St. John's Conference College (Methodist), and De Land University, in the city of De Land, were incorporated. The regular appropriation for the year 1887 was \$470,293; for 1888, \$405,900; and for the first quarter of 1889, \$51,400. Other acts of the session were as follow:

Appropriating \$10,000 to pay the debt of the East Florida Seminary, and \$1,000 for each of the next two years for its support.

To repeal all laws or parts of laws that impose a license tax upon commercial agents or "drummers."

To supply deficiencies for the years 1885 and 1886, viz.: for expenses of the Constitutional Convention of 1885, \$30,500; for expenses of the census of 1885, \$6,000; for contingent expenses of the Supreme Court, \$2,600; for jurors and witnesses during 1886 and previous years, \$76,000.

To provide, in accordance with the new Constitution, that on petition of one fourth of the electors of any county an election may be had, not oftener than once in two years, to decide whether the sale of intoxicating liquors shall be prohibited therein, and regulating the procedure at such elections.

Fixing the date of elections, the officers to be voted for, and the procedure at such elections under the new Constitution. [By this act a complete set of State officers—legislative, executive, and judicial—are to be chosen on the Tuesday after the first Monday of November, 1888, and a general election is to be held every two years thereafter. Members of the Lower House of the Legislature are elected for two years, Justices of the Supreme Court for six years, one of them retiring every two years; all other State officers hold their places for four years.]

Requiring all railroads in the State to be fenced.

Prohibiting the consolidation of parallel or competing lines of railway in the State.

Giving mechanics, artisans, laborers, and persons furnishing materials, a lien on the property constructed, or upon the property of the contractor for such work or materials.

Forbidding the purchase of seed cotton at night.

To protect the fresh-water fisheries of the State.

Fixing the age of consent in females at 17 years.

To suppress gambling-houses and gambling.

The following new counties were created: Osceola, from portions of Orange and Brevard; Lee, out of Monroe; De Soto, out of Manatee; Lake, from portions of Sumter and Orange; Pasco and Citrus counties, from portions of Hernando.

To authorize the Savannah, Florida, and Western Railway Company to construct and operate a railroad from Tallahassee, and also a railroad from Monticello to the Georgia and Florida State line.

Granting to certain persons the right to dig and mine in the beds of the navigable streams and waters for phosphate rocks and deposits.

To incorporate the Florida Normal School and Business Institute at White Springs.

For the incorporation and regulation of building and loan associations.

To provide for the incorporation of colleges, academies, and other institutions of learning.

To provide for the appointment of a board of examiners, and to regulate the practice of dentistry.

Amending the procedure in taking lands of private individuals or corporations for the use of railroads or canals.

Providing that the county judges shall issue marriage licenses, and that these shall be recorded.

To prescribe the rules of pleading and practice of the county courts of the several counties of this State in civil and criminal cases.

Forbidding free passes or special rates for members of the Legislature or any salaried State officer.

Finances.—The bonded debt of the State, at the beginning of the year, consisted of \$350,000 seven-per cent. bonds of 1871, and \$925,000 six-per cent. bonds of 1873, making a total indebtedness of \$1,275,000. Of these bonds, \$218,800 are held in the sinking fund of the State, and \$625,500 by the various educational funds, leaving only \$430,700 in the hands of individuals. No provision being made for refunding them before maturity, the State is unable to take advantage of the lower rates of interest now prevailing. During 1886 the total State expenditures were \$407,806, and the income from State tax and licenses \$423,679, of which \$296,323 was the State tax. In 1887 the same tax was \$328,088, an increase caused by a law raising the rate from 4 to 4½ mills. This act was rendered necessary by a provision of the new Constitution, throwing upon the State the cost and expenses of criminal prosecutions, which were heretofore paid by the counties, and which amount to about \$100,000 annually. At the same time, the county tax was reduced one mill, making a general reduction of taxes to the people of half a mill. The total county tax in 1886 was \$662,087; in 1887, \$666,879.

Statistics.—The population of the State, now over 350,000, is increasing more rapidly than at any previous period. In two years from March, 1885, the city of Pensacola gained 8,684 people, increasing her whole population to 14,220. One city, Gainesville, containing 5,038 people, has gained 1,200 in a year.

The following figures are taken from the assessment rolls of 1886: number of acres of land assessed, 19,888,091; number improved and cultivated, 709,950; value of city or town lots with improvements, \$16,814,568; value of other real property, \$41,159,728; number of horses and mules, 40,217; cattle, 464,454; sheep and goats, 111,098; swine, 177,187; value of all animals, \$5,466,243; value of all personal property, \$18,486,045; total valuation of real and personal property, \$76,611,409.

Charities and Prisons.—The superintendent of the State Insane Asylum reports an increase of patients for the two years ending Jan. 1, 1887, from 157 to 192. An additional three-story brick building has been erected. There is a large farm connected with the institution in successful operation. The total cost to the State for the support of its lunatics in 1886 was \$44,954.

At the State Blind and Deaf Mute Institute, 15 pupils were in attendance at the beginning of the year.

The convicts are hired out and cared for, without expense to the State, under a four years' contract ending in December, 1889, with

an individual who employs them in the manufacture of naval stores. Their number has increased from 197 in 1885 to 236 in 1886, and 313 in 1887. The health of the prisoners and their treatment by the lessee are satisfactory.

Education.—The State superintendent reports for 1886 an increased organization and efficiency in the public schools, and a hopeful prospect. The following table shows their growth and condition as compared with 1885:

ITEMS.	1885.	1886.
Number of schools	1,734	1,919
Number of pupils	67,327	79,637
Number of male teachers	991	1,013
Number of female teachers	793	835
Average daily attendance	45,850	44,313

Estimating the population at 350,000, Florida has a school for every 175 inhabitants. She expends \$5 for every child of school age and \$7.37 for every average attendant upon the schools. During 1885 and 1886 teachers' institutes were held in twenty-eight counties, bringing under their instruction 795 teachers. Normal departments for instruction of white teachers were conducted in the West and East Florida seminaries, and normal schools for colored teachers organized and conducted at Tallahassee and Gainesville, and continued for two months, giving 275 attendants the benefit of training for their work as educators. These short normal courses were the only instruction the State could offer for the training of teachers, until the Legislature this year provided for the erection of buildings and the maintenance of regularly equipped normal schools at De Funiak Springs and at Tallahassee, the former for white and the latter for colored pupils. The higher institutions, East and West Florida seminaries, and the State Agricultural College are making satisfactory progress.

Railroads.—The Governor, in his message to the Legislature, says: "The two years last past have witnessed the building and equipment of more than 500 miles of new, and the renovation of more than 500 miles of almost worse than useless old road, thus substantially adding to first-class railroad facilities fully 1,000 miles. In no other equal time in the history of our State has such progress been made." The total number of miles of road assessed in 1886 was 1,701, with a total assessment of railroad property amounting to \$11,872,016. During 1887 the Legislature granted letters of incorporation to nine new companies, and probably over 150 miles of road were constructed. The assessed value of railroad property for this year rose to \$12,752,331, a gain of \$1,380,315 over 1886.

By the railroad law passed this year, the duty of supervision was given into the hands of a board of three commissioners, appointed by the Governor, and holding office four years. They have power to make and establish reasonable rates of fare for passengers and freight, and to make any other reasonable regulations

applicable to all the railroads of the State. They can require railroads to produce books and papers for inspection, and they may examine such, as well as all agents or employes of the roads. Their decisions may be appealed from. The Governor appointed Ex-Chief-Justice McWhorter, Ex-Circuit Judge Enoch J. Vause, and William Himes as members of the board.

The Okeechobee Drainage.—By a contract made in 1881 between the trustees of the State Internal Improvement Fund and the Atlantic and Gulf Canal and Okeechobee Land Company, it was agreed that the company might drain and reclaim all the overflowed lands in the vicinity of or submerged by Lake Okeechobee or the Kissimmee river, or their tributaries or outlets, by permanently lowering the waters of the lake; and of the lands of the State so reclaimed the company shall be entitled to one half. In pursuance of this agreement the company constructed canals and other works upon a large scale, and by 1884 claimed to have drained a large area. In that year agents of the State sent to inspect the work reported that nearly 2,500,000 acres had been permanently restored to cultivation. The trustees, accordingly, conveyed to the company 1,174,942 acres as its share. But a committee appointed by the Legislature of 1885 made a report at the session of this year which denies the conclusions arrived at by the trustees, and represents that only 80,000 acres have been actually reclaimed. This report, implying that the company had unfairly obtained title to nearly all of its land, was the subject of extended discussion, and resulted in the passage of a bill giving the trustees power to bring suits to recover the lands so alienated or to enter into any compromise with the company that should seem advisable.

Minerals.—A report upon the geology and mineralogy of the State was made to the Legislature of this year, from which the following facts are gathered: No deposits of the precious metals and but few of the lower metals except iron can be found. The iron-ore is not the best, being of the limonite variety. It is found in the largest quantities in Jackson County, but no attempt has yet been made to utilize it. Rich deposits of phosphates exist in several counties, notably Wakulla, Alachua, Marion, Hillsborough, and Manatee. These are as rich in phosphoric acid as the well-known rocks on the Cooper and Ashley rivers in South Carolina. The largest deposit, in Wakulla County, is a triple phosphate of lime, iron, and alumina. Limestone is found in considerable quantities throughout the State, but is generally too siliceous to produce good lime. Clay suitable for making good brick exists in all parts of the State, the best quality being in Escambia County. A considerable deposit of soft brown or lignite coal has recently been discovered in Santa Rosa County, near the west bank of Blackwater river. The vein lies

eight feet below the surface and has an average depth of about thirty inches. There is available building-stone, but none of marked value.

Coast Defense.—In response to a call issued by the Executive Committee of the Coast Defense Association of the coast cities of the South, a convention of delegates from the Southern Atlantic and Gulf States met at De Funiak Springs on February 8 to organize a movement for the better protection of the Southern seaboard. The following memorial to Congress was adopted:

In view of the defenseless condition of the harbors of the Atlantic Gulf States as well as the Pacific and Lake States, we most respectfully memorialize Congress of the United States to take such steps and enact such laws as are necessary to put our coasts in a proper state of defense by building such fortifications as the engineering skill of our army officers may determine to be the best and most important, and, further, by supplying our navy with such ships and armament as modern science renders necessary, and,

Whereas, There is no arsenal south of the Ohio river; and, *whereas*, steel-making ores abound in Tennessee, Alabama, Georgia, and Virginia, as well as other materials for the manufacture of all appliances of war, we recommend to Congress the location of a manufacturing arsenal at some point remote from the sea-board and convenient to the steel-ore belts of the South; and, *whereas*, in our opinion, our navy must be our chief means of defensive and offensive warfare, we recommend that a navy-yard for the construction and armament of the most improved modern ships of war be established in some proper Southern port, believing that, in case of war, our means of building ships and manufacturing the appliances of war should not be confined to one place, but should be widely separated, so that the loss of one would not be the loss of all.

Later in the same month a meeting of the Southern States Forestry Congress was held at the same place, and measures were taken toward insuring the preservation of the timber wealth of the South.

FRANCE, a republic in western Europe. The republican form of government was proclaimed Sept. 4, 1870. Under the law of Feb. 25, 1875, the legislative power is exercised by two chambers. The Senate consists of 800 members, elected by the departments and the colonies in accordance with a special law adopted Dec. 9, 1884. The Chamber of Deputies consists of 584 deputies, or one to every 70,000 inhabitants, elected by universal suffrage for the term of four years. The list of deputies for each department is chosen by all the voters of the department on a single ticket. The President of the republic is elected for seven years by a majority of votes in a Congress or National Assembly, consisting of the Senate and the Chamber of Deputies united. While the ministers are responsible to the Chambers for the general policy of the Government, the President is responsible only on impeachment for high treason.

The President of the republic in the beginning of 1887 was François P. Jules Grévy, born Aug. 15, 1813, who was President of the Chamber of Deputies in 1876-'79, and was elected to the chief magistracy in January,

1879, and re-elected in December, 1885. On his resignation the National Assembly elected as his successor on Dec. 3, 1887, M. Sadi-Carnot, formerly Minister of Finance (see **CARNOT**, **MARIE FRANÇOIS SADI**).

Area and Population.—The table on next page gives the area, in square kilometres, and the population of the eighty-six departments of France and the territory of Belfort, according to the census taken on May 30, 1886.

The increase of population between 1881 and 1886, amounting to 766,260, did not extend over all the departments. In thirty-two there was a decrease, the greatest being in Orne, which had 8,878 more inhabitants in 1881 than in 1886.

The population of the cities having over 100,000 inhabitants in 1886 was as follows:

CITIES.	Population.	CITIES.	Population.
Paris.....	2,344,550	Nantes.....	127,489
Lyons.....	401,880	St. Etienne.....	117,575
Marseilles.....	376,148	Havre.....	112,074
Bordeaux.....	240,592	Rouen.....	107,163
Lille.....	188,273	Roubaix.....	100,299
Toulouse.....	147,617		

The number of marriages in 1886 was 283,193, as compared with 283,170 in 1885; the number of births, 956,863, as compared with 966,819; the number of deaths, 908,803, as compared with 880,855; the excess of births, 52,560, as compared with 85,464. The number of emigrants in 1884 was 6,100, of whom 2,564 went to the Argentine Republic, 2,485 to the United States, 386 to Brazil, 333 to Chili, and small numbers to Mexico, Cuba, and other countries.

Commerce.—The value of the special imports in 1885 was 4,088,401,000 francs, and of the special exports, 3,088,145,000 francs. The imports of bullion and specie amounted to 480,000,000 francs, and the exports to 339,000,000 francs. The returns of the special commerce for 1886 make the total value of merchandise imports 4,234,863,000 francs, and the exports 3,800,280,000 francs. The imports of cereals in 1886 were valued at 297,622,000 francs, and the exports at 52,828,000 francs; imports of wines and liquors, 557,432,000 francs, exports, 350,076,000 francs; imports of sugar, coffee, etc., 192,835,000 francs, of tobacco, 33,569,000 francs, of vegetables, etc., 342,388,000 francs, of live animals and animal food products, 339,809,000 francs; exports, 252,004,000 francs; total imports of articles of consumption, 1,763,655,000 francs; exports, 822,669,000 francs. The imports of fuel were 143,014,000 francs, of hides, etc., 242,286,000 francs, exports, 198,228,000 francs; imports of textile materials, 869,045,000 francs, exports, 806,128,000 francs; imports of timber, 167,728,000 francs; total imports of raw materials, 1,583,640,000 francs; total exports, 578,107,000 francs. The imports of textile fabrics were 216,039,000 francs, exports, 907,678,000 francs; the exports of pottery and glass, 84,655,000 francs; imports of machinery and metal manufactures, 77,721,000

franca, exports, 136,635,000 francs; exports of leather manufactures, 141,118,000 francs; imports of textile yarns, 71,288,000 francs, exports, 45,208,000 francs; exports of jewelry and art objects, 149,032,000 francs; total imports of manufactured articles, 484,871,000 francs; total exports, 1,517,106,000. The imports of drugs, chemicals, and coloring matters were 188,376,000 francs, exports, 100,756,000 francs; imports of gums, fats, and oils, 117,937,000 francs, exports, 68,357,000 francs; total imports of miscellaneous products, 402,223,000 francs; total exports, 382,848,000 francs. The imports of precious metals in 1886 amounted to 448,518,000 francs, and the exports to 388,262,000 francs.

Navigation.—The number of vessels entered at French ports during 1886 was 27,377, of 12,419,848 tons, of which 7,971, of 4,385,258 tons, sailed under the French flag. The number cleared was 21,878; tonnage, 9,024,902.

The commercial navy consisted on Jan. 1, 1885, of 14,414 sailing-vessels, of 522,759 tons, and 988 steamers, of 1,083,831 tons.

Railroads.—There were in operation on Dec. 31, 1886, 18,390 miles of railroad, besides 1,165 miles of local roads.

The Post-Office and Telegraphs.—The number of letters and postal-cards transmitted in the mails during 1885 was 679,145,988; circulars, etc., 433,024,178; newspapers, 418,981,838. The receipts of the postal and telegraph service in 1885 were 166,578,658 francs; the expenses, 184,424,235 francs. The length of the state telegraph lines in 1885 was 51,800 miles; the length of wires, 161,800 miles; the number of messages during the year 32,540,780.

Finance.—The financial accounts of 1870 and 1871 showed a surplus. Since then there has been a deficit every year. Ministries have been repeatedly overturned on financial questions, yet the final accounts are never made to balance, though the budget has doubled since 1869. The increased expenditure has been covered chiefly by new indirect taxes, such as customs duties, stamps, the sugar-tax, and duties on wine, salt, and railroad transportation. The accumulated deficits from 1870 to 1885 amount to 481,352,000 francs. Taking account only of the ordinary and normal receipts and expenditures for the same period, it is calculated that there has been really a surplus of receipts amounting to 81,941,802 francs.

The budget for 1887, as adopted on Feb. 17, 1887, makes the total ordinary receipts 2,957,994,090 francs, and the expenditures 2,957,388,964. The expenditure of the Ministry of War is set down as 555,984,529 francs; of the Ministry of Marine and the Colonies, 229,701,863 francs; of the Ministry of Public Instruction, 145,303,435 francs; of the Ministry of Public Works, 121,156,259 francs; the cost of collection, 331,275,175 francs; the expenditure on account of the public debt, 1,286,872,814 francs. The revenue from direct taxes is taken as 440,270,690 francs; from indirect

taxes, 1,802,850,300 francs; from domains and forests, 47,560,880 francs; from monopolies and industrial institutions, 580,447,925 francs. The extraordinary expenditures are 191,000,000 francs for the army, 30,705,000 for the navy, and 54,704,400 for public works. They are provided for by loans. The budget of receipts and expenses from special resources balances with the sum of 467,123,452 francs. Apart from the other accounts is that of special services, viz., the mint, printing establishment, state railroads, and the invalid fund, which shows 79,124,758 francs of expenditures, balanced by the receipts.

The capitalized value of the consolidated debt amounted in 1887 to 21,449,066,123 francs, paying 769,908,088 francs of *rente*. The total debt of the country was calculated by M. Tirard in 1884 at 35,874,736,554 francs. The conversion of the old 4½-per-cent. *rentes*, of the capital amount of 840,000,000 francs, into 3 per cents., was authorized by the Chambers in November, and, notwithstanding the presidential crisis, was successfully effected on November 24.

The Army.—The law of July 25, 1887, increased the number of regiments of the line from 144 to 162, and in the existing regiments suppressed a battalion in each in order to form complementary cadres. The same law authorized the formation of four regiments of dragoons, one of chasseurs, six of hussars, and two of chasseurs d'Afrique. The new infantry regiments are destined to garrison the principal fortresses. The peace effective of the French army is as follows: Infantry, 12,200 officers and 290,000 rank and file; total, 302,200, with 6,400 horses; cavalry, 3,850 officers and 73,000 men; total, 76,850, with 60,000 horses; artillery, 3,000 officers and 64,600 men; total, 67,600, with 29,600 horses; engineers, 880 officers and 10,300 men; total, 11,180, with 1,000 horses; military train, 408 officers and 7,720 men; total, 8,128, with 7,672 horses; general staff, 3 marshals, 100 generals of division, 200 generals of brigade, and 33 generals of the *cadres* and reserve; total, 336, with 392 servants and 2,100 horses; employés of the general staff of officers' rank, 3,678; administrative troops, military schools, etc., 18,474, with 2,470 horses; gendarmerie, 788 officers and 25,024 men; total, 25,812, with 13,152 horses. Total active army, 25,532 officers and 489,118 men; together, 514,650, with 122,394 horses.

The territorial army numbers 87,000 officers and 579,000 men. The war effective is estimated at 3,759,000 men, of whom 1,887,000 belong to the nine classes of the active army and its reserve, 903,000 to the five classes of the territorial army, and 969,000 to the reserve of that army.

The strength of the active army, as provided for in the budget of 1887, was 523,693 men, including the sick and furloughed, and 130,920 horses. Of these 24,812 men belonged to the

gendarmerie and Garde Républicaine, and 52,708 were quartered in Algeria. All soldiers in the regular army who can read and write and are properly trained in military exercises may be sent on indefinite furloughs at the end of a year.

France is divided into eighteen military regions, each under the command of a general of division, and subdivided into districts, each under a general of brigade. There is a separate service for the strong places. Paris is fortified as a central place of arms. The first-class frontier fortresses are Lille, Dunkirk, Arras, and Douai, on the Belgian frontier; Belfort, Verdun, and Briçon, on the German; Lyons, Grenoble, and Besançon, on the Italian; the naval harbor of Toulon, on the Mediterranean coast; Perpignan and Bayonne, on the Spanish frontier; Rochefort, Lorient, and Brest, on the Atlantic coast; and Cherbourg, on the Channel coast.

The Navy.—The French navy consists of 410 vessels. There are 52 armor-clads, of which 34 are line-of-battle ships, 21 of the first and 21 of the second class, and 18 are designed for coast defense, comprising 12 coast-guards, 1 gunboat, and 5 floating batteries. The number of cruisers of the first, second, and third classes is 54. There are 22 gunboats of the first and second classes, 57 sloop gunboats, and 64 torpedo-boats. The vessels on the stocks include 9 first-class ironclads, 7 armored gunboats, 4 cruisers, 8 torpedo avisos, and 13 torpedo-boats.

The Cabinet Ministry.—After the defeat of the Cabinet of M. Freycinet in December, 1886, on the question of abolishing the sub-prefectures, it was reconstituted by the Minister of Public Instruction in the defeated Cabinet, MM. de Freycinet, Sadi-Carnot, and one or two others going out, and was composed at the beginning of 1887 as follows: President of the Council and Minister of the Interior, René Goblet; Minister of Foreign Affairs, Léopold Émile Flourens; Minister of Finance, H. Albert Dauphin; Minister of Public Instruction, Pierre Eugène Marcellin Berthelot; Minister of Justice, Jean Marie Ferdinand Sarrien; Minister of War, General Boulanger; Minister of Marine and the Colonies, Admiral Aube; Minister of Posts and Telegraphs, Étienne Armand Félix Granet; Minister of Commerce, Edouard Étienne Antoine Simon Lockroy; Minister of Public Works, Edouard B. P. Millaud; Minister of Agriculture, Jean Paul Denelle.

The programme of the new ministry was to balance the budget by reducing the redemption of the debt and to abolish about one sixth of the sub-prefectures. Special military credits of 86,000,000 francs for the new rifles and 30,000,000 francs for the navy were voted without discussion. The Radicals called on the Government to establish as the sole tax a progressive income-tax, but the proposal for a progressive tax was negatived by a vote of 221 to 110, while a resolution for an income tax was agreed

to. The Minister of Justice proposed one in the shape of a duty on houses levied on the occupiers, who should pay a percentage of their rent, to be fixed annually according to the financial exigencies of the Government. This scheme, like most of the Government proposals, met with little favor. The Radicals and Reactionaries who demanded the dismissal of the sub-prefects would not accept the Government proposal merely to reduce the number from 860 to 296, and the question was left in abeyance. The Chamber agreed to bills raising the duty on wheat from 3 francs to 5 francs, with a corresponding increase on other cereals and fl our, and the duties on oxen from 25 francs to 38 francs, on cows from 12 francs to 20 francs, on sheep from 8 francs to 5 francs, and on meat from 7 francs to 12 francs per hundred kilos. The last item affects only the United States, since with other countries there are treaties fixing the meat duty at 3 francs. A surtax of 10 francs per 1,000 kilos on sugar was approved. The sale of the crown jewels realized 6,684,000 francs.

The Cabinet had no element of strength, but the question of its displacement was a matter of anxiety on account of the military situation. Gen. Boulanger's efforts to increase the efficiency of the army had been followed by Prince Bismarck's alarming speeches in the Reichstag and the increase of the German army with the sanction of the nation, attested by a general election. A grave situation was thus created, which had passed beyond the ability of statesmen to control. The German authorities forbade the export of horses, called out reservists, and were engaged in military preparations on the French frontier that might portend an invasion in the spring. Gen. Boulanger had constructed barracks, and was planning an experimental mobilization on the German frontier. To forego this test of the army organization, or to dismiss the reorganizer of the military resources of the republic would seem an evidence of fear, and might even precipitate instead of averting an attack. The Radicals, supported by the Monarchists, would not assent to the budget presented by the Minister of Finance, and the budget committee called for a reduction of from 2 to 3 per cent. in each department. The ministry could not see its way to a retrenchment of more than 26,000,000 francs without disorganizing the services. The vote, nominally on the retrenchments demanded by the Radicals, was determined by the military situation, yet it was very uncertain whether, if the Goblet Cabinet were defeated, it would not give place to a Freycinet-Boulanger Cabinet that would probably lead to war. The result of the vote, which was taken on May 17, indicated the perplexity of men's minds, but resulted in a defeat of the Government by a majority of 275, composed of 165 Reactionaries and 110 Republicans, augmented by M. Ferry and 57 other Moderates, less than half of the Extreme Left voting with M. Clémenceau,

while 40, with 60 Radicals and 150 Moderates and Independents, voted to sustain the ministry. M. de Freycinet declined to form a new ministry, while M. Grévy objected firmly to sending for M. Clémenceau. M. Duclero, M. Rouvier, and others were summoned to the Élysée, and finally M. Floquet, President of the Chamber and a member of the Radical Left, undertook the task, after first declining. A war policy could not be thought of under the premiership of a man who once shouted for Poland in the presence of the Czar. The Opportunists would promise him no support; and, after others had tried and failed, M. Rouvier, who was Minister of Commerce under Gambetta and Ferry, succeeded in forming a cabinet from which—in view of the fact that M. Goblet, who was a Radical, had been overthrown by a part of the Opportunist party joining with the Extremists and the Monarchists—all Radical elements were excluded.

The Rouvier Cabinet.—The new ministry, constituted on May 30, was composed as follows: President of the Council and Minister of Finance and of Posts and Telegraphs, Maurice Rouvier; Minister of the Interior and of Worship, Clément Armand Fallières; Minister of Education, M. Spuller; Minister of Foreign Affairs, L. E. Flourens; Minister of Justice, M. Bousquet; Minister of Public Works, M. de Hérédia; Minister of Agriculture, M. Barbe; Minister of Commerce, M. Dautresne. The portfolio of War was accepted by Gen. Saussier, commandant of Paris, but on his insisting on the withdrawal of the military bill, Gen. Feron was appointed in his place.

The phrase with which the new ministry introduced itself was "a cabinet of Republican concentration." In the ministerial declaration "all Republicans, all patriots," were invited to help in the work of reconciliation. M. Goblet had offended the Extremists by asserting his independence of them, and invoking support from the moderate section of the Right. During the crisis the Monarchists had received a rebuke from the Comte de Paris for their readiness to combine with Radicals and Socialists for the purpose of upsetting cabinets. The Extremists, who had no representation in the new Cabinet, pressed M. Rouvier to say whether he intended to govern with a Republican majority. This he affirmed, and in the vote, on a motion of want of confidence, he received a majority of ten or twelve among the Republicans, and, with the Right, a majority of 285 against 139 in the Chamber. He promised a reduction of 60,000,000 francs in the expenditure, and expected to make existing taxes suffice by making collections more stringent and repressing fraud.

The Military Bill.—The military organization bill, which Gen. Boulanger had prepared, was adopted by the new ministry, and discussion on it began on June 5. Seminarists, students, and teachers, previously exempt from military conscription, were to be compelled to undergo

training, and made liable to serve as reservists. The one-year volunteer system was to be abolished, and a universal obligatory three-year service established, instead of the period of five years. All the Republicans voted in favor of abolishing the exemption of seminarists. The one-year volunteer system, which was adopted after the war of 1870 as a mitigation of the abolition of substitution and in imitation of Germany, permits young men of the upper and middle classes to serve only twelve months, during which they enjoy a privileged position in the army on passing a literary examination and paying 1,000 francs. Under the proposed conscription law, young men, who are liable from the age of twenty, may have the date of their entrance into the army postponed for a year, and the postponement renewed for another year, on proving that their studies, or apprenticeship, or agricultural or commercial occupations would be interrupted to their prejudice. The period may be extended to three or four years in the case of students of the universities and certain technical schools and seminarists. The same privilege was extended to the Catholic colleges that were established in 1875 in opposition to the University. These exceptions, which were adopted during the discussion in spite of the objections of the Radicals, were the only compromise that the upholders of a democratic army system would offer to the advocates of volunteering.

It was originally intended to furlough a considerable part of the conscripts at the end of two years, but the general three-years' service was agreed to at the request of Gen. Ferron, who showed that the aggregate force under the colors would then be 480,000, or only 66,000 more than under the old law, and the extra expense of keeping the whole yearly contingent with the colors only 8,000,000 francs per annum. At this point M. Laisant, the originator of the measure, resigned his post as reporter of the committee, and the bill was abandoned by its friends, who thus put off a reform for which the democracy of France have been clamoring for twelve years, rather than sacrifice a part of the relief from the blood-tax that the working-people would gain. The Chambers authorized the creation of four new cavalry regiments and eighteen infantry regiments, and voted 7,000,000 francs for the experimental mobilization of an army corps, and adjourned on July 28, after a session almost barren of legislative results.

Boulangist Demonstrations.—During the ministerial crisis the Radical populace of Paris became excited over the prospective exclusion of Gen. Boulanger, and when the list of the new ministry was published, it was decried in the Radical journals as a "German Cabinet." On taking leave of office, Boulanger thought it fit, contrary to all precedent, to issue a farewell order of the day to the troops, closing with the words: "I shall be the first to set you the

example of that twofold discipline, at once military and republican." The evening of the day on which the ministers appeared before the Chamber, May 31, was the occasion of a grand military festival that had been arranged by the departing Minister of War. He refrained from attending. During the festivities crowds gathered around the Opéra cheering Boulanger and marched to the Ministry of War, shouting for his return. Finally troops appeared, and drove from the Opéra square the clamoring and singing mob.

Gen. Boulanger was assigned to the command of the Clermont-Ferrand Army Corps. His departure for his post was the occasion of noisy demonstrations in the streets of Paris, at the Lyons railroad-station, and in the towns along the route. This was followed on July 11 by a Radical attempt to upset the Government on an interpellation of Tony Révillon, who charged it with an alliance with the Right and an indifference to Royalist intrigues. M. Clémenceau, by whose influence Gen. Boulanger had first been elevated to the ministry, while asserting that the general's popularity was due to his being attacked by the German press and the Right, declared that Gen. Boulanger was now in his right place, and ought to remain in it. M. Laisant, who had just resigned from the army bill committee on the rejection of the two-year service, followed with a defense of Boulanger, declaring that the Rouvier Cabinet had been constituted under foreign pressure. The uproar caused by this remark was such that M. Floquet tendered his resignation as speaker, but it was not accepted. M. Rouvier declared that in case a clear majority of all the Republicans voted against the ministry it would resign. The Right joined their votes to those of the Opportunists in support of the Government, securing a majority of 382 against 120.

The imposing demonstrations that attended Gen. Boulanger's return to the routine of his profession did not occur without some encouragement or connivance on his part. Not long afterward he seized on another opportunity to keep his personality before the public. M. Ferry, in a speech at Epinal, alluded to him in sarcastic terms as a "St. Arnaud of the music-halls," comparing him with the general who carried out Louis Napoleon's *coup d'état*. Gen. Boulanger thereupon sent a challenge to the statesman, which was accepted. Yet when the former, claiming "a serious satisfaction, justified by the gravity of the offense," insisted that the parties should continue firing until one should be struck, or should shoot with deliberate aim at twenty paces, M. Ferry's seconds would not accede to such an encounter, deeming sufficient the customary exchange of shots at twenty-five paces, as in the duel fought a year before between Boulanger and M. de Lareinty, a Royalist senator who had branded as "cowardly" a reference to the exiled Duc d'Aumale. The result of the disagreement of

the seconds was that no duel took place. Just before this incident Gen. Boulanger had intimated, in a conversation that was made public, that during the ministerial crisis he had repelled two incitements to a *coup d'état*, one proceeding from the Monarchists, and one approved by ninety-four generals of the army.

Irritation against Germany.—The increase of armaments and greater attention to military precautions in both France and Germany led to acts and incidents that intensified the ill-feeling between the two countries. The Germans expelled a great number of the citizens of Alsace-Lorraine, including a deputy in the Reichstag, named Antoine, and a German official decoyed a French functionary to the frontier, and there had him arrested. (See GERMANY). Military trials in Germany afforded proof that Gen. Boulanger had elaborated a system of military intelligence that required the services of many paid agents in Germany. The French have cried out against German spies for years, but have not been so successful in detecting their methods. An official in the French War Office was in March detected in giving up documents to the military *attaché* of the German embassy. Several arrests of supposed German spies were made by local officials. The feeling of hostility against Germans was so strong that persons of that nationality were nowhere safe from insult. The provocations on both sides were less frequent, and irritation subsided after the retirement of Boulanger, but in the beginning of August the closing of a factory belonging to a German who had burned a French flag at Emberville was followed by the expulsion of French railroad officials from their homes in a German village.

The Mobilization Experiment.—Gen. Boulanger had planned a mobilization test on the German frontier, but his successor was unwilling to take such a course without an understanding with Germany. After some diplomatic correspondence it was decided to make the experiment on the Spanish frontier, where no fears would be aroused. Four days before the orders were issued the main features of the scheme were divulged by a person who had access to the War Office, and were published in a newspaper. Some changes were made in the plan on this account. The bills for the mobilization were issued on August 30. The 17th Army Corps, including the departments of Arriège, Haute-Garonne, Gers, Lot-et-Garonne, and Tarn-et-Garonne, was ordered to concentrate in the neighborhood of Castelnaudary, in the Aude, to meet a supposed enemy marching on Toulouse. The troops reached the point of concentration in from two to six days, and during the ten days following carried out various manœuvres, ending with a march to the frontier against the putative invader. Serious defects were observed in the administrative services, especially the commissariat, and officers responsible for failures were displaced.

Manifesto of the Comte de Paris.—On September

14 the Comte de Paris published a manifesto in the form of instructions to the representatives of the Royalist party, in which he defined the system of monarchy that he would set up in France. The main features of his scheme are the restoration of the royal prerogative and the re-establishment of an aristocratic senate. He would even deprive the popular representatives of their control over the budget. The restoration of the monarchy might take place by the vote of a constituent assembly or by a *plébiscite*, and preferably by the latter method, which, however, could not be invoked to unseat the king, who would be resuming his historic right and reviving the covenant with the nation which has its sanction in historical tradition. The most important paragraphs of the document are the following:

It is to direct universal suffrage that the choice of deputies ought to belong. Thanks to its early origin and its recent establishment the monarchy will be sufficiently strong to reconcile the custom of universal suffrage with the guarantees of order which the country, disgusted as it is with the republican system of parliamentary government, will demand of it. The country will desire a strong government, because it clearly understands that even the real parliamentary system, which under the monarchy cast so much splendor on the years from 1815 to 1848, is not compatible with an assembly elected by universal suffrage. The method of election must be modified in order to fit it to this new and powerful agent. Under the republic the Chamber governs without control; under the monarchy the king will govern with the concurrence of the Chambers.

By the side of the Chamber of Deputies an equal authority will belong to the Senate, which will be partly elective, and which will unite in itself the representatives of the great forces and interests of society. Between these two assemblies royalty, having its ministers as interpreters and able to lean for support on either the one or the other, will be enlightened and guided, but not enslaved. It needs but a modification of our parliamentary system to maintain this equilibrium and to obviate all exclusive domination of one Chamber or the other. The budget, instead of being voted annually, will be in future an ordinary law, and consequently can only be amended by the agreement of the three powers. Every year the financial project will include only the modifications proposed by the Government on the last budget. If these proposals are rejected all the public services will not be thrown out of gear, nor will private interests be compromised, as they now would be by the rejection of the budget, and meanwhile real constitutional principles will be respected, for no new tax can be imposed, no new expense can be determined on, without the consent of the representatives of the nation.

To these representatives will also fall the task of fully discussing all the subjects which interest the country, of listening to all complaints which the action of the Government can relieve. If these complaints are legitimate, the representatives will be the first to give them utterance, and the adhesion of the other assembly will not fail them. But a caprice of the Chamber of Deputies will no longer be able unexpectedly to paralyze public life and the national policy. The monarchy will have to re-establish economy in finance, order in administration, and independence in the exercise of justice. The monarchy will have to raise by peaceful means our position in Europe, to make us respected and our alliance sought after by our neighbors. The ministers who serve the monarchy in this great undertaking will not be able to persevere in the realization of its views if they are

trammelled by the fear that their efforts may be interrupted by a simple parliamentary accident. They will feel themselves set free from such a fear when they find themselves responsible not to one omnipotent chamber only, but to the three estates invested with legislative power. Thus the deputies, being no longer able to raise to power or to overthrow ministries, will not exercise that disastrous influence which is as fatal to the Assembly as to the Administration.

The Royalist pretender promised to guarantee to the clergy the respect that is necessary to insure the adequate pursuit of their calling, and to restore to the districts independence in educational matters and to France freedom of religious education. The army would have a single and immovable head, and thus be sheltered from the fluctuations of politics. The monarchy would satisfy at once the conservative needs of France and her passion for equality. The stability of a monarchical government would enable it to study the problem of industrial conditions and work for the amelioration of the lot of the working-people. Universal suffrage would be preserved for the election of deputies in parliament and for the appointment of mayors by the municipal councils in the rural communes.

The Sale of Decorations.—A disclosure of guilt and dishonor in high places startled the country before the Chambers met again. A woman named Limouzin, who had access to persons of influential position in military and political circles, had offered to procure the cross of the Legion of Honor for certain people in mercantile life, who informed the police. A detective, representing himself to be a silk-merchant who conducted a model establishment at St. Etienne, went first to one of the woman's agents, Baron Kreitmayer, a Bavarian nobleman who had been convicted in Germany of selling military secrets, and was taken by him to Mme. Limouzin, who introduced him to Brig-Gen. Caffarel, sub-chief of the General Staff at the Ministry of War. This officer had been appointed by Gen. Boulanger as a pliable man in the place of Gen. Peanecellier, who criticised some of the plans of the minister. He was retained with the rest of the staff by Gen. Ferron, but had fallen into disgrace by incurring debts on the merit of his official position. Caffarel told the supposed silk-merchant, who agreed to pay Mme. Limouzin 25,000 francs, that he was deserving, and should have the red ribbon of a chevalier that he solicited. Mme. Limouzin and Gen. Caffarel were arrested and the papers in their houses were seized. Mme. Ratazzi, also known as Mme. de la Motte du Portail, Mme. Véron, who called herself Mme. de Courteuil, and a man named Bayle, were arrested as accomplices of the Limouzin woman. On information given by a jeweler, who was approached by Mme. du Courteuil and Bayle, the police proceeded to the house of another general, the Comte d'Andlau, a senator and a man of considerable military and literary reputation. The senator had fled, and in his house

were found partly burned letters and account-books with incriminating contents. The Comtesse Despréaux de Saint-Sauveur was also arrested. Gen. Caffarel was brought before a military court of honor, which on October 13 found unanimously that he had been guilty of dishonorable conduct and should be placed on the retired list with half-pay.

Gen. Boulanger, in a newspaper interview, accused the Minister of War of pursuing the Caffarel investigation with a view of entangling him in the scandal. Gen. Ferron demanded an explanation, and, on securing an admission that he had asserted that the Caffarel prosecution was directed solely against himself, ordered Gen. Boulanger to hold himself under an *arrêt de rigueur*, or close confinement to his house, for thirty days.

The persons accused of traffic in decorations, who, besides those already mentioned, included Paul Lorentz and a man named Bary, who committed suicide, were arraigned before the Correctional Tribunal on November 7. There was no evidence that Gen. Caffarel had before procured or engaged to procure decorations for money. It was shown that Gen. d'Andlau had received bribes from different persons on the promise of getting them decorated. The prisoners were condemned to suffer various terms of imprisonment, and some of them to pay fines, on the charge of obtaining money on false pretenses, which was all that could be proved. Senator d'Andlau, who had absconded, was sentenced *in contumaciam*.

The Wilson Scandal.—The two generals were the only persons of official station implicated in the transactions of the decoration agency. Some asserted that the authorities would not have made so much of a simple case of swindling if they had not desired to divert attention from a scandal affecting the detective bureau, two of the chiefs of which had ordered card-cases made from the skin of Pranzini, an executed murderer, whose trial had been the sensation of Paris in an earlier part of the year. Many, however, believed that the chief culprits had escaped detection, if they were not, indeed, shielded by the authorities. This supposition was based on a remark of Mme. Limouzin, who, when arrested, said that the police would find at her house letters from Gen. Thibaudin, Mm. Wilson, Delattre, Mac-kau, and others. M. Wilson, the son-in-law of President Grévy, has for years been subjected to journalistic attacks and popular suspicion. He had been accused of making use of his exceptional sources of political information to gain millions on the bourse. His last stock operations, conducted at the time of the Schnaebele incident, when he speculated for a fall in prices, and spoke of war as imminent, resulted in heavy losses for him, because the affair was arranged more speedily than he had expected; still, he incurred obloquy by his conduct, and popular suspicion began from that time to extend to his father-in-law, with

whom he lived. After his name became mixed up in the decoration scandal, his constituents at Tours called on him to appear before them and give an account of his actions. He was received by a crowded assemblage, but, before he had completed his first sentence, his speech was cut short by jeers and cries of execration, and the meeting passed a resolution demanding the resignation of his seat in the House of Deputies. When a committee was appointed by the Chamber to inquire into the scandals that had recently transpired, he demanded an investigation when his case was mentioned, and offered an explanation of his relations with the Limouzin woman, saying that she had once approached him on behalf of her husband, who was one of his constituents. Among the delinquencies now brought to his charge was using the official stamp of the Élysée to forward his private letters and effects through the mails. He confessed the truth of this complaint by paying to the post-office authorities 40,000 francs to cover the amount of postage withheld. When the seized documents were brought into court during Mme. Limouzin's trial, she exclaimed that letters from Gen. Thibaudin and two important ones written to her by M. Wilson in 1884 were missing. The prosecuting attorney and the examining magistrate had three times refused to receive the documents from the police authorities on account of informalities before they were finally delivered, duly sealed and scheduled. When Mme. Limouzin's papers were seized, the prefect of police, M. Gragnon, discovered the two letters, the first of which began by saying that the President of the republic, as well as Wilson, was doing his utmost to have Gen. Thibaudin promoted, though thus far without success. M. Gragnon took them to M. Grévy, who threw them into the fire. When Mme. Limouzin demanded their production, he asked to have them returned. M. Grévy then told his son-in-law to rewrite the letters, which he did, omitting the compromising passages. These substituted letters, with those from Gen. Thibaudin, were then produced in court. The woman declared that they were like the letters that Wilson had written her, but were not the same. No credence was given to this assertion in the face of M. Wilson's denials until it was shown that the forged letters were written on paper bearing a water-mark that was not used till 1885.

The trial of M. Wilson and of the police officials, MM. Gragnon and Geron, for the abstraction of the letters took place in December. The court decided that the case did not fall within the penal code, because Mme. Limouzin was not prejudiced by the suppression of the letters, which act was fastened on M. Gragnon, or the fabrication of substitutes, in which M. Wilson was concerned. The latter could not be held on a charge of forgery, because the contents were similar and the signature his own in the original and the substituted letters.

The Presidential Crisis.—The discovery that

M. Wilson and the police had been guilty of the suppression and falsification of judicial evidence, and made away with documents that were so incriminating as to require to be concealed by criminal means, produced a state of political perturbation that led almost to anarchy. M. Gragnon was dismissed from office for his share in the transaction. M. Mazeau, the Minister of Justice, resigned, but was induced to continue in his post. M. Wilson would not resign his seat in the Chamber in order to stand a criminal trial, and therefore a motion was brought to allow the authorities to prosecute. He did not appear before the committee to which the case was referred, and when, on November 17, the vote was taken on the question of waiving his immunity as a deputy from arrest, the Chamber was unanimous in his condemnation. M. Grévy had already threatened to resign if the Chamber voted for prosecution, while in the legislative hall and in the street were heard demands for his resignation, which became gradually more decided.

On November 20 M. Clémenceau demanded a discussion of the general political situation. M. Rouvier declined to enter into a discussion until after the conversion of the debt on the 24th; but the Radical leader ridiculed the idea that the Cabinet could save the financial situation by saying, "Rest in peace till Wednesday, and on Thursday I promise you a crisis such as marks an epoch in parliamentary history"; and continued, "Action is needed. There is no government. Public power is without authority; the administration is disorganized. This infamy can last no longer. You demand time, but the disaster accords none." The Royalists supported the interpellation, and M. Rouvier, being defeated by 328 votes against 242, announced the resignation of the Cabinet.

The vote was directed against the President, but M. Grévy declared that he would not yield to an unconstitutional agitation or to legislative pressure. The retiring prime minister advised him to send for M. Clémenceau, but he first asked M. de Freycinet to form a Cabinet, and, after next consulting M. Floquet, and then M. Goblet, at last appealed to M. Clémenceau, who told him, like the others, that the crisis was of a presidential rather than of a ministerial character. M. Brisson, who was next called, M. Le Royer, the President of the Senate, and M. Ribot likewise intimated that the only solution was his retirement from the presidency. He was told the same thing by several others. He appealed a second time to M. Clémenceau, of whom he said in May that when he entered the Élysée by one door he would leave it himself by the other. When Henri Maret, almost the only journalist that had defended him, declined to attempt to form a ministry, and advised the President that there was no man in the French parliament who had sufficient influence to prevent his

retirement, M. Grévy, on November 23, announced his decision to resign. He requested M. Ribot to form a Cabinet, and charged him to convey his message of resignation to the Chamber. M. Ribot consented, but afterward advised him to confer with the retiring ministers, as the message was a political act, requiring the approval of the Cabinet. He recalled M. Rouvier and his colleagues, who consented to continue in office only for the purpose of delivering his message. Although he was told by every responsible politician that his continuance in power was impossible, M. Grévy, with the obstinacy of conviction and vacillation of purpose characteristic of his period of life, after authorizing M. Rouvier again to announce his retirement in a note published on November 26th, recalled the decision in the afternoon. The minister told him that he was at liberty to refrain from laying down his functions, but that the ministers could not continue in office. After another conversation on the following morning, the President authorized him to publish a note requesting the Chambers not to meet till Thursday, Dec. 1, when a message would be communicated to them.

The fears and passions of the French were wrought up by the prolongation of the crisis. The Communists and Socialists of Paris carried on an agitation against M. Ferry, and threatened a rising if he were elected President. His supporters among the moderate Republicans were the more determined to press his claims to the succession. Many of the Radicals, with timorous persons of various parties, and some who, like the President, desired to preserve the constitutional principle of a fixed term for the presidential office, and to keep it beyond the reach of parliamentary attacks and popular clamor, urged M. Grévy to withdraw his resignation. When the Chambers met on December 1 to hear the message, M. Grévy told the ministers that, in view of the danger of insurrection, and of a popular demand from all parts of France that he should defend the Constitution and the prerogatives of his successors, he could not retire. They offered their resignation, which, they said, should be final, and, returning to the Chamber, announced that the President had altered his resolution, and that they had in consequence resigned. The house suspended its sitting for two hours, and the Senate passed a similar resolution, while the ministers informed the President.

When the news of what had happened spread abroad, the streets and squares filled with people. The legislators were agitated by rumors of a *coup d'état* and dread of a revolution, and it would have been possible for a small band of resolute men to gain possession of the hall. The mob, however, had no revolutionary purpose. The troops were vigilant, noisy demonstrations were stopped, and in the evening Louise Michel, the anarchist, and Paul Déroulède, chief of the Patriotic League, were arrested while leading processions. In the even-

ing, meetings at Belleville and in the other faubourgs were addressed by Gen. Endès, Municipal Councilor Vaillant, Citizen Basly, and other socialist deputies and revolutionary orators. Denunciation of Ferry formed the burden of their speeches. He has incurred the hatred of the democracy, and is decried as "assassin" and "Tonquinese," not so much because he is politically responsible for the Tonquin expedition, but because he is supposed to have made that and other acts, especially his policy toward Germany, the means and the cover of financial speculations, by which he has acquired great wealth. Gen. Boulanger, who, with other corps commanders, was ordered away from Paris, and left for his post, was very little heard of.

The Chamber resumed its sitting only to adopt another resolution of adjournment in expectancy of "the communication which was promised it." On again coming to order, it listened to a statement from M. Rouvier, who announced that the President had no idea of entering into a conflict with the national representatives, and would on the following morning make known his sentiments on the situation. When the House met on December 2, M. Floquet read the message, which was couched in the following terms:

As long as I had only to contend with the difficulties that have accumulated in my path—the attacks of the press, the abstinence of the men whom the public voice called to my side, and the increasing impossibility to form a ministry—I struggled on and remained where duty bade me, but at the moment when public opinion, better informed, marked a change which gave me hope of forming a government, the Senate and Chamber of Deputies voted a double resolution, which, under the form of an adjournment to a fixed hour to await the President's promised message, is tantamount to summoning the President to resign. It would be my duty and right to resist, but under the circumstances in which we are placed a conflict between the Executive and Parliament might entail consequences which restrain me. Wisdom and patriotism command me to yield.

I leave to those who assume it the responsibility for such a precedent and for the events that may ensue. I relinquish without regret, but not without sadness, the position of power to which I have been twice raised without solicitation, and in which I feel conscious I have done my duty. To this I call France to witness. She will say that for nine years my government has secured to the country peace, order, and liberty, has made France respected throughout the world, has worked unremittently to raise her, and surrounded by an armed Europe leaves her in a condition to defend her honor and rights; further, that at home it has been able to maintain the republic in the wise course traced before it by the interest and wishes of the country. She will say that, in return, I have been removed from the post where her confidence placed me. In leaving political life I form but one wish. It is that the republic may not suffer from blows aimed at myself, but that it may issue triumphant from the dangers it is made to incur.

I place on the bureau of the Chamber of Deputies my resignation of the functions of President of the French Republic.

The Congress to elect a new President was summoned to meet at Versailles on the following day.

Street Rioting.—After the resignation of the President riotous demonstrations against Ferry took place in the streets. A crowd that surrounded the Palais Bourbon was driven away by the military and police. The deputies, Camélinat, Duc Quercy, and Basly, marched at the head of a procession toward the Hôtel-de-Ville, and when they attempted to force a passage through a squadron of the Garde Républicaine, the soldiers charged into the crowd, and striking with the flat side of their sabers, soon put the mob to flight. Other crowds were dispersed in like manner. There were revolvers fired and stones thrown at the soldiers, but no one was killed on either side. The Municipal Council met at six o'clock, and passed a resolution expressing the conviction that the election of Jules Ferry would lead to the shedding of blood in the streets of Paris, and civil war throughout France.

The Presidential Election.—The election took place in the great hall of the palace of Versailles, on the afternoon of December 8. The Opportunists were united in favor of M. Ferry, while the Radicals had expected to support M. de Freycinet. The Right had been expected to give their votes to M. Ferry, but they determined to throw them away on Gen. Sausier, who had declined to be a candidate, or on Gen. Appert. In the Republican caucus, M. Sadi-Carnot had been prominently brought forward as a compromise candidate, yet the friends of M. Ferry did not despair of gaining monarchist votes, and electing him yet. The first vote gave Sadi-Carnot 803 ballots; Ferry, 212; Sausier, 148; de Freycinet, 76; Appert, 72; Brisson, 26; Floquet, 5; Anatole de la Forge, Félix Pyat, and Pasteur, 2 each; and Spuller, 1. MM. Ferry and de Freycinet announced their withdrawal in favor of M. Carnot. On the second vote M. Sadi-Carnot was elected by 616 ballots, to 188 cast for Gen. Sausier, 11 for Ferry, 5 for de Freycinet, and 1 for Pyat.

The Tirard Cabinet.—The Rouvier ministry banded in their resignations to the new President, who had much difficulty in finding a statesman who could form a Cabinet. M. Fallières declined to undertake the task. M. Goblet conceived the idea of uniting in the same ministry men from the opposite wings of the party, but gave up the attempt. On December 18 a Cabinet was formed from Opportunist elements, composed as follows: President of the Council and Minister of Finance, Paul Emmanuel Tirard, born in Geneva, of French parents, in 1827, who established a wholesale jewelry establishment in Paris, was a zealous Republican under the Empire, a deputy in 1871, afterward a life-senator, Minister of Agriculture in 1879, and subsequently Minister of Finance; Minister of Foreign Affairs, L. E. Flourens; Minister of Justice, M. Fallières; Minister of the Interior, Jean M. F. Sarrien, who held the same portfolio under M. de Freycinet in 1866; Minister of Education and Worship, M. Faye, a

senator; Minister of Marine and the Colonies, François O. de Mahy, a native of Réunion; Minister of Public Works, M. Loubet; Minister of Agriculture, M. Viette; Minister of Commerce, M. Dautresme; Minister of War, Gen. Logerot, who was a colonel in the war of 1870, distinguished himself in Tunis in 1881, was made general of division, and succeeded Gen. Forgemol in the chief command.

In President Carnot's inaugural message, read in Parliament on December 18, he speaks of himself as "one of the most modest servants of France," and appeals to the patriotism of the deputies to sustain a policy of "progress, reconciliation, and concord."

Attempted Assassination of Jules Ferry.—The agitation against M. Ferry during the presidential canvass prompted a desperate man, who was desirous of notoriety, to attempt his life in the lobby of the Chamber, on December 10. He sent in his card, and when M. Ferry appeared, while engaging him in conversation, fired two shots from a revolver, but inflicted only a slight wound.

The Paris Municipality.—A question underlying the political events of the year was the old one of the right of the communes, notably the city of Paris, to legislative autonomy. The idea of local self-government, which inspires with dread all the conservative elements of French society, and has been resisted and repressed by every means, because the hopes of the Socialists and Revolutionists of every shade are bound up in it, has made great progress in the past two or three years, and has been adopted as a practical issue by a considerable section of the Radical party in parliament. The elections for the Paris Municipal Council in May resulted in a large increase in the Radical and Revolutionary elements in that body. On July 27 the municipality voted to convene a congress of municipal delegates, but the government vetoed the project. The President of the Municipal Council nevertheless issued a circular inviting delegates of all French municipalities to meet on September 22, and the Minister of the Interior again interfered, threatening to annul any resolutions passed in response to the invitation. The fear of a Paris commune and central mayoralty was the main motive that deterred M. Grévy from calling on M. Clémenceau to form a ministry in May, and that governed the selection of the Tirard Cabinet in December.

The Exhibition of 1889.—The Republic received negative replies from the monarchical governments of Europe in response to its invitation to participate in a world's fair at Paris in 1889. The Czar of Russia directed his minister to declare that the Russian Government would take no part in festivities for the glorification of a revolution, and would prohibit Russian merchants and manufacturers from having anything to do with it. The German and Austrian Governments declined to countenance the exhibition by any official

action. The Chamber has appropriated the sums necessary for the exhibition. Buildings, including a great iron tower, are being erected in Paris. During the exhibition there will be held, under the direction of committees appointed by the Minister of Commerce, meetings and lectures on literature, art, history and archæology, mathematical science, physics and chemistry, natural science, geography, political economy and legislation, hygiene and sanitation, social economy, education, engineering, agriculture, industry, and commerce.

Algeria.—The area of Algeria is 818,834 square kilometres, not including the territory extending into the Desert of Sahara, which is 849,900 square kilometres in extent. The population on May 30, 1886, was 8,867,465, of which number 3,324,475 are resident in the territories administered by the civil authorities, 492,990 in the military divisions, and 50,000 in the Algerian Sahara. The number of Arabs and Kabyles is 3,274,854; of French, 261,591; of naturalized Israelites, 23,376. The population of the city of Algiers was 71,199. The budget for 1886 makes the receipts 42,837,628 francs, and the expenditures 52,738,472 francs. The imports in 1884 amounted to 289,800,000 francs, and the exports to 175,900,000 francs. There were 2,065 kilometres of railroad in operation in April, 1887.

Tunis.—The regency of Tunis has an area of about 116,000 square kilometres, and a population of 1,500,000 souls, of which number 35,500 are Christians, 45,000 Israelites, and the rest Mohammedans. Tunis, the capital, has 150,000 inhabitants. The expenditures of the Government amounted in 1886 to 27,145,000 francs. There is a debt of 142,550,000 francs. The value of imports in 1886 was 80,215,775 francs; of exports, 19,416,475 francs. The chief exports are rye, barley, olive-oil, and esparto-grass. There are 410 kilometres of railroad completed.

Annam.—The kingdom of Annam was taken under the protectorate of France in 1884. A French resident-general represents the republic in the citadel of Hué, with a military escort, and under the treaty European engineers and agents were to direct the customs, public works, and other services. The province of Tonquin was placed more particularly under French control, and is administered by native functionaries under the direction of French residents in all the chief places.

The area of the kingdom is about 275,300 square kilometres. The population of Tonquin is from 10,000,000 to 12,000,000 persons; that of the rest of the kingdom about 2,000,000. The receipts of Annam and Tonquin in 1887 amounted to 44,860,000 francs, including a subvention of 30,000,000 francs. The expenditures were calculated at 44,758,280 francs, of which 20,425,000 francs were for the military, and 10,830,000 francs for the naval expenditure. The imports of Annam in 1883 amounted to 2,860,000 francs, and the exports to 1,200,-

000 francs. The imports of Tonquin for 1885 are reported as 21,679,879 francs, and the exports as 8,079,438 francs.

The fighting in Tonquin still continues. In January, 1887, the French made two unsuccessful attempts to expel a rebel force from Than Hoa, where they were strongly intrenched. A few weeks later Col. Brissaud captured a fort in the same district, which was stubbornly defended by Chinese and Annamites from Thuyet. Columns were sent into the provinces of Phu-Yen and Bin-Dinh. By June the rebels had been driven into the remoter districts. The delimitation of the Chinese frontier had then been nearly completed. By a ministerial decree, issued August 4, the system of protection, exempting from duty French merchandise imported in French ships, and subjecting to the French general tariff all foreign merchandise, was established in Cochin-China, Cambodia, Annam, and Tonquin. Foreign goods in transit pay only one fifth of the regular duty.

Colonies.—The colonies and protectorates of France, including Algeria, Tunis, Madagascar, and Annam, have a combined area of 3,043,600 square kilometres, and an aggregate population of 28,315,400 souls. The French establishments in India, with an area of 508 square kilometres, had, in 1885, a population of 275,261. The public expenditure in 1885 was 2,206,000 francs; imports, 8,000,000 francs; exports, 26,500,000 francs. The colony of Cochin-China, is 59,800 square kilometres in extent, and in 1885 contained 1,792,933 inhabitants. The colonial budget was 28,483,000 francs, exclusive of 3,239,000 francs of expenditure assumed by the French Government; imports, 108,700,000 francs; exports, 85,400,000 francs. The protected kingdom of Cambodia has an area of about 100,000 square kilometres and 1,500,000 inhabitants. The French resident-general was in April, 1887, appointed Prime Minister to King Norodom, and intrusted with the task of reorganizing and directing the finances. The kingdom has an export and import trade of from 10,000,000 to 12,000,000 francs, not reckoning the commercial movement across the frontier of Siam.

The estimated extent of Senegal and its dependencies in 1885 was 667,000 square kilometres, the population, 3,817,465. Protectorates have been proclaimed over the Upper Senegal and the Upper Niger. The warlike natives in these regions frequently attack the French posts. The colonial expenditure in 1885 was 2,861,000 francs, besides 8,897,000 francs which were made a charge on the treasury of the republic. The imports in 1885 were 25,100,000 francs; the exports, 19,500,000 francs. The French possessions on the Gold Coast had, in 1885, an extent of 24,000 square kilometres. The French authorities made treaties with chiefs of an extensive tract on the northern bank of the Gambia river, called the Badiboo territory. The British officials at

Lagos, conceiving the opinion that the region belonged within the sphere of British influence, led a force into the district in April, 1887, and placed a chief in power who was friendly to the English. The French thereupon repelled him, and reinstated their *protégé*, raising the French flag over the districts of Badiboo Saba and Sangally. The officer in command of the troops at Lagos marched into the disputed territory, and pulled down the French flag. The British and French Governments both sent gunboats and higher officials to the spot, and entered into diplomatic correspondence over the question. Sir Samuel Rowe, Governor of the British West African settlements, hoisted the British flag at various points on the Gambia river, but the French remained in practical possession of the Badiboo district. The estimated area of the French possessions at Gaboon and on the Congo is 670,000 square kilometres. On May 27, 1887, a diplomatic arrangement was concluded between France and Germany, legalizing the importation of spirituous liquors, rifles, gunpowder, and tobacco into their possessions on the Slave Coast, at fixed rates of duty. The expenditure of the colonial government in Gaboon in 1885 was 619,000 francs, and that of the home Government 125,000 francs. The trade is about 1,900,000 francs either way. For the French Congo, M. de Brazza, the Governor, was allowed 1,600,000 francs in the budget of 1887. A convention concluded in April, 1887, between France and the Congo Free State, alters the boundaries indicated in the original treaty in favor of France. The Lecona river and the 17th meridian of east longitude were to mark the eastern boundary of the French possessions. It has since been ascertained that the Lecona is not a favorable route into the interior, and by the new arrangement the boundary will follow the Dubrangi or Mabongi, the right bank of which is to belong to France, and the right bank of the Congo below their junction. The Congo Free State in return acquires the right of having its loan quoted in Paris to the amount of 80,000,000 francs. France also admits that the preemptive rights acquired in 1883 over the Congo possessions can not be exercised against Belgium, should it desire to acquire the territory of the Free State, but only in respect to other powers, should the founders desire to cede the territory. On the east coast of Africa are the colonies of Réunion, Sainte-Marie de Madagascar, Mayotte, Nossi-Bé, and Obock, besides the recently annexed Comoro Islands, which were occupied without fighting, and the resident installed at Anjouan on March 25, 1887. These islands, which lie between the island of Madagascar and the African continent, are 1,606 square kilometres in extent, and contain 58,000 inhabitants. There occurred in the early part of 1887, disputes between French and English authorities on the Somali coast, and a line of demarkation was agreed on, be-

yond which each power engaged not to extend its possessions, after an English officer had hauled down the French flag at a place called Dongareta. The understanding that was arrived at between Lord Salisbury and M. Flourens, recognizes the rights of France over the Obock territory and the Gulf of Tadjourah, Great Britain ceding the island of Mashah, lying in the middle of the gulf. The frontier line of the French territory extends from Cape Djiboujeh to Harrar, and thence westward to Shoa. France acknowledges the rights of England to the territory situate to the east of Cape Djiboujeh, including Dongareta.

The colony of St. Pierre and Miquelon, with an area of 285 square kilometres, had, in 1885, 6,800 inhabitants. The imports were 13,200,000 francs, and the exports 20,200,000 francs. Guadeloupe and its dependencies have 1,870 square kilometres of territory, and in 1885 contained 181,098 inhabitants, and exported 7,700,000 francs worth of goods, with imports amounting to 4,800,000 francs. Martinique is 988 kilometres in area, with 169,282 inhabitants, and imported 21,900,000 francs, and exported 21,500,000 francs worth of merchandise. French Guiana has an area of 121,418 square kilometres, and 26,502 European inhabitants. The imports in 1885 were 19,500,000 francs, and the exports 18,000,000 francs.

In the Pacific the penal colony of New Caledonia, with the Loyalty Islands, has an area of 19,950 square kilometres, and had a population of 56,453 souls in 1885. The imports amounted to 8,500,000 francs, and the exports to 4,600,000 francs. The New Hebrides, occupied by French troops, have not yet been definitively annexed. (See *NEW HEBRIDES*). The other possessions in the Pacific include Tahiti, the Touamotou Archipelago, and the Wallis Islands, which were annexed in 1886. The latter have an area of 96 square kilometres and 8,500 inhabitants. They are situated between the Fiji and Samoa islands, and were occupied, with the intention of making them a coaling-station, by the expedition which went from Noumea in April, 1887. The total expenditure of the French Government on its colonies in 1885 was 82,659,000 francs.

FRIENDS. General Conference of Yearly Meetings.—A General Conference of the yearly meetings of Friends in America, with those of London and Dublin, met in Richmond, Ind., September 22. The meeting was held in pursuance of a call which was made by the Indiana Yearly Meeting in 1886, for such a conference, to consider matters of doctrine, government, and methods of work, and to consult with respect to a closer union of the several bodies of Friends. Thirteen yearly meetings were represented by 108 delegates. The first question discussed after the preliminary matters of organization were disposed of—"Is it desirable that all the yearly meetings of Friends in the world should adopt one declaration of doctrine?"—was answered in the affirmative.

To the second question, "What is the mission of the Society of Friends, and what is its message to the world?" the answers were given in substance: That the mission of the Society is to declare salvation to lost men; to promulgate a pure, sound, full gospel; to hold theology in a living experience, so that the doctrines preached shall be ever fresh and vital; to labor to get men saved and sanctified; to go with Christ into every reform, especially peace, temperance, and purity; to maintain the priesthood of believers and simple worship without priestly intervention; to preach the only saving baptism which is Christ's with the Holy Ghost, and the one Supper of the Lord, which is the spiritual partaking of his flesh and blood. That mission can be best fulfilled and that message declared by Friends being pure, baptized with the Holy Ghost, filled with Christ's love, called to the work, united, and well organized; by preaching, teaching, writing; going to the poor, rich, honored, and unlearned; and by being zealous as missionaries, evangelists, and pastors, according as God bestows gifts. The Conference declared it desirable that there should be a union in missionary work of the yearly meetings, which have now, severally, their own separate missions. The following paper was adopted on the questions of baptism and the Lord's Supper: "A number of suggestions having been made by members of the Conference to the business committee, in reference to the teaching of water baptism and the Supper by those in official position in the Society of Friends, the committee have given careful attention thereto, but believe that the recent official utterances and reaffirmations of eight yearly meetings on this continent have definitely settled that question. They present with the report the minute of the Indiana Yearly Meeting, which is in substantial agreement with the minutes of other yearly meetings, and advise that the subject be not entered upon or debated at this time." The minute referred to declares that: "We believe it to be inconsistent for any one to be acknowledged or retained in the position of a minister or elder among us who continues to participate in or to teach the necessity of the outward rites of baptism and the supper." Concerning the manner of conducting public worship, a general consensus was expressed in favor of preserving the long-established form of silent meetings, having Jesus as the only head, and no minister necessary but much to be desired. The discussion of the question of "The proper relationship of the ministry to the Church, and the duty of the Church toward the ministry, in connection with the liberty of prophesying, and the necessity of maintaining it inviolate in all our meetings," which involved the propriety of recognizing the innovations of revival meetings, with acknowledged leaders, and formal supplies of regular ministers to certain meetings, disclosed a predominance of sentiment in favor of these movements. A declaration of

doctrines was adopted which was compiled from the expressions made at various times by the different yearly meetings. It includes the headings of "God, our Father, Son, and Holy Ghost"; "The Lord Jesus Christ"; "The Holy Spirit"; "The Holy Scriptures"; "Man's Creation and Fall"; "Justification"; "Sanctification"; "Regeneration"; "Baptism"; "The Lord's Supper"; "Worship"; "Ministry, and the Exercise of Spiritual Gifts"; "Prayer and Praise"; "Civil Government"; "Peace"; "Oaths"; "Marriage"; and "The First Day of the Week," upon which, except that the outward rites of baptism and the Lord's Supper, war, fighting, and oaths are specially declared against, the expressions are in general harmony with the doctrines held by the Protestant churches of the Arminian school. A paper was read by Dr. William Nicholson at the Indiana Yearly Meeting, whose session was held after the close of the Conference, advocating the institution of triennial conferences, and of a court of final appeal uniting and binding all the yearly meetings.

London Yearly Meeting.—The statistical reports to the London Yearly Meeting gave the whole number of members of the Society of Friends in England as 15,458, and in Ireland as 2,774. These returns show an increase during the year of 78 members in England, and a decrease of 61 in Ireland. The number of attendants upon meetings not members was 5,803 in England, and 660 in Ireland. The London Yearly Meeting assembled May 18. Though having no official supremacy in the Society, it, being the parent body of all, is recognized by the denomination at large as the leading meeting, and general respect is accorded to its determinations on matters affecting the interests of the Society; and they have usually been influential in pointing out the course to be followed by the other meetings. A question which had already given considerable difficulty came up before the meeting concerning correspondence with the American meetings. Divisions have occurred in several of the yearly meetings of the United States and Canada on questions of divergent practices in meetings. While conservative members still hold to the old order of quiet meetings, and look disparagingly on active movements for spreading the Word, other parties favor active methods, with diversified services, somewhat resembling those employed by other Protestant denominations; and several meetings have been split in two on these divergences. To maintain the even balance, and recognize by correspondence the party representing the English society as it is, has not been an easy task. A conference had been held in London on the subject in the autumn of 1886, but no real change had been made, and the discussion at the present yearly meeting was without result. The Meeting for Sufferings was commissioned to prepare a scheme for simplifying and amending the marriage usages of the society. The committee on education

was directed to report to the next yearly meeting respecting the feasibility of establishing a high-class school for young men. The policy followed by the Home Mission Committee in the organization and execution of the work intrusted to it was discussed. On the one side it was feared that the committee was departing from the usages of the Society; on the other side it was shown that the committee represented an almost similar organism that was vital when Friends' principles flourished most in England. The committee was reappointed. The meeting was interested in the discussion of a possible manner in which it might use its influence for the preservation of peace between nations whose relations appear precarious, without becoming involved in political complications. The Meeting for Sufferings was asked "prayerfully and carefully" to watch, and as the way may open, to promote by deputation or otherwise, peaceful solutions. A deputation was appointed to attend the General Conference of yearly meetings to be held in Richmond, Ind., in September.

Friends' Missions.—The annual meeting of the Friends' (English) Foreign Mission Association was held May 23. Mr. Arthur Pease presided. The income of the Association for the year had been £8,587, and the number of missionaries employed 24. A medical missionary academy had been opened in Mada-

gascar, and diplomas had been granted to eight Malagasy students. The mission in that country returned 33,000 adherents, of whom 19,500 were regular attendants at worship. The work carried on there was chiefly educational. At the Syrian mission 5,121 cases had been treated at the dispensary, and the attending physician had made more than 1,000 visits. A hospital had been opened at Ramleh, Palestine. Favorable reports were also received from the missions in Natal, India, and China. The Friends' Tract Association had expended more than £200, and had a balance of £50. The total issue of tracts had been 130,194, against 103,684 in the previous year, with 23,000 leaflets in addition. A considerable proportion of these tracts were in foreign languages. The standing committee of the London Yearly Meeting brought in reports from France, Germany, Australasia, Norway, Denmark, Constantinople, Syria and Palestine, Madagascar, India, Natal, and China, representing the work of the agencies of the society as in most places hopeful and well sustained. While enlightened Christian education was everywhere advanced, the military laws of France and Germany were the only hindrances to Friends in those countries. The Friends' Home Mission had expended £1,887 during the year, the most of it in aid of Friends performing missionary labors in various parts of the country.

G

GEOGRAPHICAL PROGRESS AND DISCOVERY.

Africa.—Although not fewer than the usual number of travelers have been in Africa during the year, and the interests of trade have been served to some extent by the increase of topographical knowledge, yet the gain to geographical science is not large. The chief interest has centered on the expedition undertaken by Stanley for the relief of Emin Pasha—not to bring him away, for he has declared that he will not leave his province, but to open a route of communication and relieve him from his position of isolation from the civilized world, beleaguered as he is by jealous tribes ready to fall upon his troops at any moment. Since he has been able to send letters and packages by way of Uganda and Zanzibar, collections of birds, butterflies, and moths, that he has collected, have been received in London, and accounts of short journeys made in the vicinity of his station. In one of these he visited the Albert Nyanza, and found that, since 1879, a low island, about one kilometre in length, has been formed not far south from the former station of Mahagi, by the deposits of rivers flowing into the lake. He thinks the western part of the lake is gradually filling up. He describes the character and customs of the Monbuttu, their weapons and implements of various kinds. In recent letters

he reiterates his resolution not to desert his province; he can not abandon the results of his twelve years' work of civilization, and still hopes to restore order in his domain; but he is most anxious to secure some means of regular communication with the outside world. His present facilities depend entirely on the caprice of the despotic sovereigns of Uganda and Unjoro, and it is impossible for him to receive arms and munitions of war. If a free route could be opened for him, he might be able to defend his own province, since he has a force of about 1,400 Egyptians and Soudanese. In February last he met with a serious loss by the burning of Wadelai, his principal station, by which large stores of ivory and provisions, as well as much of his private property, were destroyed. The arms and ammunition were saved with difficulty. Emin was compelled, partly by the difficulty of provisioning, to give up the stations at Lado and Gondokoro, which were important as terminals of the navigation of the Nile; but he has on the other hand extended his sway toward the south, and founded a new station, Ssongo, on an island near the western shore of Albert Lake.

In one of his excursions he discovered a new river flowing from the Usungora mountains to Albert Lake, and called Kakibbi by the Wasongora, and Duera by the Wa-mboga. Near

its mouth is a large island. It has a great volume of water, but numerous rapids, making the navigation difficult. He was told by the natives that there is a river to the southwest, on the banks of which lives a colony of the curious dwarf race, or Akkas, called Balia by the Ungoro people, but showing by their speech that they are Betua.

When Mr. Stanley announced his intention of taking the Congo route to Emin's territory, the plan was disapproved by both Junker and Schweinfurth. They thought that at least eighteen months would be required for the journey; and they recommended instead a route from the Red Sea or from Zanzibar.

Mr. Stanley convinced them that the land journey by the Upper Congo would not exceed 400 miles, whereas from Zanzibar to Albert Lake the distance would be 950 miles, and the Masai route would be 925 miles. A strong expedition was determined upon, the cost being defrayed mainly by English contributors to the relief fund with a subsidy from the Egyptian treasury. In Mr. Stanley's own words: "The expedition is non-military—that is to say, its purpose is not to fight, destroy, or waste; its purpose is to save, to relieve distress, to carry comfort. Emin Pasha may be a good man, a brave officer, a gallant fellow deserving of a strong effort of relief; but I decline to believe, and I have not been able to gather from any one in England, an impression that his life, or the lives of the few hundreds under him, would overbalance the lives of thousands of natives and the devastation of immense tracts of country which an expedition strictly military would naturally cause. The expedition is a mere powerful caravan, armed with rifles for the purpose of insuring the safe conduct of the ammunition to Emin Pasha and for the more certain protection of this people during the retreat home; but it also has means of purchasing the friendship of tribes and chiefs, of buying food, and paying its way liberally."

On his arrival at Zanzibar Mr. Stanley found that his agents had already recruited a force of 600 men for the expedition, and that Tippoo-Tip, who had escorted his caravan in 1877 when the first descent of the Congo was made, was waiting for him. Tippoo-Tip was the Zobeir of the Upper Congo, commanding two of the best roads from the river to Wadelai. He agreed to supply 600 carriers at \$30 a man, and, as Emin was reported by Dr. Junker to have 75 tons of ivory, the expenses of the expedition might be largely defrayed by the return of the Zanzibaris to the Congo with their precious loads. Tippoo-Tip was also offered the position of Governor at Stanley Falls at a regular salary. He consented to accompany Mr. Stanley on these terms. The steamer set out on February 25 for the mouth of the Congo with about 700 men of the expedition, reaching its destination in four weeks. It was then 1,266 miles from Aruwimi, whence it

was to march 400 miles through an unknown country to Emin's capital. It was as late as April 26 before it could leave Leopoldville, on Stanley Pool, and it was not until the second week in June that the explorer himself was at Aruwimi, much delay having been caused by defective means of transportation. A rear-guard was left at Yambouya, and the advance column of five Europeans and three hundred and eighty natives passed on to the limit of navigation and began the overland march. Few difficulties were encountered apart from the natural obstacles presented by such a country. Meantime, Tippoo-Tip had gone to Stanley Falls to restore to the Congo State the station which was seized by the Arabs, and gather a company of his people to accompany the expedition as carriers. The steamer "Stanley," the largest on the Congo, returned to Bolobo to carry to the Aruwimi station the remaining men and supplies.

By July 25 the advance expedition had ascended the river Aruwimi as far as an elevated tract of country forming a portion of the Mabodi district. Here the river became very narrow, being no longer navigable, and Mr. Stanley was compelled for several days to have all the provisions and munitions for the use of the expedition, as well as those intended for the revictualing of Emin Pasha's garrison, carried on the men's backs. The quantity of rice was so large that each man had to bear a double burden. The rafts which had been employed to convey the heavy baggage were left behind, and only the steel whale-boat brought from the camp at the foot of the Aruwimi Rapids was carried past the narrows and again launched in the river, Mr. Stanley greatly congratulating himself that he had brought it, owing to the amount of water which, according to the inhabitants of that part of the country, the expedition would have to cross before reaching the Albert Nyanza. Mr. Stanley calculated that, once arrived at the summit of the table-lands which shape the basin of the Aruwimi, he would be able to halt for two days in order to rest his men and establish a fresh camp garrisoned like that at Yambouya by twenty men and a European officer. The population of the country through which Mr. Stanley was then traveling was considerable, but the people were much scattered. The district was tranquil, the agitation prevalent in the neighborhood of Stanley Falls not having spread to that part of the country.

At the beginning of August the expedition was reported to be advancing without the ammunition and stores designed for Emin. Provisions were scarce, the officers and men undergoing great privations, and suffering from disease and hunger. Tippoo-Tip had failed to send to Yambouya the 500 carriers who were to convey the stores. This failure was not due to treachery, since he was still at his post and faithful to Mr. Stanley's interests. In consequence of the disturbed state of the coun-

try he could not, as had been agreed upon, organize a revictualing caravan to be dispatched direct to the Albert Nyanza by way of the river Mbourou, but he agreed to do so as soon as possible. The agitation continued in the country between Stanley Falls and the confluence of the Aruwimi with the Congo. Several villages on the right bank of the Congo had been pillaged and laid waste, and a large number of the natives had crossed the river to the opposite bank.

The last report was that news had arrived at Cairo, December 22, that Stanley had reached Emin Pasha, and details of the latter part of the journey were expected.

Mr. A. J. Wauters advances the theory that the Muta Nsige, discovered by Stanley in 1876, is not connected with the Albert Nyanza or with the Nile system at all, but is the source of the Aruwimi. He founds his opinion on the difficulty of accounting for the great mass of water in the Aruwimi if it is fed only by the streams and springs of the limited territory that can be drained by it. On the other hand, this leaves unaccounted for the fact that the Nile is twice as great when it issues from the Albert Nyanza as when it enters. Perhaps the return of Stanley's expedition, when it is intended to devote some time to exploration, will answer this question, as well as the still unsettled one as to the identity and final destination of the Welle.

The latest attempt to solve this ever-present problem has come to naught. Capt. Van Gèle, who has made journeys on the Ubangi and Lopuri, had charge of this attempt. He left the station of Bangala July 1, with the steamers "Henry Reed" and "A. J. A.," to ascend the Itimbiri, which is supposed to approach nearest to the Welle. The plan was to go up this river as far as it is navigable, to the Lubi Falls, where he was to leave Lieut. Dhanis behind as the head of a new station, while he himself should proceed northward in as direct a line as possible to the Welle. Here another station was to be left in charge of Lieut. Liénart, while the captain himself was to follow the course of the Welle to its mouth. But when he arrived at the falls he found the country uninhabited, contrary to Mr. Grenfell's descriptions; and, learning from a neighboring petty chief that the land he would have to traverse was covered with primitive forests, he saw no way of provisioning his people or making his journey successfully, and returned as speedily as possible.

Lieut. Wissmann made an extended report of his second journey across the continent of Africa at the November meeting of the Berlin Society for Geographical Research. After starting in a southeasterly direction into the territory of the Baluba, the expedition turned to the northeast toward the Lubi; at the mouth of this river Lake Sankuru was traversed, but here it became apparent that the dense and swampy woodlands would not allow farther progress toward the northeast, and the

project of penetrating to the upper waters of the more northerly tributary of the Congo had to be abandoned. Without passing the Lomami, the lieutenant turned his course to the southward, crossed his route of 1881 in the territory of the Beneki, now laid waste by war, slave-hunting, and pestilence, and reached Nyangwe, whence he crossed by the usual route to Tanganyika. From the southern shore of this lake he went to Nyassa and thence to Mozambique by a new way. He reports the people visited on both his expeditions as having made progress during the four intervening years, and taken the first steps toward civilization. A small lake called Limbi has been discovered southeast from the Schirwa or Kilwa Lake, in the Nyassa territory, having an outlet to the larger lake.

Bishop Smythies's report of his journey to Lake Nyassa and the Magwangwara, undertaken with a view to establishing a mission in their territory, describes them as warlike and lawless, like the Massai to the north and the Masitu to the west. Their land is between Lake Nyassa and the coast. The height of the mountains where the Rovuma has its sources was estimated by the bishop at 1,700 metres.

The German and English governments have at length come to an agreement respecting the boundaries of the territory in Eastern Africa under their influence, and of the Sultanate of Zanzibar. Following are in substance the specifications:

1. Germany and Great Britain recognize the sovereignty of the Sultan of Zanzibar over the islands of Zanzibar and Pemba, and over those smaller islands lying in the vicinity of the former, within a circle of twelve nautical miles, also over the islands Lamu and Mafia. They recognize also as the possession of the sultan a line of coast on the continent, passing from the mouth of the Miniangani river on the south to Kipini on the north. This line begins at the south of the Miniangani, follows its course five nautical miles, and is then extended on the parallel of latitude to the point where it meets the right bank of the Rovuma river, when it crosses that river and extends along its left bank. This strip has a breadth of ten nautical miles, measured by a straight line inward from the coast at the highest water-mark. The northern boundary includes Kau. The governments acknowledge the right of the sultan to the stations Kismajo, Barawa, Merka, and Magadoxo, with land extending inward about ten nautical miles, and Warsheik with five nautical miles.

2. Great Britain agrees to support those negotiations of Germany with the sultan which have in view the leasing of the harbor dues of Dar-es-Salaam and Pangani to the German East African Company, in consideration of an annual payment to the sultan on the part of the company.

3. Both powers agree to make a boundary-line between their respective spheres of influence, as was previously done with the territory on the Gulf of Guinea.

This territory is to be bounded on the south by the Rovuma river and on the north by a line starting from the mouth of the Tana river, and following its course, or that of its tributaries, to the intersection of the equator and the thirty-eighth degree of east longitude, then passing in a straight line to the intersection of the first degree of north latitude with the thirty-seventh degree of east longitude, where the line ends. The line of demarcation shall begin at the mouth of

the Wanga or Umbe river, pass direct to Lake Jipe, along its eastern and northern shores, across the Lumi river, dividing midway the districts of Taveita and Chagga, then along the northern slope of the Kilimandjaro range, and be carried on in a straight line to a point where the first degree of south latitude meets the eastern shore of Victoria Lake. Germany engages to claim no territory north of this line, to assume no protectorate and to make no opposition to the extension of the English influence there; and Great Britain makes the same agreement regarding the territory south of the line.

4. Great Britain will use its influence to forward a friendly agreement concerning the Kilimandjaro territory between the Sultan of Zanzibar and the German East African Company.

5. Both powers recognize as belonging to Witu the coast from Kipini northward to Manda Bay.

6. Germany and Great Britain will conjointly call upon the Sultan of Zanzibar to accede to the general act of the Berlin Conference, the existing rights of his Highness being reserved, according to the specifications of Article I of the act.

7. Germany engages to accede to the declaration made by Great Britain and France, March 10, 1862, regarding the recognition of the independence of the Sultan of Zanzibar.

The private claims of the German East African Company on the territory granted to Great Britain are not affected by this treaty, nor are the acquisitions in Somali Land from Tana to the Gulf of Aden. The German protectorate has heretofore extended only over Useghu, Ukami, Nguru, and Usagara. It is intended to cultivate tobacco, coffee, and cotton in the German territory, and a "Plantation Company" with a large capital has been founded for the purpose. A survey for a railway is soon to be begun.

Germany thus becomes the next neighbor of Portugal on the coast, and a treaty has been made with this power also regarding boundaries. According to this treaty the southern boundary of Angola is marked by the course of the Kunene from its mouth to the second cataract in the Chella or Kanna mountains; thence by the parallel of latitude of the falls to the Kubango; thence by the course of that stream to Andara; then by a straight line to the Zambezi at the Rapids of Katina. The northern boundary of Mozambique is marked by the course of the Rovuma to its junction with the Msanje; thence by the parallel of latitude to Nyassa.

Letters from Lake Tanganyika can now reach England in about three months, the London Missionary Society having established a monthly mail from the lake to Zanzibar.

In the early days of July, Dr. Hans Meyer made the first ascent of Kibo, the westerly and highest peak of Mount Kilimandjaro from the southeast, accompanied for most of the distance by Herr von Eberstein. Passing the highest points reached by Johnston and Count Teleki, he climbed to an immense field strewn with broken ice-blocks, and found himself confronted by a blue wall of ice from thirty-five to forty metres in height, presumably the outer wall of the crater. This barrier is impassable to a single climber without apparatus or help

of any kind, and Dr. Meyer had to content himself with the satisfaction of having reached what should be the edge of the crater without the privilege of looking into it. He thinks it altogether probable that the glacier fills it entirely. Observation showed that the wall of ice surrounds it on the northeast as well as the east and south sides. Dr. Meyer found to his regret afterward that the north side of the mountain was almost entirely free from the snow which stretched in great fields over the route traversed by him and his companion, and added greatly to the hardships of the ascent. The height reached was about 6,050 metres.

The political changes in the lands to the south of Abyssinia have led to several journeys of exploration in the interest of trade and plans for opening the best routes of communication. M. Rimbaud, a French merchant, has made a report of a new and direct route which he followed in returning to Harrar from Entotto. He does not, however, share the views of some earlier travelers as to the commercial value of this region, and doubts whether the railroad which has been planned to Lake Assal for transporting salt, will not meet with such great engineering difficulties as to render it an unprofitable enterprise; neither does he believe in the possibility of navigating the Hawash, even at the season of highest water. He recommends the route from Sela by way of Harrar to Shoa, because it avoids the lands of the lawless Danakil and passes through the more fertile regions to the southward. The country of the Itu-Galla is a plateau about 2,500 metres high, covered with fine pastures and great forests, and is well adapted to European colonization by its fertility and the mildness of its climate.

Italy is gradually extending her sway along the African coast of the Red Sea. She has full possession of the colony on Assab Bay, which was extended northward to Cape Dermah by the annexing of Beilul and Gobbi in 1884. The southern boundary is not definitely settled, but includes the sultanate of Raheita. The stretch of coast from Cape Dermah in the south to the Buri peninsula in the north is under the Italian protectorate, and the Dahlak Islands and the vicinity of Massuah from the Buri peninsula to Emberemi north from Massuah are under Italy's control.

Lake Suai, in the southern part of Shoa, has been supposed to be without an outlet; but it has been visited by Count Antonelli and Dr. Traversi, who discovered an outlet from the southern shore. It is called Shushuki, and after forming some smaller lakes it flows into Lake Ocach, and leaving that makes its way to the Bilate, a tributary of the Wabi.

L. Robecchi, an Italian engineer, explored the northeastern part of the Libyan Desert in an adventurous journey begun in the autumn of 1886. The route taken, from Alexandria along the coast to Ras-el-Kanais and over the oasis Garah to Siwah, was not new; but it is

said to have afforded some data that will be of use in perfecting the map of that region. Robecchi entered at night the old necropolis of Siwah, and carried away a number of skulls and skeletons. The people of Siwah are fiercely hostile toward Europeans.

A great part of the western Sahara has passed under the Spanish protectorate, and by a government order in the spring that strip of territory along the coast from near Cape Blanco to Cape Bojador, that is, from 20° 51' north latitude and 10° 56' east longitude to 26° 8' north latitude and 8° 17' east longitude, is placed under the general government of the Canary Islands. The governor will have his capital at Rio del Oro.

A French explorer, C. Douls, gives an account of a remarkable journey made by him in the western Sahara. Disguised as a Mussulman, he landed in a Canary Island fishing-boat at a point on the coast between Cape Bojador and the Rio del Oro. He was suspected and taken prisoner by the first Moors he met, but after some time succeeded in gaining their confidence, and was admitted into their tribe as a "brother." They proved to be a noted robber-band of the Sahara called the Ulad Delim. M. Douls wandered with them five months, going as far as the border of the Desert of Uarau and Djuf, the great depression of the Sahara, making some important observations with his barometer, which, with his compass, had been given back to him by the Moors. Turning to the north he passed near the sebka of Zemmur, determining its exact position and surveying the course of the Saguia-al-Hamra, which had not before been ascended. At the end of March he was in Tendûf, the great slave-market. Since Dr. Lenz was there in 1880, the oasis, according to this account, has greatly increased in size. Returning, he crossed the plains of the Ketana and the Takua. Between Tarfaya and Uad Nun the level surface of the desert becomes broken and hilly, and the beds of rivers that have been destroyed by upheavals can be traced. At Glimin he parted from his companions, they passing on south along the steppes, and he north along the Atlas range. Passing the country of the Berbers, and crossing the Atlas, he reached Morocco. Here the sultan, enraged at having his country entered from the south by a European, threw him into a dungeon. But the English embassy, as it happened, reached the city the same day, and upon the representations of Sir Kirby Green the traveler was released. M. Douls has thus traversed a tract of country new to Europeans, and reports that he has brought away important geographical and ethnological information.

Lieut.-Col. Gallieni has sent to Paris a sketch of the work of the French expeditions to the interior of Senegal. The two military columns moved against the marabout Mahmadu Lamine at Diana, who was threatening the forts on the Senegal, and put him speedily to flight. They made surveys of the valley of the Nieriko, the

upper Gambia, and the hitherto unexplored parts of the Faleme. Two companies of officers had quitted Diana; one had surveyed the country between the Faleme and the Tankesso, the other had crossed the Gambia at Badu and the Faleme at Erimina, and had penetrated to Dinguiray, which has never before been visited by a European. The whole region has been placed under the protectorate of France. A most advantageous treaty has been made with the Prophet Samory, who founded an extended empire, Wassulu, in the upper regions of the Niger, from the ruins of Sego and other conquered territory. By the treaty the Niger and the Tankesso from their sources constitute the boundary between the French Soudan and the territory of Samory, who also agreed to place all his possessions on the right bank of the Niger under French protection. This extends the French influence on the right bank of the Niger from Sego to Sierra Leone and the republic of Liberia.

G. A. Krause returned in September from Salaga to the coast after encountering many hardships on the route, the greater part of which has never before been traveled by a European. In going from Sôgêde to the slave coast, he turned to the south and went to Atakpame by way of Beletá or Anguinga, the center of the salt trade in that region, passing twice by boat over the Mono, called the Njêle in the north, and fording its western tributary, Angai or Anai, three times. In Beletá and in Gbeschi opposition was made to his farther progress, and though he saved himself both times by escaping during the night, he was obliged to leave behind at Beletá his baggage and his collections, the latter consisting of from 600 to 800 plants and seeds of various kinds, a number of beetles, butterflies, and other insects, and a few articles from prehistoric settlements between Mosi and Timbuctoo. He discovered in the land of the Gurunsi a remedy for fever which proved efficacious in the thirteen attacks that he suffered after leaving Salaga. He arrived at Accra September 28, having traveled on foot from Little Popo along the strand.

One important result of his journey is the discovery that the Volta rises far inland, northeast of Waga-Dugu, the capital of Mosi. He found also that Timbuctoo had acknowledged the sovereignty of the Sheik Tidshani, although the troops of El Bakai are still in the field against him. Following is a translation of a part of one of Herr Krause's letters: "I left Salaga July 7, 1886, to go to Mosi. The route led by way of the Dagamba city of Kankanga to Wala-Wala, near which we crossed the Volta and entered the eastern part of the country of the tribes called the Gurunsi. After crossing a large tributary of the eastern Volta we entered the land of the Busanga, and then Mosi, where we spent a month in Beri before we went on to Waga-Dugu, the capital. Leaving that place October 26, and passing through

the Mosi provinces Tema and Jädega, I arrived at Ban, the first place in the domain of the Sheik Tidshani, a son of that Hadsh Omar who fought so obstinately against the French on the Senegal thirty or more years ago. From Ban I went, November 15, to Duënsa, a depot for the salt trade. Before continuing my journey northward, I crossed a high table-land southwesterly to Ban-Djägara, the seat of the Sheik Tidshani. After two days' sojourn, I was ordered out of the town, but received permission to go to Timbuctoo under the Sheik's protection, though through the dangerous region to the east of the Niger. I returned to Duënsa and started from there for Timbuctoo, but after one day's march received an order, December 8, to go back to Mosi. From Mosi I turned to the southwest and south by way of Sinsani Gasári in the western territory of the Gurunsi, Funsi, Wa, and Bole, to Kuntampo in northern Ashantee. This was March 80. I had previously crossed the western Volta. From Kuntampo, eight marches brought me to Salaga. As my goods were exhausted, I was obliged to return. If I could have had from 400 to 600 marks I could have gone on with my explorations."

The territory on the lower Congo, secured to Portugal by the treaty of February 14, 1885, with the Congo State and the confirmation by the Berlin Conference, has been united with the colony of Angola as the Fourth Congo District, and is divided into five sub-districts: Oaongo with the capital Landana, and Cabinda, Ambrizette, San Antonio, and San Salvador, with capitals of the same names.

The Swedish traveler, Baron von Scherwin, has discovered the celebrated Pedra Padrao or inscribed stone, which the Portuguese navigator Diego Cão (Cam) placed at the mouth of the Congo when he discovered it. The baron learned that the natives had been heard to speak of a large "fetich stone" hidden in the jungle. They stood so in awe of it that it was with some difficulty that he persuaded them to show him the way to it. It proved to be the veritable Pedra Padrao.

In reference to the voyages of Diego Cão, the Visconde de Sanches de Baena has been led by an examination of unpublished documents to the conclusion that he started on his first voyage in 1482 and remained away nineteen months, and that it was during this voyage that he set up the Pedra Padrao. After his return he was granted a coat of arms, the patent of which is dated April 14, 1484. He started on a second voyage in 1485 and erected similar stones on Cape Agostinho and Cape Cross. This differs from former accounts.

Dr. H. Schinz, the Swiss botanist, made a two years' journey, from October, 1884, to October, 1886, over the German territory in Southwestern Africa. His reports are of importance as showing the extent and quality of the arable lands, and his careful ethnological researches are also of interest. He estimates

the number of inhabitants under the German protectorate at 250,000, about 10,000 in Great Namaqualand, 120,000 in Ovaherero, and 120,000 in Ovambo. His observation of Lake Ngami convinced him that the surface of the lake is yearly decreasing.

It is proposed to change the name of the Bay of Angra Pequena to Lüderitz Bay, in memory of Adolph Lüderitz, to whose exertions the colonization movement in Southwestern Africa in 1884 is due, and who lost his life in October, 1886, on his way back from a journey made for the purpose of examining the obstructions to navigation in Orange river. His memory is already honored in the colony by the name Lüderitz Land, which is applied to the stretch of coast between Angra Pequena and the mouth of the Orange.

The New Republic founded by the Boers from the Transvaal, in Zululand, includes, according to the statement of the ministry in Parliament, May 17, 1887, 2,854 square miles (English), or 7,392 square kilometres, a much smaller area than was at first claimed. The republic also failed to secure the direct connection with the sea-coast, which was one of the subjects of negotiation. The remaining part of Zululand, 8,220 square miles, or 21,290 square kilometres, falls under the control of England, and is placed under the administration of the Governor of Natal.

The last census (1886) of the Transvaal gives the native population at 299,748, 62,826 of whom are full-grown men. There is a striking difference between these figures and those of the census of 1879, which gave the native population as 774,980, of whom 154,986 were grown men, a difference not accounted for by the fact that one district was not numbered and one other but incompletely. The white population, according to a church census or estimate, numbers 45,000 adherents of the Dutch churches and about 10,000 belonging to other churches, without counting the fluctuating population of the gold-mining districts.

The first section of the railroad from Delagoa Bay to the South African Republic, 86 kilometres in length, was opened October 31. This is the first step toward making the republic of the Boers independent of Great Britain and her South African colonies.

Asia.—The explorations of this year in Asia are mostly due to Russian and British officers, some of whom have been engaged in defining boundaries, and some in examining the resources of the territory lately acquired and the prospects it offers for business enterprises. Several French explorers have also been in the field, and three of them have made the difficult journey across the Pamir. The French authorities in Cochin-China are improving their possessions by opening the Mekong for navigation. They have already succeeded in removing the rocks causing the rapids between Sam-
bor and Stung-trang, so that the stream can be ascended to the Siamese borders.

Dr. G. J. Radde, Director of the Caucasus Museum and the public library at Tiflis, has published this year his report of the expedition undertaken last year (1886) for the exploration of the Trans-Caspian lands recently acquired by Russia, and the adjoining territory of northern Khorassan, under the auspices of the Russian authorities. The objects of the expedition, which lasted eight months, were: the study of the general physico-geographical conditions of the southwestern part of the former Aral-Caspian basin and the isolated mountains rising from it and connected mountain chains; the study of the geological formations in their general character and in the special features that may be of use in future mining undertakings, such as deposits of salt, sulphur, and naphtha; and the study of the fauna and flora with the gathering of collections for future study. The principal members of the expedition were Dr. Radde, Dr. A. Walker, and A. M. Konschin, an engineer who is well acquainted with the country, having been engaged in mining operations there since 1881, and who has given considerable study to the Oxus question. Many deposits of naphtha, saltpetre, common salt, sulphur, gypsum, Glauber's-salt, and the like have been discovered by him in his various tours, in which he estimates that he has traveled in all about 8,500 kilometres. The Trans-Caspian naphtha-fields lie in the sandy depression at the foot of the Balkan mountains, 80 kilometres west of the stations Bala-ischem and Aidin on the Trans-Caspian railway. The naphtha-bearing hills, of which there are two groups, the Naphthadagh and the Buja-dagh, are made up of salty, parti-colored clays and marls, saturated with the naphtha and covered with coarse and fine sand, having a stratified form and also filled with naphtha. As to the value of this product in future, Herr Konschin does not think that its export in either crude or distilled form will ever be profitable. But he thinks it promises to be of great service as fuel for the railroad and the country, which is wholly destitute of forests and of coal. Naphtha is also found on the island of Cheleken, and traces of it have been noticed at Chikishlijar and on the mountains of Kelat.

A rich deposit of sulphur was found in the midst of the Desert of Karakum in numerous groups of rounded hills. The place is called by the natives Kyrk-dsuhulba, meaning "forty hills." The sulphur, which is in masses and veins amid strata of marl, clay, and sand, is of excellent quality, and in spite of its remote position is worthy the attention of those interested in the sulphur-trade. The railway is at least 200 kilometres distant. The other minerals named exist in good quality and abundance. Great quantities of salt are found along the Caspian on its ancient bed; and the deposits near Akrabad, not far from the Afghan border, supply the inhabitants of the oases of Merv, Pende, and Tejend, as well as those

of the neighboring parts of Afghanistan and Khorassan.

As to the adaptability of the country to agriculture, M. Konschin says scarcely the hundredth part of the surface is fit for cultivation. "All of the remainder bears the typical desolate character of the central Asiatic desert. The greater part of it is covered with vast masses of sand in monotonous wave-like forms. Here and there the sand-hills alternate with bare clay-fields or barren, salt-bearing basins and dried-up lagoon-beds. These three, the salt hills, clay-beds, and dry valleys of salt and gypsum, are the typical features of the physiognomy of Turkomania. Unattractive as the country is, it is of great interest to the geologist. Here must be decided the questions raised by Pallas and Humboldt regarding the history of the ancient Pontic-Aral-Caspian Sea and its division into three great basins, now represented by the Caspian, the Aral, and the Black seas. Was the change made gradually under the influence of dry polar winds, or by an upheaval of the earth's surface causing a sudden outflow of the waters, according to Baer's theory, or were there upheavals at some points with corresponding simultaneous depressions at others, causing the water to settle in the smaller and deeper basins? Here also is the question as to what is called the old beds of the Amu-Darja, known as the Usboi, Ungus, Aktama, etc., all of which traverse the plain between the present Amu and the Caspian Sea. This question is not only of interest to scientists, but its practical importance was recognized even by Peter the Great, and is seen by the Russian Government to-day. The question is whether the Amu-Darja can again be connected with the Caspian, a question of great moment to Russia, politically as well as commercially."

M. Konschin's conclusion is that the dried-up lakes, gulfs, etc., the principal series of which intersects the Karakum steppe from northwest to southeast, are only an ancient shore-line of the Caspian, and not an old bed of the Amu-darja. The Sarakamysh basin when filled with water was in connection with the Aral by means of the Gulf of Abougir and with the Caspian by the Balkan Gulf, and into the basin flowed the Amu-darja from the southeast. The final connection between the Aral and the Caspian was by means of the depression of the western Usboi extending along the Ust-Urt and the Great Balkan. The Usboi, therefore, was not a continuation of the Amu-darja or an old bed of the Oxus. The clear salt water of the Usboi can not be traced to the muddy fresh water of the Amu-darja, and the lack of cut-offs from the latter in the depressed plain of Turkomania and of every trace of life forbids the supposition that it was ever connected with the Caspian in its present limits. The presence of salt in large quantities is a further proof of this view, and traces of the action of flowing water, such as rounded

pebbles, pebbly sand, the washing away of banks and the like, are scarcely to be found. Another proof is afforded by the discovery of important traces of the action of marine ice in this depression—a very rare phenomenon in Central Asia.

As to the practical question involved, M. Konsolin says: "In order to pass around the Sarakamysh basin from the Amu-darja toward Bala-ischem to the Ust-Urt it would be necessary to construct a canal of at least 800 kilometres through a region of large sand-hills and partly through rock. But to fill the basin again with water seems to me an undertaking not to be thought of, as it would be to form a sea in a place where it would be subjected to the powerful geological agencies there active. Neither would the western Usboi in its present condition, even at high water, afford ship-passage to it. A series of canals would have to be constructed through the Balkan plain, as well as through the swampy tract at Babachodsha, and at other points costly hydrotechnic machinery would be needed. The cost of the undertaking would be out of proportion to the advantages Russia would be likely to gain by this connection with Central Asia.

"In conclusion, it remains to devote a few words to the question: What causes effected the drying up of the Turkomanian plain? In my opinion two causes contributed: first, the action of polar winds; and, second, the upheaval of the earth.

"The latter is evidenced by, first, the high altitude of the more recent Pliocene strata in the ravines of the Kioren-dagh; second, the hooked form of the peninsulas of Krasnovolsk and Darshe, of the island of Cheleken, which is on the way to becoming a peninsula, and of the Great Balkan, which was a peninsula; third, the hooked and finger-form of numerous tongues of land on the northern and western shores of the peninsula Darshe, as on the neighboring shore of the Caspian; fourth, the long, narrow coast-lakes that line the shore of the Caspian between the Khiva and Chikishliar bays; fifth, the many narrow lagoon-beds running parallel to the length of the oasis of Akaltekke and to the Kioren and Kopet-dagh ranges; sixth, the peculiarity of the mouths of the Atrek and Gurgan rivers, showing great marshy stretches, bays, and numerous channels; seventh, the many remains of marine organisms and traces of the dynamic and static action of the sea at elevations considerably above the present sea-level.

"As to the action of polar winds, the effect of the north and northeast winds in Turkomania is well known. They are like powerful pumps continually acting to draw the moisture from the soil and carrying it from east to west. So few showers fall during the warm season that constant diminution of the water would be inevitable.

"From all these considerations it appears that the country is condemned to bear the

character of a desolate waste. Nature has given to it only a cloudless sky, barren mountains, rivers without water, clouds of dust and sand, and dead plains of salt."

The boundary between the Russian possessions in Asia and Afghanistan has been settled after three years of negotiation, by a treaty concluded July 22 at St. Petersburg and ratified August 8. Herr H. Wichmann gives an account of the difficulties and the progress of the agreement substantially as follows: As long ago as 1878, England and Russia, whose leading statesmen were convinced of the undesirability of having their possessions meet in Asia, made provisional agreement to maintain the territory of Afghanistan as it then stood, giving that state the position of a bulwark between the two powers. The Amu-darja from the mouth of the Koktsha to Khodsha-Salih was designated as the northern boundary of Afghanistan; the line from there to the Persian borders was not settled, but the districts of Aktscha, Seripul, Maimeneh, Shibagan, and Andkhoi were recognized as belonging to Afghanistan. The western boundary also was left undefined, as this was premised to be already known. There was no anxiety in England about the northwestern boundary, as at that time there was no indication that Russia would advance from that side through the territory of the Turkoman tribes and the Desert of Karakum.

It was not till after the lapse of ten years and more that it became apparent that very little was known of the real extent of the Afghan empire, and that the boundaries laid down so long on the maps between Sarakhs and the Oxus had been drawn at random, without any credible information about the tribes subject to Afghanistan and those that were independent. The question was again agitated in 1881, but nothing came of it. It became more pressing after the surrender of Merv in March, 1885, when the Turkoman tribes, even those most remote, the Sarik Turkomans, who had their pasture-grounds along the middle course of the Murghab and on the lower Kushk, voluntarily subjected themselves to Russia; for this made it evident that Afghan sovereignty did not extend over the territory between the rivers Tejend and Murghab.

The negotiations, taken up again in March, 1884, were delayed, after the appointment of a mixed commission, by the demand on the part of Russia that an understanding should first be had as to the starting-place of the Afghan boundary from Persia, the place of crossing the Murghab, and the direction it should take to the Amu-darja. These questions were settled Sept. 10, 1885, and the commission began its work in November at Zulfiqar on the Heri-Rud, the upper course of the Tejend, which forms the boundary between Persia and Russian Turkistan to a little north of Sarakhs. No difficulties were experienced until the question arose as to the ending of the line at the

Oxus. By the agreement of January 31, 1873, the post at Kodsha-Salih had been designated as the most westerly point of Afghanistan. It now appeared that the actual boundary between Bokhara and Afghanistan at the left bank of the Oxus, as it had stood for thirty-six years, took an entirely different course than had been supposed, since it passed between the village of Bossága in Bokhara and the Afghan town of Khamiab. Another difficulty was presented by the fact that there was no town called Kodsha-Salih; the place having most claim to the appellation is the tomb of a Mohammedan saint, called Ziaret Kodsha-Salih. The largest of the four Afghan districts between Bossága and Kilif, Karkin, is frequently called Kodsha-Salih. As the commission could not agree on this point, the governments decided in August, 1886, to declare its work ended, and decide by direct negotiation the terminal of the Afghan boundary at the Oxus.

The matter was resumed in April, 1887, at St. Petersburg. On the side of England it was insisted that the agreement of 1873 had for its object only the maintenance of the then position of the Emir of Afghanistan; and therefore it would be fair not to insist on a boundary drawn in ignorance of some of the facts, but to allow to Afghanistan the whole territory of Khamiab. On the part of Russia it was urged that this principle of the recognition of the boundary of Afghanistan in 1873 was already broken by the treaty of September, 1885, which gave lands on the upper Kushk, the Kashan, and the Murghab, to the Emir of Afghanistan, which had undoubtedly before been the property of the independent tribes of the oasis of Pendjeh.

After tedious debates an understanding was reached by which Russia allowed to Afghanistan the disputed territory on the Oxus, the district of Khamiab, and received in exchange the districts on the Kushk, Kashan, and Murghab previously accorded to Afghanistan. By this arrangement the latter country received about 784 square miles of which 26½ square miles are farming-lands, with about 18,000 inhabitants, while the Turkomans received 824½ square miles of which 6½ square miles are farming-lands, and only 14 square miles are arable.

Great gain to geographical knowledge has resulted from the work of the Russian and British surveyors, who were engaged during the delay in 1885 and 1886 in a thorough examination of great tracts in Central Asia long practically closed to European travelers. The Russian surveyors worked upon the lands of the former independent tribes, the borders toward Persia and the Oxus. The British engineers laid down upon the map a surface of about 120,000 square miles. They measured, besides the new borders, the entire province of Herat, including the heretofore unknown districts of Taimani and Firzkuhi. Almost the whole of Afghan Turkistan, and a great part of Hazareh land in the vicinity of Bamian,

has been surveyed or at least examined, as well as the Persian province of Khorassan.

The source of the Heri-Rud proved to be at an elevation of 12,000 feet above the level of the sea; it flows 70 or 80 miles under the name of the Ab-i-Sar-i-jangal to Danlalyar, almost due west, and in a direction different from that laid down on the maps. The Chalopdalan or Chahil Abdak peak in Imam Sherif's journey through the Taimani country, was identified, a solitary mountain 12,000 feet high, said to be the Takht of Zohak-i-Maran, the snake-bearing governor of these provinces in the days of Ghur; and it was from here that he built the massive walls and towers of the old forts which surround Taiwara and border the road to Ghur.

The Pamir has been crossed this year by the French travelers MM. Capus, Bonvalot, and Pépin. They were robbed on the way, but succeeded in crossing the Pamir and the Hindu Kush between Samarcand and Chitral, whither help was sent to them from India. Grum Greshimalo also made his third journey to the Pamir, starting this time from Fergana.

In an address before the Royal Geographical Society by E. D. Morgan, giving an account of Gen. Prejevalski's journeys in Central Asia, the following details, with reference to the eastern part of the journey, were specified as having been given to the speaker by the explorer: First, the changes to be made in existing maps are, "(1) the Khoten river makes no bend to the west, but has a nearly meridional course from south to north (our itinerary from Khoten to the confluence of the Khoten-darja with the Tarim measures 327 miles); (2) there is no such lake as Yashil-kul, nor any lakes along the course of the Khoten-darja; (3) thirty miles below the fork of the Kara-Kash and Khoten rivers, a low, narrow, and absolutely barren ridge, having an elevation of only 500 feet, stretches from Fort Maral-bashi in this direction, that is, northeast toward the Khoten-darja."

Further details were: "Forty-three miles below Khoten, following the Khoten-darja, otherwise known as the Yurun-Kash, lies the oasis of Tavek-Kehl, inhabited by about 500 families, not marked on any map. According to native information, the population of the Khoten oasis (including Khoten, Kara-Kash, and Sam-pul) numbers 600,000. In September the Khoten river is an insignificant stream, 70 to 100 feet wide, and from six inches to one foot in depth. After a devious course of seventeen miles below Mazartagh ridge it dries up, only leaving pools here and there along its sandy bed. In summer, however, there is an abundance of water, and the river then reaches the Tarim.

On either side of the Khoten river are drift-sands the whole way from Khoten to the Tarim. The valley of the former river is about three miles wide, and indistinctly defined; on the lower river there are no inhabitants. The

flora and fauna are extremely poor. Khoten has an elevation of 4,100 feet, and the confluence of the Khoten and the Tarim 2,800, twelve miles below the junction of the Yarkand and Aksu darjas. Here the Tarim has a width of about 200 yards at low water, and a depth of not less than five feet. The whole of the Tarim is navigable for small river-steamers from the confluence of its upper waters to Lob Nor. The first inhabited parts of the Aksu oasis occur on the left bank of its river, eighteen miles from the ford across the Tarim, coming from Khoten, and it is exactly sixty-six miles farther to the town of Aksu. The Aksu oasis has a population of 56,000 families, according to native information, and is the most fertile part of Kashgaria.

Some parts of Thibet not explored by Gen. Prejevalski, seem to have been visited by Mr. A. D. Carey, of the Bombay civil service, who is making a two years' journey through that part of Asia, accompanied by Mr. A. Dalgleish as interpreter. They left India in May, 1885, and marched through the hills to Ladak. The plan was to travel eastward into Northern Thibet as far as the Mangtsa lake, and then turning northward to go on to the plains of Turkistan near Kiria. In carrying out this plan the travelers passed over more than 300 miles believed not to have been previously visited by Europeans. The height of one of the passes crossed was estimated at 19,000 feet. From Khoten the Khoten river was followed to its junction with the Tarim, then that river to Sarik, and from there the travelers crossed the desert to Sháh-yár and Kuchar. Thence the Tarim was followed to a point where it turns southward to Lake Lob, and after some delay the travelers followed it on to the lake, thus exploring its entire course.

The country about is flat and reedy, and the people are poor and destitute. Mr. Carey was everywhere kindly received—a contrast to the treatment encountered by Gen. Prejevalski. After leaving Lob Nor in April, 1886, he crossed the Altyn and Chiman mountains, and reached the foot of a high chain supposed to be the true Kuen-Lun. To the eastward a pass was found leading to the valley of the Machu, the head source of the Yang-tse-kiang. Want of supplies prevented the travelers from following the Machu very far. In the subsequent journey they saw a good deal of the nomadic Kalnuks and Mongols in the valleys of Tsaidam. Though rather inhospitable, they were not hostile; they often refused to part with food or grain for money. On the way from Chaklik to the point where the Shassa track was struck, a journey of eighty-two days, not a single human being was met with.

Several journeys, undertaken by native explorers to solve the problems of the Sanpo and Lut-se-kiang, have been unsuccessful; but it seems probable from what is known that the Sanpo flows into the Brahmaputra, and that the Lut-se-kiang is the upper part of the Irra-

wadi. Col. Woodthorpe has been busied with extensive surveys in Burmah, and Mr. MacCarthy has made some explorations in Siam.

Mr. G. N. Potanin returned to St. Petersburg in the spring after his three years' explorations in Mongolia. At the end of 1886 he crossed the Desert of Gobi to Kiakhta and Irkutak, following the course of the river Ezsin. In its lower part it divides into two streams, the eastern forming the half-dried lake Sugu-nor, while the western flows into the great salt lake Gushun-nor, situated in a desert where neither water nor grass is found for fifty miles. M. Potanin's companion, M. Beresovski, remained behind to increase his already large natural history collection. M. Potanin took home more than 1,500 botanical specimens and 15,000 insects, with photographs and ethnological objects. M. Skassi, a member of the party, surveyed 4,000 miles of country, and determined by astronomical observations the position of more than sixty points.

Three English travelers, Messrs. James, Younghusband, and Fulford, have succeeded in finding the sources of the western Sungari. They started from Mookden for the valley of the Jalu, intending to go to the boundary mountains of Corea and Manchuria. But the way was so difficult that they turned toward the north into a side valley, and, having crossed the mountains by a pass 900 metres high, they followed the He-ho or Black river to the Sungari, the western fork of which they traced to its source in the Peistau or White mountains. The highest point was found to be about 2,500 metres; it has heretofore been estimated at from 3,000 to 4,000. There are no glaciers, but the snow lies in the ravines throughout the year. Near by are the sources of the Jalu and the Tumen, the river on the border of Corea. They attempted to reach it, but finding the mountains impassable turned northward to Kirin, the capital of Chinese Manchuria. They afterward traveled through northern and eastern Manchuria, their whole journey extending over more than 3,000 miles. They found the people civil and kind, but the country is overrun with brigands. The administration is too weak to maintain an efficient police system, and probably order can only be introduced by Chinese authority. The Manchu Tartars are fast losing their language, spoken and written, and adopting the Chinese. This substitution of a complicated hieroglyphic system for a simple alphabet forms an instance of national retrogression unparalleled in modern times. The people, say the travelers, are demoralized with idleness; for every man belonging to the higher classes that can draw a bow receives two taels a month, and land rent free, as compensation for training with the militia twice a year. The country is rich in gold, silver, iron, coal, furs, and silk. Large quantities of opium are raised, which find a market in China.

The English Government has given up its

claim to the little islands near Corea which were to be used as a marine station—Port Hamilton—they having been found unsuitable for the purpose.

Several attempts to sound the depth of the crater of the volcano of Asama-jama north-west of Tokio were made by Mr. Milne some time since. One hundred feet from the edge of the crater the lead reached a depth of 441 feet; at 800 feet from the edge the lead descended more than 700 feet, when the attempt had to be given up on account of the breaking of the line.

In a report to the Geographical Society of Paris, Joseph Martin, the French mining engineer, describes his journeys in Eastern Siberia. He crossed the Stanowoi mountains, a route never before taken by scientific explorers. He was obliged to give up his first plan to cross this watershed between the Lena and Amoor by the two tributaries Aldan and Zea, and to pass again over the watershed between Olekma and Witim, and then the parallel chains of the Stanowoi between the Tungir and Amassar. In this south-western part the range presents rounded summits covered with forests mostly of larches and birches; its average height is 1,200 metres, while single points rise as high as 1,500 metres.

An attempt made by M. Sibiriakoff to send his steamer "Nordenskiöld" to the Yenesei this autumn, by way of the Kara Sea, was unsuccessful. The vessel encountered much drift-ice and fog, but reached the mouth of the Petchora, where it secured a cargo, and returned to Bremen after a voyage of sixteen days. Another vessel, the "Phoenix," in charge of Captain Wiggins, reached and entered the Yenesei after a voyage of about six weeks, the first since 1880.

Australia.—The central desert of Australia is gradually becoming available for pasture-land, as the geography of the country is better understood. Water is conveyed by ditches, and great tracts from which travelers have heretofore been shut out by the want of water are found capable of sustaining vast herds of cattle.

W. J. O'Donnell has found a new route to the Derby gold-fields by the Ord river from West Australia. He discovered a pass through the Leopold II mountains near Mount Leake, whereby the long circuit by way of the Margaret river can be avoided.

The Melbourne section of the geographical society of Australia is planning an expedition into the west Australian desert under the leadership of E. Giles, to penetrate in a north-westerly direction from Lake Amadeus, and cross the unknown portion of the continent.

In an account of his expedition through Central Australia from Lake Nash to the border of Queensland, David Lindsay describes the region traversed as a high table-land, bordered on the south by sandy plains and on the north by the coast mountains; large tracts of it are covered with nutritious grass. In the rainy

season it is crossed by the Playford, Buchanan, and other rivers, flowing westward; in the dry season they are lost in the depressions that stretch eastward from the Ashburton range. Water can be conveyed to all parts, and Mr. Lindsay believes that the whole plateau can be made available for sheep-raising. An important discovery made by Mr. Lindsay in the McDonnell mountains has drawn there a crowd of adventurers and caused the formation of a mining company in Adelaide. This is the discovery of rubies and garnets. R. Pearson, who made a journey to the place for further search, returned in July with a box of the stones taken from a slight depth at Barrow Creek during the space of a fortnight.

Islands.—An expedition left Sydney in the spring, under the leadership of Theodore F. Bevan, to explore some parts of New Guinea, and met with good success, three new rivers being discovered. Mr. Bevan's ship, the "Victory," entered the Aird river, discovered by Joseph Blackwood in 1845, and, sailing up it, found it to be only one of many subdivisions in the delta of a large river, navigable to the mountains. This was named Douglas river, and a large tributary was called Philip river. Returning, the steamer followed another of the arms of the river to Deception Bay. Near Bald Head, the eastern promontory of this bay, a third large stream was found, and followed a distance of 110 miles, when it became too shallow for farther progress. It was called the Queen's Jubilee, or Jubilee river. It was found to be bordered with forests seemingly uninhabited. The Stanhope river forms a common estuary with the Queen's Jubilee, west of Bald Head, and is navigable for a distance of forty miles. The many branchings of the Queen's Jubilee indicate that this part of the island is a great delta.

Of the people encountered Mr. Bevan writes: "The natives of the few villages found gave indications of Dravidian origin, as well as of both Moluccan and Melanesian characteristics, by dialect, appearance, and customs. From a new tribe beyond Aird Hills, a long screen of lattice-work was obtained, like those used in Siam for stretching across the mouths of creeks to ensnare fish. New Guineans likewise use it to form a weir. The war-shields of the Kiva Pori natives resembled not indistinctly those used till lately in New Caledonia. All these tribes wore nose-pencils and distended the lobes of their ears. They smoked sundried tobacco (corresponding to the manila leaf) by means of bamboo tubes. The Tumans, especially, might be described as almost of an intellectual cast. The canoes were dug-outs, with either a bank of mud or a small boy squatting in the prow and opposing his back as an obstacle to the incoming water. All were without outriggers. Some, however, were of unusual dimensions, one Kiva Pori canoe holding twenty-nine men, who all stood up to paddle. Not a few were grotesquely

carved and painted outside to represent either inverted turtle-shells or crocodile scales. We were not a little amused at the action of one Moko native, who singly, in his fragile canoe, baled the water out by a motion of his left foot, keeping his balance and paddling vigorously against the choppy sea meanwhile."

The Baron von Schleinitz, in a voyage to the Huon Gulf in New Guinea, made the discovery of eight harbors and nine rivers not heretofore laid down on the maps. He could not ascend the rivers, but he found reason to suppose that some of them, in particular the Markham river, would afford means for exploring the interior, as its broad valley stretches far inland between high mountains. The rocks on the southern coast are primitive and metamorphic, with older sedimentary and volcanic formations; a fact which indicates greater accessibility to the interior, because erosion does not make the harder rocks so broken and impassable as the chalk formations in the vicinity of Finch Bay and other parts of Kaiser Wilhelm's Land. Another voyage was devoted to the coast, from Astrolabe Bay to the mouth of Augusta river, and led to the discovery of many bays, harbors, islands, and rivers not upon the maps, as well as the gathering of information about the country, which will be of value in making plans for its cultivation.

The baron measured 140 nautical miles in Kaiser Wilhelm's Land, and 110 in New Pomerania (New Britain) and Rook Island, and laid down many good harbors and anchoring places. In New Pomerania a low plain of great extent was discovered, having a fertile soil, and traversed by navigable streams. Its area was estimated at 4,000 square kilometres.

The coast between Juno Island and Cape Croisilles was visited in April and May by Dr. Schrader's scientific expedition, to which the discovery of the Empress Augusta river is due. Though lacking in harbors, the region seemed worth cultivating, the land being fertile, and the coast-waters favorable for anchorage.

The Catholic missionaries on Yule Island have discovered, in the course of some excursions to the opposite shore, that the two rivers, Hilda and Ethel, flowing into Hall Sound, are only insignificant streams; but they have found a new and large river, the St. Joseph, rising in Mount Yule and flowing directly southward. In fifteen villages which they visited, the missionaries numbered about 2,000 inhabitants, all of whom seemed very peaceable. They intend to found a new station twenty miles up the river. Dr. Edenfeldt was to accompany them in an ascent of Mount Yule, which is 10,046 feet in height.

Mount Owen Stanley, the highest peak of the range of that name, has at last been ascended by Mr. O. H. Martin, who estimates its height at 18,205 feet. He describes the northern slope of the mountain as a paradise of ferns and palms. The same general character is given to the ridge forming the water-shed be-

tween the south and east coasts by the report of Messrs. Harding and Hunter, who ascended it in the summer. It is from five to six thousand feet high. Mount Obree, 10,240 feet high, was ascended by W. R. Cuthbertson. Pines were growing at heights of 6,000 to 8,000 feet, and rhododendrons at the summit.

In an article in Petermann's "Mittheilungen," Dr. Th. Poschwitz discusses the Kina-balü Lake in Borneo. This lake, described as lying at the foot of the Kina-balü (Chinese woman) mountain on the south or southeast, has been said by some travelers to be a great body of water, while its existence has been doubted and even wholly denied by others since its first reported discovery in 1812. An examination of the various reports leads him to conclude that the Kina-balü is a swampy depression on the middle course of the Libog-Labuk river, which was originally a lake like many of those found along the course of the Barito and other streams of Barito; it appears as a level tract or a marshy lowland, according to the time of year it is observed. It is simply now in the course of transformation from a lake to a dry plain. This view is supported by the name given to it on Hatton's map, *Danaul-Ebene*, that is, lake-plain, presumably taken from the natives, and embodying the history of the lake. The Kina-balü mountain was lately ascended by Mr. H. M. Little, one of the officials of the Borneo Company, who describes it as a huge volcanic mass, and estimates its height at 11,565 feet.

A visit made by Capt. J. Fairchild to the little islands Antipodes and Bounty, near New Zealand, for the purpose of building on them some little huts as refuges for shipwrecked people, gives some interesting information about those islands. Mount Gallavay on the Antipodes is about 400 metres in height, and is apparently of volcanic origin; the level part of the island is covered with grass of poor quality, and is the home of thousands of the albatross. Capt. Fairchild thinks that, if good grass were sown and sheep and goats placed there, they would thrive well. There are no trees either on these or the Bounty islands, which are fourteen in number, and have neither flowing water nor vegetation, not even lichens and mosses. Millions of penguins and other sea-birds make their nests there, so that shipwrecked men could find enough to eat, and the frequent showers would afford water enough for drinking purposes.

The population of New Zealand, according to a census made March 28, 1886, is 578,482, exclusive of Maoris, of whom there are 41,969, and 2,254 half-castes living with them. The number of Chinese was 4,527.

The Caroline Islands have been divided by the Governor-General of the Philippine Islands into two administration districts, the east and west, divided by the 148th degree of east longitude.

By a treaty of Nov. 19, 1886, the little group

of the Uvea or Wallis Islands was placed under French protection. The territory amounts to only about ninety-six square kilometres with about 8,500 inhabitants; but it is of some political value to France, tending to strengthen French influence in the Pacific and forming a link between the French colonies of New Caledonia and Tahiti.

Mons. A. Marche, after two months of exploration in Saipan, one of the Ladrões or Mariana Islands, says the maps are very incorrect. It has been supposed that a volcano, either active or extinct, was situated on the island, but he found none and no trace of volcanic action. Tapachao, the highest peak, he found to be only 1,845 instead of 2,000 feet high. Other hills were not over 600 or 700 feet. The northern part terminates in a mountain looking like the cliffs at Dieppe, and forming a long, narrow plateau.

Europe.—According to a report of the forest department of Russia, the work of draining the swamps in that country has been very successful. During the years 1883 and 1884, 1,580 square kilometres were drained and opened for cultivation between the Dnieper, Pripet, and Beresina, and about 1,100 between the Pripet, Slutch, the lakes Schid, and Domonowitch, and the basin of the Ossipovka. During a space of about ten years after the beginning of the work, 2,025 kilometres of canal were made, and 16,600 square kilometres of land drained. The expense was 1,875,000 roubles. In the government of Riazan 420 kilometres of canals were constructed; in the government of Moscow the canalization of the Dubna was finished; and in the northern governments the work of leveling and examining the land was carried on.

The Government of Roumania has ordered a triangulation of the country, a work which will fill a gap in the cartography of Europe. All the maps of Roumania are based on the observations of the Austrian troops in the year 1855.

Travelers and students are turning their attention of late to the Caucasus, which offers a field for research readily accessible to Europeans. Messrs. Dent and Donkin have recently published a report of a tour made last year in the group of the Kasch-tan-tau. They did not succeed in ascending that mountain, because they could not persuade the natives with them to wait for favorable weather or bring fresh supplies to the foot of the Besingi glacier. But they climbed the Tetnuld-tau under great difficulties, ascertaining its height by aneroid measurement to be about 5,040 metres, or 16,550 feet. Notwithstanding the unfavorable weather, they were able to learn something of the orography of the central Caucasus; they found that the Tetnuld and Totonal are not identical, but neighboring peaks of about equal height.

The Tetnuld was again ascended in August of this year by M. Dechy and Mr. D. Freshfield.

The ascent cost thirteen hours walking from a bivouac of 9,000 feet. The views were clear and glorious. Mr. Freshfield describes Tetnuld as the only one of the great peaks standing out on a short southern spur from the Caucasian water-shed, and therefore most favorable for views. A single observation gave the height as 16,700 feet. Four higher summits, 16,900 to 17,200 feet in height, were close at hand. Of the view from Mount Schoda, 11,128 feet in height, he says: "The glacier and forest scenery is in many parts superb. It would be difficult to imagine a more sublime and fantastic landscape than that of Ushkul, the highest community in Suanetia, when behind its fifty towers and two black castles the frozen ridge of Schkara rises 10,000 feet overhead against an unclouded sky. From the valley of the Scena, or western source of the Zenes Skali, the five crests of the same great mountain recall one of the noblest views in the Alps, Monte Rosa from Val Anzasca, and they are seen over virgin forests and fields and flowers which are high enough to conceal a laden horse."

The travelers say there is no danger or difficulty to encounter in travel in the Caucasus district they visited, the one most interesting to mountaineers, except the delay, as in all countries where time is no object. The completion of a railway to Novorossiisk, which as a port accessible at all seasons is expected to supersede Taganrog, will open a new route next year to the Caucasus.

Prof. A. Penck describes a journey to the Boehmer Wald with two others for the study of the traces of glaciers. He believes that the walls between the lakes are real moraines, as indicated by the glacier cliffs on the Devil's Lake; but outside of the lake region he finds no trace of glacial phenomena.

An examination of the subterranean water-courses in the Karst district of Austria by W. Putik has led to the discovery of several caves of considerable size, among which the Count Falkenhayn Cave is the largest. The practical result expected from this examination is the prevention of overflows by removal of the masses of *débris* hindering the regular drainage; so that in a few years great tracts, now swampy, will be ready for cultivation.

The following are the soundings obtained in the Swiss lakes by a recent survey of the Topographical Department: The Bodensee, greatest depth between Uttwil and Friedrichshafen, 838 feet; Lake Geneva, upper part, between Revaz, St. Gingolph, and Villeneuve, 842 feet; in the center, between Ouchy and Evian, 1,017 feet; Lake Lucerne, between Gersan and Rutenen, 700 feet; Lake Zug, between Walchwill and Immensee, 650 feet; Lake Sempach, between Eich and Nottwell, 286 feet; Lake Baldegg, between Rettschwil and Gölpi, 216 feet.

M. Schrader, who has devoted ten years to the study of the orography of the Pyrenees, gives a report of his researches to the French

Association for the Advancement of Science. He says the latest maps are sixty years old, and full of inaccuracies, and no successful corrections have been made since. He made observations with an instrument of his own invention, which he calls an orograph. The mass of the mountains is south of the boundary-line, the water-shed, and they slope gradually into Spain but descend abruptly into France. On the Spanish side the descent is formed by two stages. Starting from the central crests, we find a sort of plateau, a compound mam-millated surface, twelve to twenty miles wide, of a wild and melancholy aspect, contrasting with the beauty of the great crests. At the limit of this region a new chain rises to a height of 1,000 to 1,600 feet. This long belt of sierra, crossed by narrow river gorges, seems to inclose the mass of the Spanish Pyrenees in a circle of gigantic walls.

In old descriptions the general appearance of the range is compared to a fern-leaf or the dorsal ridge of a fish. But M. Schrader says there are many lines of elevation oblique to the main axis of the chain and generally forming an acute angle with it. Certain regions—for example, that of Mont Perdu—present this conformation with almost geometrical regularity, while others are less marked. One is struck by the regularity of the meshes of the network shown on the map by the valleys and the elevations, broken in places by gorges of streams that pass from one line of elevation to another, and descend at the first opportunity.

On the side of France, the crests are blunted, having been worn away by the humidity of the atmosphere; but on the side of Spain, the features are much more strongly marked. The hot and cold climate has evaporated the moisture, destroyed the lichens, and preserved the primitive and rugged aspect of the rocks.

North America.—The expedition sent out to survey the boundary-line between Alaska and the British possessions, as fixed by the treaty of 1825, has not yet finished its work. As the Yukon could not be followed to the coast before the close of navigation, Dr. G. M. Dawson, the leader, after examining the Pelly river, returned to Chilcat, and his companion, Mr. Ogilvie, went into winter-quarters at Fort Reliance, in order to explore next season the country bordering the Mackenzie to its mouth. Dr. Dawson finds that the tract of country between Cassiar and Forty Mile Creek, a tributary of the Yukon, is rich in gold.

It looks as if the hope of opening a regular summer passage through Hudson strait and bay, and thus establishing connection with Manitoba, must be definitely given up. In Lieut. A. R. Gordon's report of the voyage of the Alert in 1886, published this year, he says that the route is not available for ordinary carrying ships, even when they are made specially strong to resist the ice; for it is in such dangerous masses that no ship, not expressly made for polar voyages, can withstand it.

The census report of Manitoba for July, 1886, shows a reduction of its area from 123,200 to 60,520 square miles since 1881, the remainder having been added to the province of Ontario and the district of Keewatin. On the remaining area the population has increased from 62,260 to 108,640 during the five years.

West Indies.—By a series of careful observations Mr. Hall has determined the height of Blue Mountain Peak, Jamaica, to be 7,423 ft.

South America.—Very many explorers have been at work in South America during the year, some of them sent out by their governments to gain data on which to base a settlement of boundaries, and others by local scientific associations. In Venezuela M. Chaffanjon explored the sources of the Orinoco, following it up from the mouth of the Meta, and giving special attention to the connection between the Orinoco and Amazon by the Cassiquiare. He named the mountains at its source "Ferdinand de Lesseps," although they have long borne the name Serra Parime. A commission is at work to settle the boundary between this country and Brazil. In Guiana the Bureau of Education has again sent out H. Condreau, who has been engaged in exploration affecting the boundary between French Guiana and Brazil. He will examine the Tumucuraque mountains, the water-shed between the coast rivers of Guiana and the Amazon branches.

One of the least known parts of Brazil was visited by an expedition, accompanied by Dr. Hassler. Starting from Ouyabá they crossed the water-shed between the La Plata and Amazon, and passed several streams entering the upper Xingu, and reached the Rio Mortes, the largest western tributary of the Araguay, and, following it to its mouth, took the main stream to the mouth of the Tocantins. The return was made across the table-land from Matto Grosso to the Rio Lourenço.

A journey on the Rio das Velhas, the largest tributary of the upper Rio San Francisco, was made by Dr. P. de Frontin and F. Paranagua. They passed 200 rapids, but believe that a comparatively small amount of labor would be sufficient to remove them, and make the river a convenient route for the province Minas-Geraes, which needs only better facilities for communication to lead to a much greater development of its gold-mines, which have already been worked with good success for more than two centuries. It is also the great diamond-field of Brazil.

Dr. von den Steinen's expedition, though not able to carry out its original plan of exploring the upper valley of the Xingu, employed the time in examining the remains of ancient Indian life in the province of Santa Catharina. A great collection of stone implements, human remains, and the like, together with photographs and drawings, were sent to the Berlin Museum of Ethnography.

Richard Payer, whose three years' work on the Amazon was noted last year, is about to

return to Europe with large ethnological collections.

The Government of the province of Cordova, in the Argentine Republic, has granted funds for establishing a network of meteorological stations over the province, and appointed Prof. Doering head of the service. The value of the undertaking is enhanced by the great diversity of position among the stations, on pampas, wooded plains, mountains, and salt lakes, and in their varied elevations ranging from 240 to 9,425 feet above the sea.

An international commission is at work surveying the boundary between Brazil and the Argentine Republic; and the question of boundary between the Argentine Republic and Paraguay threatens to come up if it should prove that the Araguay-Guazú is the main lower stream of the Pilcomayo, for the line is defined to be the Great Obaco to the Pilcomayo; and in that case the Argentine Republic would lay claim to the territory between the Pilcomayo and the Araguay-Guazú. According to older Spanish geographers, the latter stream is the largest arm of the lower Pilcomayo, but recent attempts to establish the fact have not been fully carried out.

By an ordinance of March 12, 1887, two new provinces were formed in Chili, Malleco and Cautin, thus bringing what remains of Araucania into administrative relations with the rest of the country. The chief town of Malleco is Angol; it is divided into three departments, Angol, Collipilli, and Traiguén, named by their principal towns. The chief town of Cautin is Temuco, and it is divided into two departments, Temuco and Imperial. These towns have 3,000 to 4,000 inhabitants and will soon be reached by railway.

According to the report of Captain Serrano, who was sent out by the Chilean Government, the Palena is a much larger stream than it has been supposed and represented on the maps, having a breadth in its lower reaches of 800 metres, and being navigable for a long distance. Many new species of plants and a few of insects were found by the expedition. It also confirmed the report that the high chain of the Andes is not here the water-shed between the Atlantic and Pacific; but that this is formed by a table-land about 500 metres in height lying east of the Andes. The streams upon it rise in small lakes and pass through narrow defiles in the Cordilleras, and thus reach the Pacific. The land on the eastern slope of the mountains west of this water-shed is well adapted for grazing. This makes necessary a new settlement of the boundary between Chili and the Argentine Republic, which, according to the treaty of 1881, is to follow the water-shed, and, in case of any difficulties arising from this line being indistinct or not understood, to be settled by a commission appointed by the governments of the two countries.

Lieut. C. Moyano reports to the Argentine authorities the results of a recent journey to

the sources of the streams south of the Santa Cruz. He finds that the waters of the Pacific penetrate forty-five nautical miles eastward of the Cordilleras and form harbors in East Patagonia, and that the Argentine lake is connected with the lake lying south of it. This agrees with the observation of Moreno and Moyano in 1877, but was disputed by Rogers and Ibar after their journey in 1880. Lieut. Moyano finds reason to believe that all the Patagonian lakes are connected. As to the fitness of the country for colonization, he says: "The coast region has scanty but peculiar vegetation, which can be utilized for the feeding of cattle, sheep, horses, and goats. A few tracts in the lowlands and river-valleys are adapted for farming. The central region is less suitable for these purposes; for, besides the poverty of vegetation, it seems to be impossible to maintain cattle there during the winter, which is uncommonly severe, owing to the height of the table-lands and the distance from the sea. The mountain region, beginning at the first spurs of the Cordilleras, is marked by vast, dense forests of antarctic beeches, and is rich in plants adapted for grazing. I think it well suited for that purpose; the presence of thousands of wild horses indicates that the protection of the forests offsets the cold produced by the elevation. As to the prospects for mining, though I have found traces of coal and iron at many points, yet they were so far from the highways as not to be of any value at present. I have not found other minerals, but I believe the mountain region is rich in many that a specialist could discover." The lieutenant named three mountains, "Monte Andrade," 5,808 feet high, after the poet of that name; "Monte Guido," 4,200 feet, after the poet and scholar; and "Monte Guericco," 4,495 feet, for Colonel Martin Guericco, to whom many young marine officers are greatly indebted for instruction.

Lieut. del Castillo undertook an expedition to examine the harbors mentioned by Moyano. He says that with comparatively little expense the Gallegos can be connected with the harbors of the Pacific; that the pampas of the Gallegos are habitable in winter, and in every respect adapted to the raising of cattle; and that there are coal-beds of immense value in that region.

More favorable views of the fitness of Terra del Fuego, also, for cultivation are expressed by recent travelers—among them Ramon Lista and Julius Popper—and that it is particularly suitable for a grazing country. The discovery of gold on the shore of the Strait of Magellan has awakened a sudden interest in the island. M. Lista says that the mountain-chain in the Argentine part of the island should bear the name of its discoverer, Bartolomé Nodal. The Indians encountered were timid, but not unfriendly when reassured. Some of them were painted, or had their hands and arms colored white with clay, and all had their hair cut and

greased with a reddish ointment. They wore cloaks of silver-fox fur. They would not allow themselves to be measured, but were induced to dance at the sound of the trumpet. They keep great numbers of dogs, which they use in hunting. The foxes are greatly prized on account of their fur. The island is infested with great numbers of rodents, and the woods and shores are visited by vast flocks of the wild goose, plover, duck, snipe, ibis, and parrot. Seals and penguins frequent the coast.

Polar Regions.—Dr. Alexander Bunge and Baron E. von Toll report a close examination of the New Siberian Islands begun in April, 1886. The island of Liakov was found to be rich in bone fossils. On the island of New Siberia, Baron von Toll made a special examination of the mountain known to travelers as the "wood-mountain," which was found to be a beautiful tertiary profile, with carbonized tree-trunks and a rich collection of leaf impressions and fruits like the tertiary flora of Greenland and Spitzbergen, as described by Oswald Heer. Besides the fossil remains of the mammoth, rhinoceros, and musk-ox, Dr. Bunge discovered in Liakov remains of two species of oxen, deer, horses, and some smaller animals.

Lients. Ryder and Block have closed for the present their survey of the western coast of Greenland for the Danish Government, having carried it as far as from 72° to $74\frac{1}{2}^{\circ}$ north latitude. The winter of 1886-'87 was uncommonly severe, and occasioned destitution among the Greenlanders. Sickness among the dogs and scarcity of food for them prevented much use of sledges. In April an exploration was made of the ice-floids and glaciers of Augpadlartok, one of the chief parts of the undertaking. Not until the end of June had the ice so far opened that a boat-voyage could be taken northward, and even then it was with difficulty that a point fifteen miles north of the last town of the Danish district could be reached. Seen from a mountain height, the sea presented an unbroken surface of ice, and the summer was so far advanced that a breaking-up of the ice could not be expected in time for anything more to be accomplished, as the travelers were due at Upernavik for the return to Europe. Besides making the coast survey and a close examination of the great ice-floids and inland lakes, they have made astronomical and physical observations, and gathered anthropologic and natural science collections.

Expeditions were undertaken this summer by Mr. McArthur, a former official of the Hudson Bay Company, who proposed to go north by land to King William Land, winter there, and resume his explorations in the spring so far as the west coast of Grinnell Land, and by Col. Gilder, of New York, whose plan was to go northward by sledge, with Esquimaux attendants from Wager River. He expects to reach Fury and Hecla Straits in the spring, and Lancaster Sound by autumn.

An expedition to the antarctic regions has

been planned by the Australian colonies, and it is understood that the English Government will contribute £5,000 on condition that an equal amount is raised in Australia.

Atlantic Ocean.—Prince Albert of Monaco took with him this summer Prof. Pouchet and Prof. Guerne, the zoölogist, in his yacht "Hirondelle" for an excursion in the northern Atlantic. They spent three weeks in the Azores, where Prof. Guerne studied the fauna in the lakes of the extinct crater.

The falling-off of the whale-fisheries in antarctic waters threatens the very existence of the people of the solitary island Tristan d'Acunha, who are descendants of the garrison kept there while Napoleon was a prisoner in St. Helena, with a few shipwrecked men that have made their home there since. Their chief means of support—the supplying of whalers with fresh meat and potatoes—is falling off; and, moreover, the island is infested with rats from a wrecked ship, that make the raising of grain impossible, and greatly injure the potato-crop. Relief was sent to them in August, 1886, and it is now proposed to remove the entire population to St. Helena or Cape Colony, though it is to be feared that they will become homesick, like the people removed thirty years ago from Pitcairn to Norfolk Island, and take the first opportunity to return. In August, 1886, the island had 97 inhabitants, of whom only 28 were men.

Observations made by M. J. Thoulet in the Gulf Stream tend toward the conclusion of Mr. Findlay that, after the stream reaches the vicinity of Newfoundland, its volume and depth are no longer great enough to exert any considerable influence on climate, and therefore the causes of the mild climate of Western Europe must be sought elsewhere.

Miscellaneous.—Major-General von Tillo gives the lengths of the longest eight rivers of the world as follows:

	Miles.
1. Missouri-Mississippi	4,194
2. Nile	4,020
3. Yang-tse-Kiang	3,155
4. Amazon	3,068
5. Yenisei-Selenga	2,950
6. Amur	2,920
7. Congo	2,888
8. Mackenzie	2,868

At the Brussels International Exhibition next year, a department will be devoted to geography and kindred sciences. It is desired that contributions be sent in of maps and atlases of all kinds, globes and spheres, statistical works and diagrams, general treatises, instruments, and articles for explorers.

Geography in Education.—Prof. Anton Stauber, of the Real Gymnasium of Augsburg, has taken the prize of 25,000 francs offered by the King of the Belgians for the best essay on the means of popularizing geography and improving its position in education of all degrees.

A committee met in England near the beginning of the year to consider the propriety of attempting to have geography placed among

the subjects of study in the national universities. In consequence of their efforts it was decided to establish a readership of geography for five years at Oxford, and Mr. H. J. Mackinder, M. A., was appointed. Mr. Mackinder arranged eleven courses, comprising eighty-eight lectures, to be given under the extension scheme from October, 1887, to April, 1888, before about 2,700 students. It is expected that, in view of the growing interest taken in the subject, a similar course will be established at Cambridge.

By a new ordinance of the German Educational Department, the subject of geography has been raised to the first rank in the higher schools of Germany; that is, it may be taken as one of a teacher's two specialties in connection with either a scientific, linguistic, or historical subject. The subjects of examination for a teacher wishing to take the *facultas docendi* in geography are laid down. There are three grades, for lower, middle, and higher classes. For the lower the teacher must have an elementary but exact knowledge of mathematical, physical, and political geography; for the middle, not only this, but acquaintance with the history of exploration and important trade-routes. For the higher, the candidate must have in addition to the foregoing a knowledge of the important geological conditions of the earth's surface, and of the political geography of the present, the politico-historical geography of the chief civilized peoples, and the leading facts of ethnography; also, a readiness in the construction of maps.

It has been decided to found professorships of geography at the Russian Universities, and a chair was to be established at the St. Petersburg University in the autumn of 1887.

GEORGIA. State Government.—The following were the State officers during the year: Governor, John B. Gordon, Democrat; Secretary of State, Nathan O. Barnett; Treasurer, R. U. Hardeman; Comptroller-General, William A. Wright; Attorney-General, Clifford Anderson; Commissioner of Agriculture, J. T. Henderson; Railroad Commissioners, Alexander S. Irwin, C. Wallace, L. N. Trammell; Chief-Justice of Supreme Court, L. E. Bleckley; Associate-Justices, M. H. Blanford and Samuel Hall, succeeded by T. J. Simmons.

Legislative Session.—The session of this year was an adjournment of the November-December session of 1886. It continued from July 6 to October 20, a period of 107 days, which, with the 50 days consumed by the first session, makes the longest legislative record in the history of the State. Fully nine tenths of the legislation was local or special. The principal acts of the first meeting were those fixing the tax-rate and making the regular biennial appropriation. For 1887 the levy is as follows: For general purposes, 2.6 mills; for completing the State capital, .85 of a mill; for the sinking fund, .82 of a mill; total, 8.77 mills. For 1888 the State capital tax is .2 of a mill less. A

poll-tax of one dollar per capita is devoted to educational purposes, while a long list of specific taxes upon the professions, traveling agents, peddlers, corporations, and other business enterprises, go into the general fund of the State. Among the specific appropriations are the following: For interest on the public debt, 1887, \$509,948; for 1888, \$507,575; for work upon the capitol building in 1887, \$258,734; in 1888, \$300,000—the last two sums forming a part of \$1,000,000 to be expended upon the structure; for the Academy of the Blind, \$19,000; for the Deaf and Dumb Asylum, \$15,000; for the Lunatic Asylum, \$175,000; for the State universities, \$8,000 each—the last three amounts being payable annually.

Other acts passed at this session were as follow:

Authorizing the probate of foreign wills, if the testator was at the time competent to make a will under the laws of Georgia.

Defining the powers of commissioners of pilotage for the ports of the State. (This is a general pilotage law, giving the commissioners power to grant, suspend, or revoke licenses to pilots; to make rules governing those engaged in pilotage; to regulate the fees to be charged; to inflict penalties; and in other ways to supervise the business. All vessels to whom a licensed pilot offers his services are compelled to pay a pilotage fee whether the offer be accepted or not.)

Authorizing the city of Macon to issue \$20,000 of bonds and to apply the proceeds of their sale in the construction of a public market-house.

Authorizing the city of Atlanta to issue new bonds at 4½ per cent. or at a lesser rate, to retire certain maturing 6-per-cent. bonds.

At the midsummer session the most notable action was that upon the Glenn bill, so called, prohibiting coeducation of the races. The provisions of this bill, which applied to every public and private educational institution in the State, made it a penal offense for any teacher of a school for colored children to admit white pupils, or for any teacher of white pupils to admit colored children, the penalty being a fine of \$1,000, or imprisonment not over six months, or work in the chain-gang not over twelve months. The measure was reported favorably to the lower house by its committee on education, and passed that body almost unanimously, only two votes (those of the only colored members of the body) being recorded against it. The bill was apparently directed against a few white teachers at the Atlanta State University for colored students, who had instructed their own children among the regular pupils of the institution. The Senate yielded in a measure to numerous protests, and amended the bill by restricting its application to schools receiving aid from the State, and by making the only penalty a prohibition of the teacher from receiving any public funds of the State, and of the pupils from ever becoming teachers in the public schools. These amendments the House refused to accept, no compromise was reached, and the bill was dropped. A subject of fruitful discussion at this session was the State road, otherwise known as the Western and Atlantic

Railroad, a lease of which from the State will expire in 1889. Resolutions advising its sale at the end of the lease were rejected, as also those recommending a new lease upon lower terms. The only action taken declares that the State shall not be liable for any betterments made by the lessees, provides for a commission to appraise the road, to ascertain its present condition, to keep it constantly under inspection during the remainder of the lease, and to report promptly to the Governor any attempt of the lessees to depreciate its value, in which case the Governor is authorized to take immediate possession in behalf of the State, and to assume the management of its operations. A bill increasing the number of Supreme Court judges from three to five was among the most meritorious acts of the session. Another bill regulates the business of insurance in the State, making the Comptroller-General an Insurance Commissioner, and requiring companies to secure a license from him before soliciting business. Other acts of this session were as follow:

Providing for the levy and sale of personalty when the title is retained in the vendor.

Authorizing the sale of the Governor's mansion and penitentiary lots in Milledgeville.

Empowering grand jurors to levy a special tax for school purposes.

A bill to prevent the running of excursion trains, steamboats, and sailing-vessels on Sunday.

To rescind and revoke the license of any foreign corporation in this State which shall remove any case from the courts of this State to the United States courts, except to the Supreme Court of the United States.

Amending the practice in equity as to granting injunctions.

Regulating the catching of oysters.

Regulating the inspections and sale of naval stores.

Giving the Methodist Historical Society access to the State records at all times, and directing the Governor to send the secretary of the society copies of the journals of the General Assembly.

Providing payment for maimed Confederate soldiers, so as to conform to the amendments to the Constitution adopted at the last election. The bill includes those who were disabled, though their limbs were not amputated. It makes an annual payment of \$80 for an arm or leg above the elbow or knee, and \$20 for an arm or leg below elbow or knee.

Codifying and revising all the present common-school laws, and perfecting the machinery of the common-school system.

Authorizing the payment of the six months' interest on the Atlantic and Gulf railroad bonds.

Education.—In 1886 there were enrolled in the public schools 319,724 pupils, 196,852 being white, and 122,872 colored. The per cent. of white youth of school-age enrolled was 74.18, the per cent. of colored youth being 50.52. Of the total number of youths of school-age, white and colored, 62.84 per cent. are enrolled in these schools. The institutions of higher education supported by the State are reported to be doing good work. An extra appropriation, aggregating \$17,000, was made by the Legislature of this year for repairs upon the State University buildings at Athens, and at the branch colleges at Dahlonega, Milledgeville, and Thomasville.

Convicts.—Attempts were made this year to improve the condition of the convict camps, and to abolish in part the camp system, but the Legislature took no action except to pass a bill rewarding good behavior by diminishing the length of sentence. It provides that for continuous good conduct on the part of the convict two months shall be deducted from his sentence the second year, and three months each succeeding year to ten, inclusive; after ten, four months each year. An investigation was had by the Governor during the summer into the conduct of the lessees at several of the camps, against whom charges of excessive punishment of convicts and of requiring excessive labor were preferred. The Governor found these charges sustained with respect to penitentiary companies numbered two and three, and imposed a fine of \$2,500 upon each.

Railroads and Water-ways.—During the year, eight different lines of railroad were in process of construction, and 281 miles were completed. This is a considerable increase over previous years. The Legislature granted incorporation to more than forty new companies, some of which were prepared to begin construction before the end of the year. The city of Atlanta will reap a large share of the benefit from this new impulse in railroad building, three different lines being already nearly completed to that place, and a fourth and most important one, connecting it with Knoxville, Tenn., and thence with all points in the West, being sure of early construction. At the same time improvements have been made on many of the rivers of the State under the direction of the General Government. On the Ocmulgee a good navigable channel has been obtained between Hawkinsville and the junction of the Oconee. The Oconee is being dredged to secure a uniform depth of three feet at low water as far up as Milledgeville. The work is more than half completed. Nearly \$100,000 has been expended on Flint river, resulting in a completed high-water channel from the mouth of the river up to Albany, a completed low-water channel of the projected depth from the mouth to Tea-Cup shoal, and a partially completed high-water channel over the river between Albany and Montezuma. The expenditure on the Chattahoochee has been \$188,857, and it has resulted in securing a fair navigable channel between Chattahoochee and Eufaula at all seasons, and between Eufaula and Columbus at all times except during the prevalence of extreme low water. Improvements on Coosa river have cost \$417,896, and have opened a good channel from Rome to Greensport. To develop the Coosa coal-fields in the vicinity of Broken Arrow, is the primary object of this work. The Tallapoosa, Oostanula, and Coosawattee rivers have also been improved.

Prohibition.—As the local-option law permits an election upon this question in any county once in two years, on petition of a sufficient number of voters, contests similar to those of 1885 took place in the autumn of this year in

nearly all the large counties. Strenuous efforts were made by the friends of license to recover the ground swept from them by the tide of prohibition sentiment at the previous election, but outside of Atlanta they were attended with only slight success. In that city, after a spirited contest, in which the young men bore a conspicuous part on each side, the Prohibitionists were defeated by 1,122 votes out of a total vote of 9,244. The majority against license in 1885 was 225 out of a total of about 7,000 votes. Of the enforcement and effect of prohibition in the city during the year a local paper says:

In consideration of the small majority with which prohibition was carried, and the large number of people who were opposed to seeing it prohibit, the law has been marvelously well observed. Prohibition has not injured the city financially. According to the assessors' books, property in the city has increased over \$2,000,000. Taxes have not been increased. Two streets in the city, Decatur and Peters, were known as liquor streets. Property on them has advanced from 10 to 25 per cent. The loss of \$40,000 revenue, consequent on closing the saloons, has tended in no degree to impede the city's progress in any direction. Large appropriations have been made to the water-works, the public schools, the Piedmont fair, and other improvements. The business men have raised \$400,000 to build the Atlanta and Hawkinsville Railroad. The number of city banks is to be increased to five. The coming of four new railroads has been settled during the year.

Farmers' Convention.—There was held at Atlanta in August an important and interesting interstate convention of farmers, at which all the Southern States were represented, and at which the causes and remedies of the existing agricultural depression in that region were discussed at length. Between 200 and 300 delegates were in attendance. The following are some of the resolutions adopted:

Whereas, The cotton States of the South need capital to develop their resources, and the farmers the facilities for borrowing money at a low rate of interest; therefore, be it

Resolved, That in the opinion of this convention it is expedient that the National banking act be so amended as, first, to repeal the tax now existing on the issue of State bank circulation; second, by repealing the clause of said act that prohibits national banks from accepting land as security for the loan of money.

Resolved, That our Senators and Representatives in Washington be requested to use all efforts in their power to advance the Department of Agriculture to the dignity of a Cabinet position.

Whereas, It appears, and really is a fact, that great depression exists throughout the whole cotton-growing region; and, whereas, we believe it to be the duty of this convention to ascertain the cause and to find a remedy; therefore, be it

Resolved, 1. That we believe the cause to be twofold, to-wit: first, undue taxation; second, the raising of too much cotton, thereby neglecting to produce home supplies.

Resolved, 2. That we believe the remedy for the first is the united efforts of our public servants in the Legislatures and in Congress, and this convention earnestly request both these bodies to grant us relief.

Among the many evils under which the agriculture of the South is laboring, and among the serious obstacles to its progress, is the crop-lien and chattel-mortgage system, now being a part of the business methods

of large portions of the States here represented; therefore, be it

Resolved, That this convention urges upon the farmers throughout the South the pressing importance of bringing to bear upon the Legislature of their respective States all legitimate influences which may tend to give speedy relief to our farmers and final abolition to this pernicious and ruinous system.

We desire that Congress shall pass a law returning through the States, to those entitled to the same, the money unjustly collected on what is known as the cotton tax.

Whereas, Certain corporations and individuals have from time to time combined and conspired to destroy or to depreciate the value of some of the agricultural products of the cotton States by such speculation or gambling as that usually termed "dealing in futures," with the prospective cotton-crop as a basis, and by the operations of the American Oil Trust Company in their well-nigh successful effort to crush out all competition either in the purchase of seed, or the sale of the products thereof; therefore

Resolved, That the influence of the entire agricultural population of all the States here convened be brought to bear upon the legislative powers of our respective States to secure the enactment of such laws as will properly define these crimes and furnish commensurate penalties therefor.

The cotton-crop of Georgia for 1887 was estimated at 890,900 bales, raised upon 2,950,000 acres. A severe cold and frost, which visited the State early in March, did great injury to growing fruits, wholly destroying the crop in some sections.

GERMANY, an empire in central Europe, founded on treaties concluded between the North German Confederation and the Grand Duchies of Baden and Hesse on Nov. 15, 1870, the kingdom of Bavaria on Nov. 28, 1870, and the kingdom of Wurtemberg on Nov. 25, 1870. The ratifications of the treaties were exchanged on Jan. 29, 1871, at Berlin. For these treaties was substituted, by the decree of April 16, 1871, the Constitution of the German Empire, which went into force on May 4, 1871. The headship of the empire belongs to the Prussian crown. The hereditary dignity of German Emperor was accepted by King William I of Prussia at Versailles on Jan. 18, 1871, in a proclamation addressed to the German people. The confederation of states forming the empire is invested with sovereign imperial power, exercised by the crown of Prussia and by the Federal Council, composed of representatives of the confederated states. The imperial power, in the exercise of certain functions, requires the consent of the Reichstag or parliament, composed of representatives freely elected by the German people. This assembly exercises also in certain regards a right of control.

The Emperor William was born March 22, 1797. The heir-apparent is Prince Frederick William, born Oct. 18, 1881. The next in succession is his son, Frederick William (called Prince William), born Jan. 27, 1859, whose eldest son, named also Frederick William, was born May 6, 1882. (See illustration, page 321.)

The Chancellor of the Empire is Prince Otto von Bismarck, who is also President of the Council of Ministers of State. Minister of Foreign Affairs, and Minister of Commerce in the

Prussian Government. The ministers, who are under the direction of the Chancellor, are as follow: Secretary of State in the Office of Foreign Affairs, Count Herbert von Bismarck-Schönhausen; Secretary of State in the Imperial Office of the Interior, Herr von Böttcher; Chief of the Imperial Admiralty, Lieut.-Gen. von Caprivi; Secretary of State in the Imperial Ministry of Justice, Dr. von Schelling; Secretary of State in the Treasury of the Empire, Dr. Jacobi; President of the Imperial Office for Railroads, Herr Maybach; President of the Court of Audit, Herr von Stuenzner; President of the Administration of the Invalid Funds, Dr. Michaelis; Chief of the Imperial Post-Office, Dr. von Stephan.

Area and Population.—The area of the several states of the empire in square kilometres and their population as shown by the final results of the census of Dec. 1, 1885, are as follow:

STATES.	Area.	Males.	Females.	Total population.
Prussia.....	843,847.24	18,898,604	14,424,866	23,313,470
Bavaria.....	75,859.71	2,639,242	2,180,957	4,820,199
Saxony.....	14,992.94	1,542,406	1,689,595	3,232,000
Württemberg.....	19,508.69	960,510	1,084,875	1,993,135
Baden.....	15,081.18	782,082	819,216	1,601,255
Hesse.....	7,681.88	473,740	492,871	956,611
Mecklenburg- Schwerin.....	18,309.77	284,241	290,911	575,152
Saxe-Weimar.....	8,594.86	151,996	161,950	313,946
Mecklenburg- Strelitz.....	2,929.50	43,103	50,263	93,371
Oldenburg.....	6,422.52	169,043	173,477	342,520
Brunswick.....	8,690.43	186,175	196,277	382,452
Saxe-Meiningen.....	2,468.45	105,061	109,823	214,884
Saxe-Altenburg.....	1,828.75	73,572	82,833	156,405
Saxe-Coburg- Gotha.....	1,956.50	95,581	108,293	203,874
Anhalt.....	2,847.85	122,076	123,490	245,566
Schwarzburg- Rudolstadt.....	940.42	40,738	43,108	83,846
Schwarzburg- Sondershausen.....	862.11	35,906	37,703	73,609
Waldeck.....	1,121.05	26,901	29,674	56,575
Reuss (elder line).....	816.89	27,307	28,597	55,904
Reuss (cadet line).....	825.67	53,947	56,631	110,578
Schaumburg- Lippe.....	883.71	18,563	19,641	38,204
Lippe.....	1,215.20	67,776	62,436	130,212
Lübeck.....	297.70	82,692	84,966	167,658
Bremen.....	255.56	79,469	86,159	165,628
Hamburg.....	409.73	252,553	265,787	518,340
Alsace-Lorraine.....	14,509.42	771,269	798,086	1,569,355
German Empire.....	540,596.63	22,938,664	23,922,040	46,860,704

The natural movement of population in the principal states was in 1885 as follows:

STATES.	Marriages.	Births.	Deaths.	Increment.
Prussia.....	230,707	1,108,760	761,184	347,626
Bavaria.....	86,496	206,644	160,164	46,480
Saxony.....	29,286	137,985	95,851	42,084
Württemberg.....	18,264	74,582	55,798	18,784
Baden.....	10,646	54,107	40,029	14,138
Alsace-Lorraine.....	10,400	50,281	41,095	9,186
Hesse.....	6,960	31,220	22,898	8,322
Other states.....	30,860	135,149	91,458	43,665
German Empire.....	363,619	1,798,687	1,265,452	533,185

The population of the principal cities on Dec. 1, 1885, was as follows: Berlin, 1,815,287; Hamburg, 305,690; Breslau, 299,640; Munich, 261,981; Dresden, 246,086; Leipzig, 170,840; Cologne, 161,401; Frankfort-on-the-

Main, 154,518; Königsberg, 151,151; Magdeburg, including Neustadt, 148,471; Hanover, 139,731; Stuttgart, 125,901; Bremen, 118,895; Düsseldorf, 115,190; Nuremberg, 114,801; Dantzig, 114,805; Strasburg, 111,987; Chemnitz, 110,817; Elberfeld, 106,499; Altona, 104,717; Barmen, 103,068.

The number of foreigners naturalized in 1885 was 4,893; the number of Germans who renounced their rights of nationality, 18,877, of whom 18,965 were emigrants to the United States. The total emigration in 1886 was 76,687, as compared with 103,642 in 1885 and 143,586 in 1884. The emigration to the United States in 1886 was 72,403, as compared with 98,628 in 1885, 139,839 in 1884, 159,894 in 1883, 189,373 in 1882, 206,189 in 1881, 103,115 in 1880, 30,808 in 1879, and 20,373 in 1878. The total emigration from Germany since 1820 is reckoned at 4,700,000 persons, of whom 3,600,000 settled in the United States.

Commerce.—The Custom-House returns for 1885 and 1886 give the values of the imports and exports of the German Zollverein, in millions of marks and tenths of millions, as follow:

ARTICLES.	IMPORTATION.		EXPORTATION.	
	1885.	1886.	1885.	1886.

Navigation.—The movement of shipping in German ports for the year 1885 was as follows:

FLAG.	Total vessels.	Registered tons.	With cargo.	Registered tons.	Steamers.	Registered tons.
Entered:						
German.	45,506	5,189,701	37,046	4,650,915	13,750	3,641,570
Foreign.	15,318	3,024,882	12,707	4,593,569	7,877	4,124,545
Total..	60,719	10,190,088	49,753	9,244,504	21,627	7,776,115
Cleared:						
German.	45,491	5,174,592	36,916	4,206,478	13,759	3,645,144
Foreign.	15,318	5,063,069	10,238	8,804,662	7,881	4,181,895
Total..	60,809	10,238,611	47,154	7,512,140	21,640	7,776,089

The merchant marine on Jan. 1, 1886, comprised 4,135 vessels, as compared with 4,257 in 1885 and 4,315 in 1884. The aggregate tonnage was 1,282,449, as compared with 1,294,288 in 1885 and 1,269,477 in 1884. The crews numbered 38,981 men. The steam-vessels were 664 in number, as compared with 650 in 1885 and 608 in 1884. Their tonnage was 420,605, having increased from 413,948 in 1885 and 374,699 in 1884. Of the total fleet, 2,525 vessels belonged to North Sea ports, with an aggregate burden of 861,083 tons; and of the steamers, 387, of 297,808 tons. The vessels of the Baltic ports numbered 1,610, of 421,366 tons, of which 327, of 122,797 tons, were steamers.

Railroads.—The state lines of railroad in operation in April, 1887, had a total length of 33,782 kilometres. The lines belonging to companies had a length of 4,644 kilometres, besides 290 kilometres managed by the Government. The railroads of Germany, Austria, the Netherlands, Luxemburg, Russian Poland, the joint-stock railroads of Roumania, and some of those of Belgium, are under the control of the Union of German Railroads, which has its office in Berlin, and regulates the traffic and arrangements on the 38,146 kilometres of German lines, 28,201 kilometres of Austrian lines, 2,676 kilometres in Holland, and 2,499 kilometres in other countries, making in all 66,522 kilometres.

Posts and Telegraphs.—The telegraph-lines of the empire had in 1886 a total length of 86,

199 kilometres, inclusive of the 8,551 kilometres of Bavarian and 2,958 kilometres of Württemberg lines. The total length of wires was 306,038 kilometres. There were 20,510,294 dispatches sent in 1886, of which 18,598,456 were paid, and 974,890 official internal messages, and 2,433,678 departing, 2,788,237 incoming, and 725 transit international messages.

The postal traffic of the Imperial, Bavarian, and Württemberg post-offices in 1886 was as follows: Letters, 858,587,550; postal-cards, 261,056,660; letters under bands, 245,618,370; circulars, 20,187,170; newspapers, 539,615,480; money-orders, 64,817,455; packages, 98,654,840, of the aggregate weight of 404,255,460 kilogrammes.

PRINCE WILLIAM AND HIS SON.

Bavaria and Württemberg retain the administration of their telegraphs and postal service. The receipts of the Imperial, Bavarian, and Württemberg postal and telegraph administrations in the fiscal year 1886-'87 were 202,846,932 marks, and the expenses 175,076,000.

Finances.—The budget of the empire, as approved on March 30, 1887, places the revenue for 1887-'88 at the following amounts in German marks:

SOURCES OF REVENUE	Receipts.
Customs	345,666,000
Tobacco-tax	8,191,000
Beet-sugar tax	85,420,000
Salt-tax	88,555,000
Spirit-tax	88,188,000
Beer-tax	17,846,000
Customs and excise duties of states not in the Zollverein	8,908,000
Playing-cards	1,040,000
Bill-stamps	6,410,000
Other stamps	19,684,000
Registration	582,000
Posts and telegraphs	99,447,658
Imperial printing-office	1,078,180
Net railroad receipts	16,696,600
Imperial bank	2,108,500
Various administrations	8,129,228
Invalid funds	26,846,068
Construction funds	1,200,000
Extraordinary receipts	72,597,191
Matricular quotas	167,044,406
Total receipts	745,907,486

The total expenditure decided on for the year ending March 31, 1888, was 745,207,436 marks. An annex to the law fixed the expenditure on the Imperial Bank at 188,000 marks, and on June 1, 1887, a supplementary credit of 176,085,950 marks was granted, of which 19,408,019 marks were for permanent and 156,677,981 for non-recurring expenditures, the latter to be covered by a loan. Of this 80,225,077 marks is devoted to the army administration, 29,500,000 marks to strengthening fortresses, and 86,314,000 marks to railroads for military purposes.

The debt of the empire, of the nominal amount of 450,000,000 marks, was raised on 4-per-cent. bonds at various times. Issues of 8½-per-cent. bonds have been authorized, and 5,078,500 marks had been emitted on March 31, 1887, while 816,264,473 marks were still to be realized. An imperial decree was issued on June 24, 1887, for the issue of a loan of 238,004,970 marks, the proceeds of which were to be employed in covering the expenses connected with the incorporation of Hamburg and Bremen in the Custom's Union, the construction of the North Sea Canal, the army and navy administration, and the completion of the railroad network in the interests of the national defense. When 100,000,000 marks of these bonds were put on the market on July 5, 1887, they were subscribed for more than seven times over. The currency notes in circulation on April 1, 1887, amounted to 133,868,475 marks.

The invalid fund on March 1, 1887, amounted to 492,719,529 marks, besides 3,671,397 Frankfurt florins in securities, and 7,491,884 marks in silver. The fortress construction fund was 20,479,691 marks; the Reichstag-building fund, 19,743,721 marks; the war fund, 120,000,000.

The budget for the Kingdom of Prussia, as adopted for the year ending March 31, 1888, makes the total gross receipts 1,316,717,307 marks, and the net revenue 684,543,761 marks. The ordinary expenditures, including 632,173,546 marks for financial administration, are calculated at 1,283,120,623 marks, and the total disbursements, including extraordinary and

temporary expenditures, are made to balance the estimated revenue. The Saxon budget for 1887 makes the ordinary expenditures 74,865,542 marks, and the extraordinary 27,603,690, which sums balance the estimated revenues. The debt of Saxony in January, 1887, was 644,061,400 marks. The budget of Bavaria for each year of the biennial period of 1886-'87 estimates the receipts at 241,491,646 marks, and the expenditures at the same figure. The public debt of Bavaria was 1,354,681,668 marks on April 1, 1887. The budget of Württemberg for the year ending March 31, 1887, makes the receipts 56,238,427 marks, and the expenditures the same. The debt on April 1, 1887, was 424,051,519 marks, of which all but 44,717,897 marks was contracted for the construction of railroads. The budget of Alsace-Lorraine for 1887-'88 makes the ordinary gross receipts 40,181,981 marks, and the total expenditures 39,090,195 marks, including 1,662,088 marks for extraordinary purposes. There is, besides, an extraordinary budget of 984,301 marks of receipts, and 2,026,000 marks of expenditure.

The Army.—The peace effective of the German army, under the new army law of 1887, is 19,262 officers, and 468,409 rank and file, with 1,500 guns and 84,077 horses. The general staff numbers 1,972 officers, with 65 soldiers employed; there are 518 battalions of infantry of the line, numbering 10,861 officers and 312,495 men; 21 battalions of Jägers, 446 officers and 11,816 men; Landwehr cadres for 277 battalions, 316 officers and 4,862 men; total infantry, 811 battalions, 11,128 officers, and 329,173 men. There are 465 squadrons of cavalry, numbering 2,358 officers and 64,590 men, with 62,469 horses. The field artillery, consisting of 265 batteries, with 1,500 guns, counts 1,989 officers and 38,098 men, with 18,232 horses. The fortress artillery is divided into 31 battalions, and numbers 730 officers and 17,226 men. Of pioneers there are 24 battalions, having 558 officers and 12,285 men; train, 18 battalions, numbering 256 officers and 6,111 men, with 3,360 horses; special corps, 326 officers and 861 men. The rank and file of the army is divided into 55,447 non-commissioned officers, 19,270 musicians, 378,290 soldiers, 3,704 hospital-attendants, 10,850 workmen, and 848 assistant-paymasters. Not included in these figures are 1,777 surgeons, 641 veterinarians, 840 paymasters, 803 armorers, and 93 saddlers. The horses, as enumerated, do not include the officers' mounts and the work-horses. The Bavarian, Royal Saxon, and Württemberg armies are independently organized and under the command of the rulers of those states, while all other parts of the empire are under the Prussian military jurisdiction. The Prussian army consisted of 14,937 officers and 862,468 men, with 66,010 horses; the Bavarian army, 2,257 officers and 54,185 men, with 9,004 horses; the Royal Saxon army, 1,261

officers and 31,810 men, with 5,869 horses; the army of the King of Württemberg, 807 officers and 19,946 men, with 8,694 horses.

The increase in the peace effective of the German army under the septennate law of 1887 is 41,135 men. Of these, 33,298 go to increase the infantry. Of the 31 new battalions are created four new Prussian regiments and one Saxon, while fourth battalions are added to 15 Prussian regiments, and a new battalion of Saxon Jägers is formed. The effective of each Prussian battalion is raised from 569, including 18 officers, to 592. Of the 335,328 troops in active service, 42,967 are stationed in Alsace-Lorraine. The system of reserve which has been adopted enables Germany to fill the cadres of 166 fourth battalions on the day following mobilization, and thus have 700 battalions available for service. The artillery batteries are increased from 840 to 864, while arrangements are introduced for the formation of 91 more in case of mobilization.

The German army is divided into 18 army corps, viz., 11 Prussian, besides the Guard, which forms a distinct corps; the Saxon, Baden, and Württemberg corps, which are numbered 12, 13, and 14; the new Alsace-Lorraine corps, which is called the 15th; and 2 Bavarian corps, which have no numbers. A Hessian division is attached to the 11th corps. During the past five years the peace effective of the German army has been increased 65 battalions and 385 guns.

The fortifications on the French frontier, with the railroads, have been designed with reference to a rapid offensive movement. Strong works and strategic railroads have also been built on the Russian frontier, but more of a defensive nature and without the same facilities for rapid concentration. The German troops on the Russian frontier have been increased 21 battalions of infantry, 27 batteries of artillery, and 15 squadrons of cavalry. Since 1878 Germany has built in the eastern provinces 4,850 kilometres of railroads. There are 11 German railroads, by means of which troops can be forwarded to the Russian frontier, and ten junction stations where they can be thrown out of trains and concentrated. Germany has created first-class fortresses at Thorn, Posen, Dantzig, and Königsberg, and is building a similar fortress at Grandenz.

In the autumn session of the Reichstag, bills were introduced for the reorganization of the Landsturm, and the modification of the conditions of service in the Landwehr. Both the Landwehr and the Landsturm will henceforth be divided into two classes. In the first class of the Landwehr the term of service is, as now, five years; while in the second class, in which there is no drill and no periodical roll-call, with liberty to emigrate, the liability to service continues until the men have completed their thirty-ninth year. The first class of the Landsturm consists of persons who have, for some reason, not served in the army, but who remain

liable to serve until they have completed their thirty-ninth year. The second class of the Landsturm will only be called out in the last line of defense, and will be composed of men who have already served, or are still liable to service, and are between the ages of thirty-nine and forty-five.

The Navy.—The war fleet on April 1, 1887, consisted of 18 armored ships, carrying 148 guns; 14 smaller iron-clads and protected vessels, with 17 guns; 9 frigate cruisers, with 122 guns, 8 corvettes, with 94, and 5 other cruisers with 22; 5 gunboats, with 16 guns; 5 avisos, with 12 guns; 11 school-ships, with 84 guns; and 81 vessels for various purposes, having 9 guns. The aggregate tonnage is 182,102; the number of men in the crews, 16,581. The military marines, according to the budget of 1887-'88, number 15,256. The "Schwalbe," a new cruiser of 1,300 tons, was launched at Wilhelmshaven in 1887. She is intended for service on the coasts of the African colonies, and has a speed of 18½ knots. The armament consists of 4 Krupp guns of 10½ centimetres' caliber, firing fore and aft, and 4 revolving cannon of the same description.

Dissolution of the Reichstag.—On January 11 the Chancellor made his final appeal to the Reichstag in behalf of an increase of the army by 41,000 men, and a new septennial army budget. "The probability of a French attack on us," he said, "which does not exist to-day, will arise upon the accession to power of another Government than the present, if France has any reason to believe that she can overcome us. Then, I believe, war will be quite certain." If the French, he added, thought that their army was more numerous than that of Germany, their artillery more efficient, or their armament more effective, the resolution to go to war might be taken, for as soon as they believed themselves able to win, they would begin war. That was his firm and irreversible conviction, which he based upon long experience in politics. He had no fear of Germany being worsted, but they must allow for the possibility. Those who pretended that the army needed no strengthening were civilians; but generals and officers who had been in contact with French sabers were of a very different opinion. It would not do to underestimate the strength of France. "France," said Prince Bismarck, "is a great and powerful country, as powerful as we. France has a warlike people, and a brave people, and at all times has possessed skillful generals. It is an accident that the French have succumbed to us. You underestimate the French in a most mistaken way, and it would be vanity to say that France might at once be regarded as beaten if she were opposed to us." Moltke expressed his conviction that if the demands of the Government were refused war would be certain.

Dr. von Stauffenberg, a deputy of the Opposition, moved to fix the peace establishment of the army at 468,409 men, the figure de-

manded by the Government, but to vote the supplies for three years, beginning April 1, 1887, instead of for seven years. This amendment was carried by 183 votes against 154, the Social Democrats abstaining from voting. The Chancellor, as soon as the vote was announced, read a decree from the Emperor dissolving the Reichstag.

The General Elections.—The new elections were fixed for February 21, the electoral campaign. The Chancellor had made a distinct threat to carry out his military plans, whether the Parliament agreed to them or not. Not only the chief of the general staff, but the Emperor intervened in the question, and appealed to the loyalty and patriotism of the German people to return a willing majority. Official, military, and journalistic agencies were made the most of by the Government in the electoral campaign. Not content with all his ordinary electoral weapons, Prince Bismarck procured the intervention of the Pope. A dispatch was sent on January 21 by Cardinal Jacobini, the Papal Secretary of State, to the Nuncio at Munich, in response to a question addressed to the latter by Baron von Frankenstein, one of the leaders of the Clericals in the Reichstag, who asked whether the Curia considered the Center party as superfluous. Cardinal Jacobini, in the Pope's name, acknowledged the services of the Center party, and expressed the desire that it would still continue to work for the complete removal of exceptional ecclesiastical legislation, the amelioration of the condition of German Catholics, and the improvement of the Pope's position. While admitting that the members of the party have liberty of action in non-ecclesiastical matters, the Pope had the right to express his opinion on the military septennate question, because it involved considerations of moral and religious import. He expected from the conciliatory attitude of the Center on this question a beneficial effect in regard to the final revision of the May laws, and also hoped, through the intermediary of the Center, to work for the maintenance of peace. In conclusion, the Pope expressed his desire to meet the views of the Emperor and Prince Bismarck in order to render the powerful German Empire disposed to a future improvement of the position of the Papacy. There was much speculation throughout Europe on the publication of this note as to whether Prince Bismarck had actually agreed to intervene for the restoration of the temporal power of the Pope.

The National Liberals, who had declared for the septennate, and have returned to the lead of Prince Bismarck, and become identified with the policy previously supported by the two Conservative parties, formed an electoral agreement with the latter to give a united vote in each district for a candidate of the party most numerously represented. This treaty, or cartel, gave the name of "Cartel Brothers" to the members of the three parties. Herr von

Bennigsen, who through dissatisfaction with the Chancellor's domestic policy had retired from public life two years before, resumed the leadership of the National Liberals, who, with the help of the cartel, recovered a great part of their former strength, and became the most numerous party in the new Reichstag. Their members were increased from 51 to 104. Their popular vote was 1,658,158, showing an increase of 661,125. The Old Conservatives, who had 77 members in the last Parliament, gained only three seats, though their popular strength increased to 1,194,504, a gain of 333,441 ballots. The Imperialists polled 693,195 votes, an increase of 305,508, giving them 39 deputies, instead of 28 in the last Parliament. The Cartel Brothers gained votes at the expense of the Deutsche Freisinnigen, or Liberalist party, which was founded from the old Progressive party and seceders from the National Liberals, and follows the lead of Eugen Richter, deputy from Hagen. The popular vote for this fraction fell to 549,302 ballots, and the representation in the Reichstag was reduced from 67 to 31, and would have been still smaller if the Socialists had not come to the aid of the Liberalists in the supplementary elections. The Socialist deputies were again reduced to 11, although the party polled 774,128 votes, showing an increase of 224,192 since 1884. In Alsace-Lorraine the stadtholder, Prince Hohenlohe, had issued a vigorous manifesto, appealing to the people to accept definitely the treaty of 1871. In addition to the covert menaces of the proclamation, military and administrative pressure was exerted to influence the elections, but the result was that 247,654 votes were cast for Protesting candidates, being 82,088 more than in the last elections, again returning a solid phalanx of 15 Alsace-Lorrainers to the Chamber. The Volkspartei, known as the Popularist or Democratic party, was entirely extinguished, losing all of its 8 seats. The Clericals, or Center party, otherwise called the Ultramontanes, or Blacks, came back in undiminished strength, having 99 members in the new Reichstag as in the old, and polling 1,627,095 votes, a gain of 248,701; yet before the electors, in deference to the Pope's appeal, a part of them had changed their attitude toward the septennate bill, and were pledged for its support, while the bulk of the party, following Windhorst and Frankenstein, strongly resented the dictation of the Pope. The Poles in the new Parliament number 13, having lost 3 seats, though the popular vote showed a slight increase. The Independents, or Savages, with the Guelphs and Danes, were reduced in the Reichstag from 12 to 5, though they also received as many ballots as in 1884.

The Social Democratic vote in 1871 was 123,975; in 1874 it had increased to 351,592; and in 1877 to 493,288. In 1878, after the attempts of Hödel and Nobiling, and immediately before the passing of the anti-Socialist law, it was 437,158. In 1881, after the Social-

ist law had been three years in operation, it fell away to 311,961. In 1884 it increased to about 550,000, and in 1887 showed a further increase of 224,192. In Berlin the number of Socialist voters, which was only 67 in 1867, was about 68,000 in 1884, and in 1887 had grown to 98,000.

The New Reichstag.—Parliament was opened on March 8. The army bill was announced at the head of the Government programme, and in connection with it the budget would have to be promptly voted and new sources of revenue considered. The minor measures heralded in the speech from the throne were the extension of accident insurance to mariners and house-builders, the amplification of the functions of artisans' guilds, the prevention of the use of noxious colors in articles of food and drink, and the establishment of a seminary at Berlin for the teaching of Oriental languages.

The septennate bill was passed on the second reading, March 9, by 247 votes to 20, there being 83 abstentions, mainly on the part of Clericals. A motion to restrict the period to three years was negatived by 222 votes against 23. The army budget, including a provision for a school for non-commissioned officers at Neubreisach, which was several times rejected in the former Reichstag, was agreed to on March 21 by a large majority. A bill to impose a tax on brandy was introduced in May. A higher duty on imported and domestic sugar was also demanded. On May 20 the Reichstag passed the supplementary estimates, authorizing within the next few years the expenditure of 860,000,000 marks for altering and perfecting the defensive resources of the empire, providing new equipments for the troops, building barracks and fortresses, laying double tracks on the railroad lines of Alsace-Lorraine, and building new strategic lines, including a railroad to South Germany that will not pass through Switzerland. On May 28 the international treaties for the protection of works of literature and art and for the protection of submarine cables were approved. The seamen's insurance bill was agreed to. A bill relating to the administration of justice in territories under German protection settles the law regarding real estate in the new colonial possessions. The spirit tax, with some amendments, was passed finally on June 17; also a bill prohibiting the use of injurious colors in articles of nourishment, a bill relating to artificial butter, and a workmen's protection bill.

Amendment of the May Laws.—In April the Prussian Diet and Herrenhaus repealed important sections of the restrictive ecclesiastical laws. The new amendments to the May laws were first introduced on the basis of an agreement between the Prussian Government and Dr. Kopp, Bishop of Fulda, acting under direct instructions from Rome, and, after undergoing a few modifications, the bill was finally passed in such a shape as caused Monsignor Galimberti, who was in Berlin at the time as

Special Envoy of Leo XIII on the occasion of the Emperor's birthday, to telegraph the result to the Vatican as a cause of gratulation. The fate of the bill was more doubtful in the Upper Chamber. The Chancellor made an important speech in its defense, which he began by pointing out that, with regard to the readmission of religious orders, the chief point to be ascertained was whether Prussian Catholic citizens believed themselves to be in need of such orders. It was his opinion that this need should be satisfied in harmony with the legislation of the country. The state, proceeded the Chancellor, naturally had an interest in the good training of the priests, but such training could just as well be acquired at seminaries as at the universities. The bitterest enemies of the Government came from universities, not from seminaries. Referring next to the law which required the higher ecclesiastics to notify to the state appointments of subordinates, Prince Bismarck observed that he did not attach any special importance to this provision, more particularly in view of the experience gained that clergymen, who had for years exercised their functions under the very eyes of the Government, had changed their disposition as soon as they became bishops. It was unjust to charge the Government with making too large concessions to the Catholics. It had not given up any of its sovereign rights. He had never dreamed of engaging in permanent strife with the Curia. As long ago as 1875 he had called Cardinal Antonelli's attention to the danger which would arise from the formation of a Catholic political party in Prussia. From the moment when the Curia manifested a pacific disposition he had put forward a programme of peace, for the realization of which he had now worked ten years. By the proposals before the House he hoped to obtain a lasting peace. But, should that expectation not be fulfilled, the measures now proposed could at any moment be easily rescinded. It was imperative that the Center, which constantly allied itself with all elements hostile to the state and the empire, should be deprived of any pretext for opposition which the existing state of the law might afford. It was, he added, out of regard for the unity of the nation and the dangers with which that unity was threatened, that he had initiated the present Ecclesiastical Bill, and he did this with a full recognition of his responsibility. Whether the bill would lead to the establishment of religious peace could not yet be known, as the leaders of the Center party had placed themselves in opposition to the Pope. The principles of the Progressist party itself were not less dangerous than the subversive tendencies of the lower clergy, in whose removal the Pope and the Emperor had an equal interest. If the Sovereign Pontiff and the Emperor were at one, the opposition of Herr Windthorst and the Center ceased to have further significance. Prince Bismarck had threatened that if the bill were

rejected he would resign the post of Minister-President of the Prussian Cabinet.

Frontier Troubles.—Before the elections, as a part of the policy of alarm adopted by Prince Bismarck in order to secure augmented contingents and septennial supplies for the army, a system of coercion and intimidation was introduced into Alsace-Lorraine. Many persons were arrested, and newspapers were suppressed. When the elections gave an increased majority to the Protesters, repressive measures were applied with greater severity. Social and musical organizations were suppressed, and burgomasters were deposed. The Government announced the intention of taking away all the autonomous institutions that were bestowed on the provinces in 1879. On March 31, M. Antoine, the most ardent of the protesting delegates to the Reichstag, who had been again returned from Metz with a sweeping majority, was expelled from the territory of Alsace-Lorraine, and conducted across the French boundary. Troubles on the frontier, which before were frequent, chiefly on account of the proneness of German soldiers to desert and of young Alsace-Lorrainers to escape from military conscription, were now of constant occurrence. The German authorities were accused in several instances of violating French territory, but the French Government was not disposed to make a diplomatic question of the occasional misbehavior of subordinate officials. The war feeling that was fostered in Germany met with a response from the Patriotic League, but the agitation was discouraged by the French Government, which prosecuted a newspaper for publishing anti-German articles. The German police suspected the existence of secret societies in Alsace-Lorraine which not only were in correspondence with Paul Déroulède's Patriotic League, but which furnished the French War Office with information regarding the fortifications and disposition of troops on the frontier. Several arrests were made, and a warrant was issued for the apprehension, if he appeared on German soil, of M. Schnaebeler, the French police commissary of the railroad terminus at Pagny-Sur-Moselle, who was supposed to be an intermediary of the treasonable correspondence. As soon as the German detectives were in receipt of this order, they studied means to carry it out. Herr Gautsch, the police commissary at Ars, on the German side, wrote to Schnaebeler, appointing a meeting at the boundary line in relation to the replacing of frontier posts. M. Schnaebeler went to the rendezvous, but did not see his German colleague, and, having been warned, did not venture to cross the line. On receiving a second letter, he went again on April 20, and, seeing nobody, stepped a few yards on the other side. A detective disguised as a laborer came out of a ditch and engaged in conversation, and then immediately laid hold of the Frenchman, another disguised policeman coming to his aid from a vineyard. Schnaebeler shook off his captors, and ran to

the French side, stopping as soon as he had passed the boundary pillar, and pointing to it to indicate to his pursuers that he was safe; but they seized him, dragged him back, bound him, and took him to Metz. The high court at Leipsic, which had issued the order of his arrest, had an indictment against him for treason, on the ground that he was engaged in a movement in Alsace-Lorraine for the subversion of German authority. German, and also French, law sanctions the prosecution of foreigners for high treason, even though the acts have been committed abroad. The French and German Governments both ordered an inquiry into the circumstances of Schnaebeler's arrest. Two vine-dressers, who were at work near the spot, swore that he was seized when six or seven yards within the French boundary. German railroad officials, who seem to have witnessed only the latter part of the struggle, made depositions that the whole occurrence took place on German territory. The French authorities found the decoy letters in Schnaebeler's desk.

Correspondence was carried on between the German and French Governments, each presenting the testimony that it had collected regarding the circumstances of the arrest, but little was divulged to the public, and intense excitement prevailed in France, where the secrecy and delay were interpreted either as a sign of war or a trick of speculating politicians to make money out of a financial panic. In view of the contradictory evidence, the German Government directed a fresh inquiry, which was completed on April 27. On the following day Prince Bismarck addressed a note to the French ambassador, M. Herbette, affirming that the arrest in all its stages had taken place on German soil, and that it had been ordered on the proved guilt of espionage and treasonable correspondence on the part of Schnaebeler, yet the Emperor would command liberation, being "guided in so doing by the doctrine of international law that the crossing of a frontier, when done on the strength of an official agreement between the functionaries of neighboring states, must always be looked upon as carrying with it the tacit assurance of a safe-conduct."

Treason Trials at Leipsic.—The evidence on which the arrest of Schnaebeler was made was that of a commercial agent of Strasburg, named Tobias Klein, and of letters of Schnaebeler found in the latter's possession. Klein and Martin Grebert, a manufacturer of Schiltigheim, were arrested in February on suspicion of having furnished Col. Vincent, the head of the French bureau of military intelligence, with plans of the fortifications of Strasburg and Metz, and other information. Klein confessed that he had acted as a spy since 1880, receiving 200 marks per month for his services. The letters that he had from Schnaebeler were written in disguised terms, having the appearance of correspondence on family subjects. Grebert

maintained similar relations with the French commissary of police at Avricourt. Baron Schleinitz, an ex-captain in the German army, was tried by court-martial for treasonable practices, and his sentence of three years' hard labor was confirmed in April. Sarauw, a Danish captain, who had been sentenced to twelve years' imprisonment for high treason, furnished the German with details of the French spy system, and was rewarded for his disclosures by afterward receiving his liberty. At the end of May a chancery clerk at Strasburg, named Cabannes, and another functionary of the name of Brückner, were arrested as spies. An employé in the Government lithographing establishment, August Glausinger, who had furnished Cabannes with secret printed documents, was also arrested.

On June 18 a trial for treason-felony of eight Alsatians, who were charged with belonging to the French Patriotic League, was begun at Leipsic. It was shown that the *Ligne des Patriotes*, which was founded at Paris in May, 1872, to promote the reacquisition of the provinces, had established rifle clubs and gymnastic and vocal societies in Alsace-Lorraine, and that pamphlets, newspapers, and song-books designed to keep alive French patriotic sentiments had been disseminated. The prisoners confessed to having contributed funds to the League, but denied that it had any treasonable or political object. They were sentenced to several years' confinement, and were consigned to the casemates of the fortresses of Glatz and Magdeburg.

Klein and Grebert were brought to trial on July 4. It was shown that Klein, who was once a mason and architect, and had been a sergeant in the French army in 1870, but afterward adopted German nationality, had forwarded to Paris information regarding the German method of mobilization, the commissariat, the garrisons, armaments, equipments, the dimensions of forts and trenches, and even a complete plan on a large scale of the fortifications at Mayence. He made a complete confession, and gave information against his fellow-prisoner and brother-in law, but was sentenced to six years' imprisonment as a common felon, while Grebert was sentenced for five years, and Erhardt, keeper of a restaurant, who was implicated, was acquitted on the ground of lack of criminal intention. The trial of Cabannes and his accomplices took place in November.

The Raon Incident.—On September 25 M. de Wangen, a sub-lieutenant of French cavalry, and M. Brignon, his game-keeper, while shooting on the former's estate, were fired on by a German soldier who had been detailed to act as a forest guard and prevent poaching on the German side of the boundary at Allarmont, near Vexincourt, in the Vosges, and in the neighborhood of the town of Raon. Lieut. de Wangen was slightly wounded, and his companion was struck in the abdomen, and

died after suffering great agony for five hours. The affair was investigated by the French and German Governments, and, as in the Pagny incident, there was conflicting testimony as to whether the Frenchmen were on the German or French side of the line. Richard Kaufmann, the soldier who fired the shots, mistaking the party for poachers, testified that he summoned them to halt three times before shooting, though M. de Wangen did not hear the command. The incident was closed by the German Government's paying an indemnity of 50,000 marks to the widow of M. Brignon, and promising to prosecute the offending soldier. Negotiations were entered into for the settlement of a better *modus operandi* on the frontier in order to prevent the recurrence of similar painful affairs. After the shooting the French Government found it necessary to adopt stringent regulations to prevent molestation of German officials on French soil.

Illness of the Crown Prince.—Apprehensions in regard to the health of the Crown Prince, which began to be felt in the summer, have caused in Germany, not only sadness, but a feeling of doubt and distress regarding the political future, for high hopes were entertained of his prospective reign by a large section of the German people. Before he attended the Jubilee of the Queen in England a troublesome ailment affected his throat which almost deprived him of the power of speech. His wife persuaded him to place himself in the hands of Dr. Mackenzie, an English specialist, who found a growth on the larynx, which he concluded was of a warty nature, and not cancerous, as was feared by German physicians who had examined his throat. He was confirmed in this opinion by the result of a microscopic examination by Prof. Virchow, of Berlin, of a small portion that was removed. On Dr. Mackenzie's advice the excrescence was cut away, and for a short time the patient was much relieved, but soon the growth reappeared. A second operation had no better result. By the counsel of his physician the prince went to Italy as cool weather approached, in order to have the benefit of a milder climate. When alarming symptoms again showed themselves, Vienna physicians in lectures and medical journals assailed the diagnosis of the English doctor, and condemned his treatment from the beginning, declaring that the malady was cancer, and that an early excision of the larynx might have eradicated it. In this they expressed a common conviction of the German medical profession. The subsequent return of a more favorable condition revived the hope that Dr. Mackenzie had not erred in his diagnosis.

The Session of 1887-'88.—The Reichstag was opened on November 24. The speech from the throne spoke of a gratifying improvement in the finances, which was expected to increase when the new sugar and spirit duties should begin to show their full effect, and produce a surplus for the next year of 50,000,000 marks.

In view of this a beginning would be made with the long-deferred plan of increasing the salaries of certain state functionaries. While other departments of industry were flourishing, agriculture was in a depressed state owing to foreign competition, and consequently a protective duty on grain would be proposed. In continuation of the economic legislation foreshadowed in the Imperial message of Nov. 17, 1881, the Reichstag would be asked to deal with a bill for providing state assistance to old, infirm, and unemployed workmen, and to extend accident insurance to classes not yet provided for; also to consider a law for the regulation of co-operative societies, and one for applying to the wine-trade the principles adopted in regard to the adulteration of food. The speech concluded with the following allusions to foreign affairs:

The foreign policy of His Majesty the Emperor is successfully endeavoring to strengthen the peace of Europe—the maintenance of which is its object—by cherishing friendly relations to all powers, as well as by treaties and alliances which aim at obviating the dangers of war, and at making common cause against unjust attacks. The German Empire has no aggressive tendencies, and no wants that could be satisfied by victorious wars. The unchristian inclination to fall upon neighboring nations is foreign to the German character, and neither the Constitution nor the military institutions of the empire have been fashioned with a view to disturb the peace of our neighbors by wanton aggression. But for the warding off of such aggression, and for defending our independence, we are strong, and with God's help will become so strong that we can calmly confront every danger.

The Workmen's Insurance Bill.—The new installment in the Chancellor's scheme of social legislation that was promised in the Imperial address, was brought before the Reichstag in December. The bill provides that all workmen who pass the age of seventy, or become permanently and completely incapacitated for work, shall have a pension. Like the previous acts, it affects only workmen, apprentices, servants, and administrative employes having a yearly pay of not more than 2,000 marks. The pension to these is to be due, however, only if contributions, or, in ordinary insurance language, premiums have been paid on their behalf during a certain length of time, which is to be thirty years in case of the pension for old age and five years in case of that for disability. We say contributions must be paid on their behalf, for here, as in the case of the other insurance acts, contributions are paid only in part by the workmen themselves. Not more than one third is paid by them, another third is paid by the employers, and the last third comes from the Imperial Treasury, that is, from taxation of the community at large. The pension in case of old age is 120 marks per year; that for disability varies from a minimum of 120 marks to a maximum of 250 marks, according to the length of time for which contributions have been paid. The sums seem pitiful enough; possibly they have been made small intentionally, in order not to take away

all incentive to independent saving or all occasion for calling on children or other relatives for help. The contributions per workman are fixed for the present at 6 pfennigs per day, or 86 marks per fiscal year. The employers have to advance two thirds of this, or 4 pfennigs per day, but may deduct 2 pfennigs per day from the stipulated wages of the workmen, so that their net charge is 2 pfennigs per day. The rest of the contributions, as was noted above, is paid by the empire. For women the payments are two thirds of those for men, and the pensions correspondingly less. These contributions, or premiums, are, it should be said, merely provisional. Within ten years after the act goes into effect, a new and permanent scale is to be prepared, based on the experience of the workings of the act and of the sums it calls for. The managers of the pension system are the *Berufsgenossenschaften*, or associations of employers, which were organized in order to carry out the system of compulsory insurance against accident. This utilizes the existing machinery and effects an obvious saving of expense. The *Berufsgenossenschaften* are to establish separate accounts for the new system, and the funds are to be kept distinct from those collected for insurance against accident.

The Triple Alliance.—The secret treaty of alliance between Germany, Austria-Hungary, and Italy is supposed to have been renewed and signed by the representatives of the three powers at Vienna, on March 18. The apprehensions of war were directed, in the latter part of the year, more toward Russia than toward France. The tension between Germany and Russia, which the Chancellor had before denied, was revealed by the attitude of the German press, and the interest of Germany in the Balkans was no longer strenuously disavowed. The renewal of the triple alliance was made certain by the visit of Signor Crispi at Friedrichsruhe, where he had a long conference with Prince Bismarck early in November. This visit removed the apprehensions of the Italians regarding the attitude of Germany in the Papal question. The results of the meeting are supposed to be in this respect that Germany admits that the Pope is an Italian subject, under Italian jurisdiction, and therefore outside of the possibility of interference of other nations between the Pope and Italy.

It was feared that the death of Signor Depretis would weaken the bonds uniting Italian policy with that of Germany and Austria; but these bonds have been strengthened under Signor Crispi, who, on his return home, announced that Italy had allied herself with the two empires for the maintenance of European peace. He also intimated that an understanding between Italy and England had secured the *status quo* in the Mediterranean. The German press gave prominence to these statements; and it is generally understood that if Austria should be menaced by Russia or Germany by France, the Italian army will

form part of the defensive system, and the English fleet, in conjunction with the Italian navy, will be able to guarantee the coasts and the ports of Italy against a French descent.

Colonies.—There have been taken recently under the protectorate of the Imperial Government the following territories in Africa: (1) The territory of Togo on the Slave Coast, with the districts of Porto Seguro and Little Popo; (2) the territory of Cameroon, bounded on the north by the right bank of the Rio del Rey and on the south by the Campo river; (3) the territory on the west coast of South Africa, bounded by the left bank of the Counene river on the north, and on the south the Orange river, with the exception of Whale Bay, and extending to territories in the interior acquired by treaty; (4) the territories of the negro chiefs of Usagara, Nguru, Useguba, and Ukami, described in the patent of protection issued on February 27, 1885; (5) the territory of Vitou.

On March 28, 1887, the territory of Victoria, which was under the protectorate of Great Britain, was formally handed over to the German authorities to be thenceforth incorporated in the colony of Cameroon, in accordance with an agreement between the two governments.

In the Pacific ocean the protection of the Emperor has been extended over the Marshall Isles, which have an area of 110 square kilometres and 10,000 inhabitants, and over the regions acquired by the Company of New Guinea. The latter comprise King William's Land, situated on the northeast coast of New Guinea, with an area of 179,250 square kilometres, and 109,000 inhabitants; the Bismarck Archipelago, with 52,200 square kilometres of land surface, and 188,000 inhabitants; and the portion of the Solomon Islands that is situated north of the line of demarkation agreed on between Great Britain and Germany on April 6, 1886, having an area of 22,000 square kilometres, and about 80,000 inhabitants.

GRAND ARMY OF THE REPUBLIC. However objectionable secret societies may be on general principles, the fact of their wide-spread existence is an indisputable proof of their popularity. They are found in all nations and under all conditions of civilization and barbarism, and, after an ineffectual struggle to suppress them, even the most conservative of our universities and colleges have been forced to make the best of them and recognize their influence as one of the elements of social life that must be accepted, and, if possible, converted to good and useful ends. No combination of persons can exist, indeed, without some interior affairs of its own which it is not policy to give to the world at large.

It is not strange, therefore, that when the idea of a society of veteran soldiers was first conceived it should have been deemed wise to organize it with a system of signs, grips, and passwords, which may seem very unnecessary

to outsiders, but have their uses in strengthening the bond that unites its membership.

Springfield, Illinois, was the birthplace of the Grand Army of the Republic, better known by its initials as the G. A. R. During the winter of 1865-'66, a considerable number of soldiers who had served in the armies of the United States were gathered in the vicinity of Springfield, and Dr. B. F. Stephenson, late surgeon of the Fourteenth Illinois Infantry, was so prominent in perfecting the organization that to him belongs the credit of having founded the now powerful, prosperous, and well-organized association that numbers its members by the hundred thousand.

After much discussion among the original projectors, it was decided that the element of secrecy was best adapted to further the objects of the order, and at the first regular meeting a ritual was adopted, with prescribed oaths and ceremonies of initiation, and the association was launched with a purpose that has been most successfully carried out.

The first post was formed in Decatur, Illinois, on the night of April 6, 1866, and the entire staff of compositors of the Decatur "Tribune" being, as it happened, eligible to membership, was mustered in. This enabled the young fraternity to have its printing done with closed doors, and four hundred copies of the ritual were soon printed and bound for distribution. The town was placarded with notices like the following: "G. A. R., Post No. 1, Decatur, April 6, 1866," and in a short time a large proportion of the veterans in the neighborhood had applied for membership. The objects of the order, as publicly announced, were as follow:

First: To preserve and strengthen those kind and fraternal feelings which bind together the soldiers, sailors, and marines who united to suppress the late rebellion, and to perpetuate the history and memory of the dead.

Second: To assist such former comrades-in-arms as need help and protection, and to extend needful aid to the widows and orphans of those who have fallen.

Third: To maintain true allegiance to the United States of America, based upon a paramount respect for and fidelity to the national Constitution and laws; to discountenance whatever tends to weaken loyalty, incites to insurrection, treason, and rebellion, or in any manner impairs the efficiency or permanency of our free institutions; and to encourage the spread of universal liberty, equal rights, and justice to all men.

The organization of Post No. 1, at Springfield, was soon followed by that of Post No. 2 at the same place, and Dr. Stephenson was recognized as Provisional Commander-in-Chief. In the mean time, other associations having the same general end in view, seeing the advantage of united action, dissolved their organizations, and were duly received into the Grand Army of the Republic.

On October 31, 1866, a call was issued for a National Convention, which was held in Indianapolis November 20, with representatives present from Illinois, Missouri, Kansas, Wisconsin, New York, Pennsylvania, Ohio, Iowa, Kentucky, Indiana, and the District of Columbia. Gen. Stephen A. Hurlbut, of Illinois, was elected Commander-in-Chief, with Dr. Stephenson as his Adjutant-General.

The second general meeting, which was the first officially named an "Encampment," met in the council chambers of Independence Hall, Philadelphia, Jan. 15, 1868, and Gen. John A. Logan was chosen Commander-in-Chief. At this time, owing to various dissensions, the order experienced a period of depression. It was charged with being a secret political organization, and, during the two or three years that followed, its membership was largely reduced by resignation, and the loss was hardly balanced by new recruits. The constitution and by-laws were revised and adapted to the requirements of the case, resulting eventually in renewed vitality, and in its establishment on a basis of assured prosperity. Under the present constitution the following named persons are eligible for membership: Soldiers and sailors of the United States army, navy, or marine corps, between April 12, 1861, and April 9, 1865, in the war for the suppression of the rebellion, and those having been honorably discharged therefrom after such service, and of such State regiments as were called into active service and subject to the orders of United States general officers between the dates mentioned, shall be eligible to membership in the Grand Army of the Republic. No person shall be eligible who has at any time borne arms against the United States.

The order has from the first taken a prominent part in the observance of Decoration Day, or, as it is now more appropriately known, Memorial Day. May 30 of each year has been set apart as a national holiday; banks and public offices are closed, and the survivors of the National armies meet at their respective posts and march together to decorate with flowers and appropriate devices the graves of their former comrades. A simple uniform has been adopted similar to that worn in the service, and the occasion is an impressive one in almost every considerable town and village in the Northern United States.

When on duty, or on occasions of state and ceremony, members of the Grand Army—"comrades" as they are officially termed—wear the badge designated as No. 1 in the illustration. No. 2 is the officers' badge, No. 3 the past or retired officers' badge, and No. 4 the button worn when off duty and in civilian's dress. The cross-bars designate the rank of the wearer according to the insignia of the United States Army, and all the metal-work is of bronze, made from cannon captured during the civil war. The commanders-in-chief of the Grand Army have been as follows, the

dates and places of their election corresponding with the annual encampments as indicated:

1. Stephen A. Hurlbut, of Illinois, Indianapolis, Nov. 20, 1866.
2. John A. Logan, of Illinois, Philadelphia, Jan. 15, 1868; re-elected (3) at Cincinnati, May 12, 1869; and again (4) at Washington, May 11, 1870 (died Dec. 26, 1886).
5. Ambrose E. Burnside, of Rhode Island, Boston, May 10, 1871; re-elected (6) at Cleveland, May 8, 1872 (died Sept. 8, 1881).
7. Charles Devins, Jr., of Massachusetts, New Haven, Conn., May 14, 1873; re-elected (8) at Harrisburg, Pa., May 13, 1874.
9. John F. Hartranft, of Pennsylvania, Chicago, May 12, 1875; re-elected (10) at Philadelphia, June 30, 1876.
11. John C. Robinson, of New York, Providence, R. I., June 26, 1877; re-elected (12) at Springfield, Mass., June 4, 1878.
13. William Earnshaw, of Ohio, Albany, N. Y., June 17, 1879.
14. Louis Wagner, of Pennsylvania, Dayton, O., June 8, 1880.
15. George S. Merrill, of Massachusetts, Indianapolis, June 15, 1881.
16. Paul Vandervoort, of Nebraska, Baltimore, June 21, 1882.
17. Robert B. Beath, of Pennsylvania, Denver, July 25, 1883.
18. John S. Kountz, of Ohio, Minneapolis, July 23, 1884.
19. S. S. Burdette, of Washington, D. C., Portland, Me., June 24, 1885.

An organization so powerful in numbers and influence could not but excite animosities based upon supposed political sympathies, and as early in its history as 1869 it was deemed best at the annual encampment, held that year in Cincinnati, to adopt the following rule:

"No officer or comrade of the Grand Army of the Republic shall in any manner use this organization for partisan purposes, and no discussion of partisan questions shall be permitted at any of its meetings, nor shall any nominations for political purposes be made." It is one thing to pass such a resolution, and quite another to carry it out in letter and in spirit. In the nature of things it was unavoidable that members should become candidates for office, and that members already holding public office should be prominent in the conduct of Grand Army affairs, but it is believed that in a remarkable degree unseemly partisanship has been avoided, and certainly no formal action has at any time been taken that can fairly be construed as a deliberate violation of the rule cited. Another charge that has been brought against the organization is that it tends to keep alive the bitter memories of the civil war, but such charges have never come from the soldiers of the Confederacy. Indeed, its relations with similar organizations among veterans of the Confederate service have ever been most friendly, and upon several occasions ex-soldiers

of both armies have met and fraternized on the most amicable terms.

The order is constantly active in aiding deserving applicants for pensions, and in exposing unworthy attempts—and they are many—to defraud the Government through unjust claims. During the year more than \$258,000 have been officially expended in the relief of families of deceased and dependent soldiers, and probably an equal amount has been contributed by members in a private way calling for no official record. During the sixteen years from 1871 to 1886, the sum of \$1,173,688.60 has been disbursed for charitable purposes. These large sums have been distributed directly to those whose needs were personally known to the donors, and it is probable that very little has gone to unworthy pensioners. Twice within a few years, during the yellow-fever epidemic in the Mississippi Valley and immediately after the Charleston earthquake, it was deemed proper to issue a general call for aid to sufferers, a large majority of whom must have been on the side of the rebellion during the civil war. In both instances the order has promptly and generously responded with pecuniary assistance. The latest accessible figures place the total present membership at 872,674, and the number of recruits during 1887 numbered about 47,000. The order is in fact a supplementary pension bureau. That it should take an active part in making known its sentiments in regard to the Government bureau, is to be expected. Its members are now too far advanced in life ever again to bear arms in defense of the republic, but their influence is still potent for loyalty and good government. (See LOYAL LEGION and MEDAL OF HONOR.)

GREAT BRITAIN AND IRELAND, a monarchy in western Europe. The supreme legislative power is exercised by Parliament. Parliaments hold their sessions annually, meeting about the middle of February. The session is usually closed by prorogation about the middle of August. Parliament is divided into two houses. The House of Lords is composed of hereditary peers; peers created by the sovereign, English bishops, who have seats *ex officio*, Irish peers, who are elected for life, and Scottish representative peers, who are chosen anew for each Parliament. In 1886 the House of Lords consisted of 549 members, of whom 5 were peers of the blood royal, 2 archbishops, 22 dukes, 20 marquises, 118 earls, 29 viscounts, 24 bishops, 285 barons, 16 Scottish peers, and 28 Irish representative peers. There are 20 Scotch and 65 Irish peers who have no seats in the House of Lords. The House of Commons consists of 670 members, of whom 283 represent county constituencies; 360, boroughs; and 9, universities. For England there are 258 county, 237 borough, and 5 university members; in Scotland, 39 county, 31 borough, and 2 university members; in Ireland, 85 county, 16 borough, and 2 university members.

The elections of 1886 resulted in the return to Parliament of 818 Conservatives, 78 Liberal Unionists, 194 Gladstonian Liberals, and 85 Irish Home Rulers, giving a normal majority to the Conservative government, which was formed in opposition to Mr. Gladstone's scheme of home rule for Ireland, of 112 in a house of 670 members. The metropolis sent 48 Conservatives, 11 Gladstonians, and 8 Liberal Unionists; the rest of England elected 287 Conservatives, 116 Gladstonian Liberals, 49 Liberal Unionists, and 1 Irish Home Ruler, who was returned for one of the divisions of the city of Liverpool; Wales returned 4 Conservatives, 24 Gladstonians, and 2 Liberal Unionists; Scotland returned 12 Conservatives, 48 Gladstonians, and 17 Union Liberals; and in Ireland 17 Conservatives, 2 Liberal Unionists, and 84 Home Rulers were elected. Of the 285 Conservatives elected in England the boroughs returned 98, besides the 48 London members, the county districts 185, and the universities 4. Of the Welsh Conservatives 8 represent boroughs and 1 a county constituency. In Scotland 1 borough, 9 county districts, and both the universities of Edinburgh and Glasgow are represented by Conservatives. In Ireland the universities, 4 boroughs, and 11 county constituencies sent Conservative members to Parliament. Liberal Unionists were elected by 2 of the districts of London, 16 other boroughs, 38 county districts, and 1 university; by 1 borough and 1 county constituency in Wales; by 8 boroughs and 9 county districts in Scotland; and by 2 county divisions in Ireland. Gladstonian Liberals were returned from 11 of the divisions of the metropolis, 50 other borough constituencies, and 66 county constituencies in England; from 7 boroughs and 17 county districts in Wales; and from 22 boroughs and 21 county districts in Scotland. The Irish members were returned from 12 Irish boroughs, 1 English borough, and 72 Irish county districts.

The representation act of 1884, with the redistribution act of 1885, increased the number of voters from 8,152,919 to 5,707,531. The number of county electors was increased in England from 966,719 to 2,536,580; in Scotland, from 99,652 to 325,529; in Ireland, from 165,997 to 631,649. The number entitled to the borough franchise was increased in England from 1,651,732 to 1,840,044; in Scotland, from 210,789 to 285,051; in Ireland, from 58,021 to 106,109. The 32,569 electors who choose the 9 university representatives under the act of 1885 were formerly included in the borough electors. The total number of voters was increased in England from 2,618,451 to 4,391,260; in Scotland, from 810,441 to 574,358; and in Ireland, from 224,018 to 741,913. An act passed in 1872, requiring parliamentary elections to be by secret vote and by ballot expired in 1880, but has since been continued from year to year. The Parliament which was opened in August, 1886, is the 24th of

the United Kingdom and the 12th of the reign of Queen Victoria.

The executive power is exercised, in the name of the sovereign, by the Cabinet. The Prime Minister, who usually holds the office of First Lord of the Treasury, is the representative of the majority in the House of Commons. He selects his colleagues and dispenses all the patronage of the Government.

The reigning sovereign is Queen Victoria I, born May 24, 1819. The heir-apparent is Albert Edward, Prince of Wales, born Nov. 9, 1841. His eldest son, Prince Albert Victor, born Jan. 8, 1864, is next in the order of succession.

The present Cabinet, constituted on Aug. 8, 1886, and reconstructed on Jan. 14, 1887, is composed of the following ministers: Prime Minister, the Marquis of Salisbury, born in 1830, who on Jan. 14, 1887, exchanged the post of First Lord of the Treasury for that of Secretary of State for Foreign Affairs, which he had held when Prime Minister before in 1885-'86; Lord High Chancellor and Keeper of the Great Seal, Baron Halsbury, formerly Sir Hardinge S. Gifford, who filled the same post in Lord Salisbury's former Cabinet; First Lord of the Treasury, W. H. Smith, previously Secretary for War, who received his present appointment on Jan. 14, 1887; Lord President of the Privy Council, Viscount Cranbrook, formerly Gathorne Hardy, who was made a peer in 1878, and was President of the Council in the former Conservative Cabinet; Chancellor of the Exchequer, George Joachim Goschen, who was formerly affiliated with the Liberal party, and more recently with the Liberal Unionists, and who received his appointment on Jan. 14, 1887, succeeding Lord Randolph H. S. Churchill, who had withdrawn from the Cabinet; Secretary of State for the Home Department, Henry Matthews; Secretary of State for War, Edward Stanhope, who was Colonial Secretary before the reconstruction of the Cabinet; Secretary of State for the Colonies, Sir Henry Thurstan Holland, who was transferred from the post of Vice-President of the Council to a Cabinet office on Jan. 17, 1887; Secretary of State for India, Viscount Cross, who was Home Secretary in the last Conservative Cabinet, and was raised to the peerage in 1886, having been previously, Sir Richard Cross; First Lord of the Admiralty, Lord George Hamilton, who held the same appointment under Lord Salisbury before; Lord Chancellor of Ireland, Lord Ashbourne, formerly Edward Gibson, member of Parliament for Dublin University, who was Attorney-General and Lord Chancellor of Ireland under previous Conservative governments, and was created a peer on resuming the latter office in 1886, and given a seat in the Cabinet; Chief Secretary to the Lord Lieutenant of Ireland, Arthur J. Balfour, who received the appointment on the resignation of the office by Sir Michael Hicks-Beach, having previously had a seat in the

Cabinet as Secretary of State for Scotland; Chancellor of the Duchy of Lancaster, Lord John Manners, who was Postmaster-General in 1885; President of the Board of Trade, Lord Stanley de Preston, formerly Sir Frederick Stanley, who was Secretary for the Colonies in 1885; President of the Local Government Board, C. T. Ritchie, who was given a seat in the Cabinet; Minister without a portfolio, Sir Michael Hicks-Beach, who retired from the Irish secretaryship in March, on account of ill-health, but retained a seat in the Cabinet. A. J. Balfour was succeeded as Secretary for Scotland by the Marquis of Lothian, who is not a member of the Cabinet.

Area and Population.—The British Empire covers an area of 8,981,130 square miles, or 23,260,100 square kilometres, and has a population, according to the most recent enumerations, of 310,735,840 persons.

The area of the United Kingdom is 120,832 square miles, exclusive of water areas, but including the Isle of Man and the Norman Islands. The annual computation of the Registrar-General for 1887 makes the population of England 28,247,151, of Scotland, 8,991,499, and of Ireland, 4,852,914. Including the population of the adjacent islands and the soldiers and seamen abroad, as returned in the census of 1881, the total population of the United Kingdom is 37,448,198.

The vital statistics for England for the last five years reported are as follow:

YEARS.	Marriages.	Births.	Deaths.	Surplus of Births.
1882	204,405	889,018	516,654	372,364
1883	205,884	890,722	522,997	367,725
1884	204,801	906,750	590,828	315,922
1885	197,745	884,270	522,750	361,520
1886	195,506	903,216	537,078	366,138

The statistics for Scotland were as follow:

YEARS.	Marriages.	Births.	Deaths.	Surplus of Births.
1882	26,574	126,182	72,966	53,216
1883	26,555	124,462	76,567	47,895
1884	26,061	122,041	75,125	46,916
1885	25,256	126,110	74,608	51,502
1886	24,469	127,927	73,622	54,305

The returns for Ireland give the following results:

YEARS.	Marriages.	Births.	Deaths.	Surplus of Births.
1882	22,029	122,648	88,500	34,148
1883	21,263	118,168	96,228	21,940
1884	22,568	118,376	87,154	31,221
1885	21,777	115,961	90,719	25,242
1886	20,681	118,995	87,376	31,619

The emigration from the United Kingdom to the United States from 1815 to 1886 was 7,486,636; to the British provinces of North America, 1,855,678; to Australia and New Zealand, 1,567,931; to other countries, 438,834, making in all 11,344,079. In 1886 the number of emigrants who left Great Britain, including 94,370 foreigners and 3,531 of un-

known origin, was 230,801. There were 83,066 English and Welsh, 16,786 Scotch, 52,858 Irish, and 85,676 foreign passengers whose destination was the United States. Of the 146,810 English emigrants, 18,886 sailed for Canada, 88,764 for Australia, and 10,585 went to other countries and colonies, exclusive of those whose destination was the United States. Among the 25,928 Scotch who emigrated, 2,971 were destined for British America, 4,240 for Australia, and 1,826 to other countries. Of the 61,276 Irish emigrants, the number who departed for Canada was 2,888; for Australia, 5,072; and for other countries, 458. The number of immigrants into Great Britain in 1886, including the foreign emigrants passing through, was 108,879.

The population of the chief cities of Great Britain and Ireland, as computed by the Registrar-General in 1886, was as follows: London, 4,088,928; Liverpool, 579,724; Glasgow, 519,965; Birmingham, 427,769; Dublin, 358,082; Manchester, 337,842; Leeds, 338,189; Sheffield, 305,716; Edinburgh, 250,616; Bristol, 218,169; Bradford, 214,431; Nottingham, 211,424; Salford, 204,075; Hull, 186,292; Newcastle, 158,209.

Commerce.—The total value of the imports of merchandise in 1886 was £349,863,000, as against £370,968,000 in 1885, and £390,019,000 in 1884. The value of the exports was £268,667,000, as against £271,404,000 in 1885, and £293,968,000 in 1884. The total volume of commerce was £618,530,000 in 1886, as against £642,872,000 in 1885, and £685,987,000 in 1884. The exports of British products amounted to £212,433,000 in 1886, as against £213,045,000 in 1885, and £233,025,000 in 1884.

The commerce with the principal commercial nations in 1886 was as follows, in pounds sterling:

COUNTRIES.	Imports.	Exports.
United States	81,600,000	26,925,000
France	84,699,000	12,614,000
Germany	21,422,000	15,676,000
Netherlands	25,810,000	8,196,000
Belgium	14,248,000	7,127,000
Russia	18,372,000	4,424,000
China and Hong-Kong	9,597,000	7,560,000
Sweden and Norway	10,227,000	3,271,000
Portugal	9,112,000	1,687,000
Egypt	7,357,000	2,856,000
Turkey	4,155,000	5,906,000

The declared value of the imports of precious metals in 1886 was £20,864,000, of which £18,892,000 were gold and £7,472,000 silver; the exports were £21,007,000, comprising £18,784,000 of gold and £7,223,000 of silver. British colonial possessions participated in the import trade to the extent of £81,884,000, the imports from India amounting to £32,131,000, from Australia and New Zealand to £20,954,000, from British North America to £10,415,000, from British South Africa to £4,671,000, from Singapore to £4,378,000, and from other colonies to £9,840,000. The exports to British colonies amounted to £75,507,000, of which

£81,840,000 went to India, £22,388,000 to Australasia, £7,889,000 to British America, £3,804,000 to South Africa, and £10,591,000 to other possessions.

The values of the chief exports of British produce for 1885 and 1886 were as follow:

EXPORTS.	1885.	1886.
Cotton piece goods, white or plain.....	30,565,477	32,230,614
Cotton prints and dyed goods	17,704,187	17,919,684
Other cotton fabrics	4,689,979	7,194,701
Cotton yarn	11,665,294	11,468,508
Total cotton manufactures	64,624,837	68,812,607
Iron, pig and puddled	2,092,816	2,252,944
Iron, bar, bolt, angle, and rod	1,680,454	1,873,065
Railroad iron	3,906,259	3,656,733
Iron wire	689,286	554,264
Thin plate	4,427,695	4,690,484
Hoops and plates	2,268,148	2,153,703
Wrought iron	4,018,105	3,979,241
Old iron	261,435	336,379
Steel, wrought and unwrought	1,492,540	1,863,141
Total iron and steel	21,770,788	21,732,951
Cloths and coatings	8,907,320	9,165,491
Flannels, blankets, and bala	938,638	942,315
Worsted stuffs	6,566,810	6,943,261
Carpets and druggets	1,183,433	1,231,961
Other woollen fabrics	1,975,288	1,464,658
Woolen and worsted yarn	4,882,395	4,406,676
Total woollen manufactures	23,239,951	24,144,257
Machinery	11,096,669	10,183,600
Coal	10,693,151	9,626,839
Linen manufactures	4,961,098	5,957,574
Linen yarn	984,539	985,068
Jute manufactures	1,920,599	1,934,718

The values of the principal articles of import, in pounds sterling, were in 1885 and 1886 as follow:

IMPORTS.	1885.	1886.
Grain and flour	51 55	43,225,439
Cotton, raw	81 12	37,792,413
Wool, sheep and other	2 63	22,807,687
Sugar, raw and refined	11 62	15,997,867
Wood and timber	11 60	12,580,670
Metals	11 67	15,089,548
Bacon and hams	1 68	6,379,342
Animals	1 73	7,143,430
Butter and butterine	11 06	10,099,846
Tea	11 90	11,360,460
Silk manufactures	11 90	10,683,423
Flax, hemp, and jute	1 83	7,152,990
Chemicals, etc.	1 64	7,952,148
Oils	1 21	6,049,148

The quantities of the chief imports in 1885 and 1886, given in hundredweights, except where otherwise designated, were as follow:

IMPORTS.	1885.	1886.
Grain and flour	144,012,468	125,221,396
Bacon and hams	4,062,454	4,199,347
Fish (cured or salted)	764,252	681,625
Refined sugar	5,829,046	6,867,027
Raw sugar	19,416,759	16,141,006
Butter and butterine	2,401,373	2,429,977
Cheese	1,683,060	1,723,197
Beef	1,141,846	901,981
Preserved meat	527,759	480,846
Fresh mutton	571,646	652,259
Sheep and lambs (number)	730,846	1,088,967
Cattle (number)	373,076	319,621
Eggs (great hundreds)	8,856,568	8,613,163

The quantity of grain and flour imported, per head of population, in 1885, was 235·79

pounds, as compared with 155·85 pounds in 1869; of sugar, 74·28 pounds, as compared with 42·56 pounds; of bacon and hams, 11·47 pounds, as compared with 2·68 pounds; of butter, 7·15 pounds, as compared with 4·52 pounds; of cheese, 5·48 pounds, as compared with 3·52 pounds; of tea, 5·02 pounds, as compared with 8·68 pounds.

Navigation.—The total tonnage of vessels engaged in foreign commerce entered at British ports in 1886 was 81,035,618, of which 22,741,061 tons were under the British, and 8,294,557 under foreign flags. The steam tonnage entered was 24,410,809, of which 19,791,481 tons were British and 4,619,328 foreign. The total tonnage cleared was 81,805,459, of which 23,387,238 tons were British. The steam tonnage cleared was 24,992,884, British steamers being represented by 20,250,706 tons. The aggregate burden of vessels entered with cargoes was 24,778,693; cleared, 29,171,079. The aggregate tonnage of vessels in the coasting trade entered in 1886 was 44,005,833; cleared, 37,420,204.

The number of vessels on the registers of the United Kingdom in 1886 was 22,409, of 7,821,000 tons, of which 6,630, of 3,962,000 tons, were steamers. The number of vessels registered in British colonies was 15,143, of 1,924,000 tons. The number of sailing-vessels built in Great Britain in 1885 was 459, of 208,411 tons; the number of steamers, 393, of 196,975 tons.

Railroads.—The number of miles of railroad in operation in the United Kingdom at the end of 1886 was 19,332, of which 13,678 miles were in England and Wales, 3,022 in Scotland, and 2,632 in Ireland. The cost of construction was £828,344,000. The gross receipts in 1886 were £269,592,000, as compared with £269,556,000 in 1885; the net receipts, £33,073,000, as compared with £32,768,000.

Posts and Telegraphs.—The number of letters transmitted by the post-office during the year ended March 31, 1887, was 1,460,000,000; post-cards, 179,000,000; newspapers and printed matter, 520,000,000; parcels, 32,860,000; postal orders for the United Kingdom, 9,800,000, of the aggregate amount of £21,952,000; for foreign countries and the colonies, 300,000, of the amount of £763,000; from foreign countries and British colonies, 700,000, of the amount of £2,218,000.

The length of telegraph lines in April, 1886, was 80,276 miles, with 170,195 miles of wire. The gross receipts from the postal telegraphs in 1886 was £1,758,169, and the net revenue £25,343. The number of inland telegrams forwarded in the year ended March 31, 1887, was 50,243,639, of which 42,320,185 were in England and Wales, 5,106,774 in Scotland, and 2,816,680 in Ireland.

Finances.—The financial year 1886-'87 showed better results than were originally anticipated. The estimates of revenue adopted by Sir William Harcourt, who was Chancellor of the Ex-
